

PLANTING OPINION.

A WEEKLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS OR PLANTERS.

Madras:
Printed by ADDISON & CO., Mour Road.

1897.

INDEX.

VOL. 2.

FOR THE YEAR 1897.

GOVERNMENT BOTANICAL GARDEN

LIBRARY.

Section.....

No.....

EXPLANATORY NOTICE.

The Index this year is divided into only four sections, *i.e.*, General, Coffee, Tea and Round the Bungalow, each being alphabetically arranged and carefully cross-indexed. The Index headings are not in every case identical with the headings of the articles or paragraphs, but as the former have been chosen to denote the gist of the articles they refer to, no inconvenience will be felt on that score.

A

	PAGE.
Absconding maistries	392
Act XIII of 1859. Interesting conviction.	29
" Warrants	170
" Important Ruling, 438,	442
Acacia decurrens	371
Accountants on Estates	413, 514
Advances	350, 439
Africa, A Planter in	353, 410

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, JANUARY 9, 1897.

[No. 1.

MANAGER'S NOTICE.

Back Numbers Wanted: One each of Nos. 16, 27, 29 and 30, at one rupee per copy, or exchanged as below.

Offered in exchange or at eight annas per copy Nos. 2, 3, 5, 7, 9, 10, 13, 18, 19, 20, 21, 22, 23, 26, 28, 31, 32 and 33.

N.B.—It is particularly requested that the names and addresses of the senders be legibly written on the covers of the papers despatched.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd January 1897.

N. Mysore.

YEDAHALLI.—A few days of rain just before and on Xmas day freshened up young plants but rather interfered with crop operations. Leaf-disease decreasing. General health good. Rice 11 seers, ragi 16 seers. Grain 14 seers. Weather cleared up again and east wind howling.

South Mysore.

GONIBEDE, 4th January.—Crops are very short. I have never known them so short of estimate in all my experience of over 12 years. Crops, like hawkers' prices, can be reduced by one half. When you come to where it is, it isn't there (as the Irishman said). The crop seems to have been only on the surface, which has no doubt misled many, if not all, planters. To make matters worse, leaf-disease has come on like, well, like anything, you know!

Central Travancore.

PEERMAAD, 23rd December 1896.—Weather.—Rainfall for December to date 1.27 inches. Crops.—Tea not flushing much now; land wind very strong and is making the leaf tough and hard. Almost every estate is laying down large nurseries

for next year's clearings and supplying old ones. Labour.—Generally good, though still short on some few estates.

Coorg.

POLLIBETTA.—Weather.—Cloudy and hot but no rain. We have had no cold weather so far; nights warm. Crops.—Picking going on. Some places stripping and commenced pruning. Crops short; London market will be short of East Indian this year. Plant-diseases.—These are picking up again, and the attack of leaf-disease in November going off. General Health.—A slight improvement amongst coolies. It has been a bad season for fever, colds and pneumonia. Labour.—All extra hands will be paid off within the month; just enough being kept on to prune and do any manuring required this time of year.

North Wynaad.

6th December 1896.—Weather.—For first fortnight of December there was only 10 cents of rainfall on one day and drizzling showers on three days. Crops.—Ripening of coffee became a very quick process after the abundant rains, and when the second picking, now proceeding, is finished, there will not be much crops left to gather. Paddy-cultivators have their hands full with harvesting work. Plant-diseases.—Very much less leaf-cast in coffee than at time of last report. General Health.—Good, but some fever about. Grain.—Common rice 10, and ragi 28, large seers per rupee. General Remarks.—A hole has been made in the Karticolam jungle by way of a commencement of the springing into existence of a full-blown estate of 200 acres. A few days since I had a look at last season's planting and am of opinion that, if it continues to jump along as it is now doing, Karticolum will be the show-place of Wynaad for coffee.

Nilgiris.

KOTAGIRI.—Rainfall, 1896, Kotagiri in. 55.21, Kotagiri ghant 41 @ 51, Kodanad 60.27, Orange Valley 50.75. Weather has cleared up since last report. A little more rain up to middle of the month would not be objected to. Crop ripened up in torrents of rain in November and December up to Xmas day. The rush in such inclement weather could not be kept in hand. A good deal is in. A good deal is on the ground on lowlying estates and not

PHELPS & CO., Fashionable Tailors and Costumiers, 16, Old Court House Street, Calcutta. (Ladies' Department: 4, Russell Street.)

much more to come in. Outturn very disappointing and estimates not to be realised. Leaf showing up. Pruning begun on stripped fields. Health good, but cholera at the foot of the hills keeps out influx of coolies. Grain rates unjustifiably high.

PYKARA. 4th January 1897.—*Weather.*—December 15th to 31st rainfall in. 2·70, for the year in. 78·50. During the month weather was moist and foggy and no frost fell. *Crops.*—A good flush all over the estate. *Plant-diseases.*—Nil. *General Health.*—Good. *Labour.*—Plentiful.

SHOLUR.—The year closed with 55·66 inches rain, 3·55 of which fell in December. The weather has been unusually warm since last report, the day temperature in shade between 6 A.M. varying from 50° and 64°. Tea still continues to flush slightly—and as I write prospects of more rain—which will be good for pruned tea and an early start next year if happily it is not nipped by frost. Labour plentiful and prices of grain steady.

COONOR, 8th January.—Weather has now set in clear and cold, and there is more than a suspicion of frost in the air. The rainfall for December totalled 18 inches, against an average of past four years of not quite 6½ inches. Total for year 70·69 in., which is just about an inch above average. Fears of a wet spring may thus be put aside. Lower elevation estates have got in quite half their crops, which, on revised estimates, is coming about up to the mark. Leaf-disease showing up in a nasty way. Generally speaking crops are poor and much under the average, as it seems is general all over South India. Tea has stopped flushing or very nearly so. On the whole the crops of tea in the district have been good and above the average, though the first half of the year was so bad. Labour plentiful, health indifferent. Grain rates about the same but still high, i.e., ragi 18 measures instead of the old 26 measures per rupee.

GENERAL NOTES AND ARTICLES.

Our Planter's Library.

Some changes that we are now making in the management of this branch will, we trust, result in considerable benefits to our readers. Our next issue will contain a considerably longer list of useful books to planters, and will include many scientific works sure to be appreciated by the "New Generation."

Our Index.

With this issue we give our index for Volume I., which we hope will be found of some use to our readers. It is not so elaborate as we could wish, but will doubtless serve for purposes of reference. We shall be glad to register orders for special cloth bound covers for binding, which we shall advertise in our next issue.

Wild dogs.

"Twenty-five of these," writes a correspondent, "have taken up their quarters on N. Hay, Pykara, Nilgiris, and slew three sambur in two days inside the boundary, and I came across nine spotted deer, one jungle sheep in full cry right among my new clearing, going like smoke, but they did not trample down any plant."

Fibre in the Wynaad.

The property at Pundalur (Wynaad), known as the "Mango Range" has been secured, says the *Nilgiri News*, by a Company in England, with the object of being opened out as a Fibre plantation, and Mr. H. Punnett, the Local

Director, is busy making extensive nurseries of "Sansveria Zelanica" for planting out next monsoon.

The Cattle of Mysore.

One of the most interesting of the last batch of *Agricultural Ledger* series forwarded us is entitled "The Cattle of Mysore" and contains a store of valuable information to all interested in the management or breeding of cattle. The official number is Oxen, 1895—No. 24, and it may be purchased from Messrs. Higginbotham and Co., Madras.

A Labour Agent for Ceylon.

We notice that Mr. G. L. Yonge, of the Planters' Agency, Madras, sometime Secretary to the U. P. A., publishes a notice in the Ceylon papers giving the terms and conditions under which he is willing to engage coolies for the Island. It might be worth Mr. Yonge's while to lend his valuable services to South Indian planters. The commission demanded is Rs. 10 per head payable on embarkation.

The fruit market.

Elsewhere a correspondent alludes to the orange industry of Coorg, which province enjoys a notable reputation in the matter of its "loose-jackets." The curious thing is, that with the considerable quantity of fruit available in other districts such as the Nilgiris, no remunerative or even regular market exists. Very little encouragement is wanted to develop a most important fruit-growing industry in all those planting districts within reasonable distance of either a railway or a port.

Effects of Moisture.

According to M. Edmond Gain, the influence of moisture on vegetation varies much at different periods of their growth. Water, as a rule, is greatly needed when the first leaves appear; then little is wanted until just before the blossom shows, when the supply should be copious. The fruit is perfected best in comparative dryness. Moisture in the ground favours increase in the number of fruit, seeds, and roots, but dryness promotes the size and perfection of fruits, seeds, and tubers.

Season Reports.

A subscriber writes as follows:—May I suggest that you ask your Season Reporters to make the reports as far as possible applicable to the whole district for which they correspond, or if this be impossible to attach the name of the estate on which they reside in order that reports may carry just such weight as to which they are entitled.

Our correspondents, we trust, will please take the hint and do what they can in the matter. To obviate any wrong impressions in the future, we are printing the dates of each report, a matter which should have been attended to before.

Malaria.

The U. P. A. S. I. recently suggested to the Government of Madras that an inquiry should be made into the question of the development of the malarial parasite on somewhat similar lines to the investigation undertaken by Surgeon-Major H. Ross and others. After a reference to the Surgeon-General, the Madras Government has decided to address the Government of India on the subject.

This subject was started early last year, it will be remembered.

PHELPS & CO., Calcutta, have probably the largest and best assorted stock of Woollens in India and will be pleased to send patterns and form of self-measurement.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better one, or in want of a manager, assistant, or writer, &c., is entitled to insert an advertisement to that effect *free* for as long a period as desired. These advertisements will appear on this page. Non-subscribers will be charged the small fee of one rupee.

To be worked in conjunction with the above, we have established a register, and names will be entered on application, together with copies of their testimonials. Thus should any enquiries be made for the services of a manager, assistant, &c., the names and testimonials will at once be forwarded, saving delay and trouble. Subscribers may have their names entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO**A Surveyor**

Of 25 years' experience, trained in the Imperial Survey Department of India and Engineering College, Roorkee, is prepared to undertake extensive Trigonometrical, Topographical and Engineering Surveys and Levelling and make working plans on the largest scale at somewhat the same rates as the Government Cadastral Surveys which will vary with the area and scale of the survey and amount of detail required.

Full particulars on application to

A. HALL,
C/o Editor.

Field Overseers.

Field Overseers from November 1896 in opening new clearing. Salary Rs. 20 to 25 per mensem. Natives only need apply.

Apply to A. H. SHARP, Esq.,
Devikulam.

Coffee Writer.

Wanted on a Coffee Estate an Under-Writer who understands field work and accounts. Must be young, active, and willing. Must speak and write English well.

A labour connection is necessary. No one without these qualifications need apply. Good salary.

M. A. T., C/o this paper.

BILLETS WANTED BY**By Young Planter.**

Wanted a billet on Coffee Estate by young planter of three years' experience under well-known planters. Excellent testimonials.

"ROCHESTER,"
C/o Editor.

Young Coffee Planter.

Wanted by a young planter, charge of a Coffee Estate. Experienced in all branches. Salary Rs. 200.

"D. D.,"
C/o Manager.

Tea or Fruit.

Wanted an appointment as Manager or First Assistant in tea or fruit. Ten years' practical experience, well up in the cultivation and manufacture of tea, and also in the management of English fruit trees. Bachelor, age 29, active, hard working, sober habits, excellent testimonials and information from the Manager of this paper. Can join at once.

KUMA.

Coffee Planter.

Wanted a situation in Coffee as Superintendent or Manager by a European with over twenty years' experience.

u. c.

Apply D.,
C/o Manager.

Superintendent.

Wanted a billet as Superintendent of a Coffee Estate by a planter of 14 years' experience; testimonials and references given if required.

u. c.

Apply PADDY,
C/o this paper.

Tea Planter.

In 5 to 6 months time by a Managing Proprietor about to sell property, an appointment as Superintendent of a Tea Estate or a large tea house preferred. Mincing Lane and Assam experience. Command of Labour.

Apply T.,
C/o this paper.

Coffee Assistant.

Employment by a young European, aged 24, of steady habits, as an Assistant on a Coffee Estate. Has had experience in this line.

Address

R. A. G.,
C/o Manager, Daily Post Press,
Bangalore.

SHORT ADVERTISEMENTS.**NOTICE.**

THE cost to subscribers of short advertisements is One Rupee for every three insertions of five lines or less. To non-subscribers a charge of Two Rupees will be made.

N. B.—Advertisers should state exactly the number of insertions required, failing this the advertisement will continue running until stopped and will be charged for accordingly.

OFFERED.**Rhea Seed.**

Good available at Rupees Five per ounce. This is the cheapest way of securing plants of this valuable fibre plant.

WILLIAM BROS. & CO.,

u. c.

Heneratgoda, Ceylon.

Sturdy Pony.

FOR SALE.—Handsome bay Persian pony cob, sturdy and well bred, 4 years, 13-3, believed sound. A superb saddle nag, with snaffle mouth, and if trained to harness would make a grand trapper. Price Rs. 500.

Apply "DANDY DICK,"

Three.

C/o Manager of this Paper.

Coffee Estate.

FOR SALE.—A valuable Coffee Estate, in a good district, 100 acres in bearing, 25 young, 55 acres now being opened, 300 acres forest.

Apply EL. L.,

u. c.

C/o Editor.

PHELPS & CO., 15, Old Court House Street, Calcutta, will be glad to send to any address particulars and illustrations of their Riding Habit "Ideal" Riding Breeches, "Acme" Trouser Belt, "Cycling" Scarf, "Muskil" Bow, and "Jemizone" Knot; all patented.

Camera, &c. FOR SALE.—One time and instantaneous Hand Camera, R. R. lens, and complete outfit, almost new.
One 450 bore G. A. Pistol in case with implements.
One large Shikar knife.
One lady's saddle with Scott's patent safety stirrup.
Everything in perfect order.
u. c. Apply "B B B" C/o Manager.

Rifle. FOR SALE.—450 Express, mail canvas case, re-loading and re-sizing Tools and some ammunition. In perfect order.
Apply 303, MANAGER, *Planting Opinion*.
u. c.

Boys' Own Paper. Five Vols. "*Boys' Own Paper*" (1889-94), in good order. Price Rs. 20; offers considered.
u. c. Apply XNAW, C/o EDITOR.

Shevaroy Seed Coffee. Shevaroy Seed Coffee, New Crop, price per bushel Rs. 25 delivered at Salem station. Apply J. C. LARGE, *Cascades, Yercaud*.
One.

A Level. FOR SALE.—A level by Troughton and Simms, in case, with tripod and levelling staves.
Complete and in good order. Price Rs. 300. Open to a reasonable offer.
Five. Apply "AJAX,"
C/o EDITOR, *Planting Opinion*.

THE LABORATORY,
OOTACAMUND,

D. HOOPER, F.C.S., F.I.C., February 20th, 1896.
Quinologist to the Government of Madras.

A. BROWN, Esq.,
Podanur.

Tannery Refuse. This is to certify that I have analysed a sample of "Tannery Refuse," received on the 7th February 1896, and find it to contain

Moisture	...	...	8.80
*Organic matter	...	...	69.84
Lime as carbonate	...	...	9.23
Potash salts	...	...	1.20
Magnesia, &c...	...	...	2.47
Sand	...	...	8.46
			100.00

*Containing nitrogen ... 3.43
[Equal to ammonia ... 4.83]

This analysis of "Tannery Refuse" shows a great improvement on samples called by this name that have passed through my hands. The ammonia is much higher than it was in the last specimen, and the mineral constituents are well distributed. I consider this substance a very useful fertiliser.

D. HOOPER.

Price Rs. 20 per ton delivered in neat bags in Calicut, and slightly cheaper at Mettapalaiyam.
Two.

There are so many cheap imitations of Ellwood's helmets in the market that it is a comfort to know that
PHELPS & CO. keep Ellwood's only.

450 Express for Sale.

D. B. 450 Express by Joseph Lang and Sons, fitted with Lyman and Beach Sights. Price Rs. 350. Apply to
C. W. G. MORRIS, Esq.,
CHAMARAJNAGAR,
Mysore.

One.

To Small Capitalist.

FOR SALE Rs. 6,000.—A newly-built brick Mangalore Tiled Bungalow, in about 50 acres of land, suitable for fruit growing or coffee cultivation under shade. Rainfall 80 inches. Only 3 miles from Taluk Headquarters, Govt. Dispensary and Post and Telegraph Office. A good road leading to bungalow only ½ mile off Government Road.

Apply sharp BUNGALOW, EDITOR, "*Planting Opinion*," Coonoor.

Bangalore Orchard. FOR SALE £500 STERLING.—An orchard in good order within Civil and Military Station, Bangalore, S. India, in a seven-acre block. Water available; containing a nice strongly-built 8-roomed Cottage, with large outhouses and stabling for 3 horses.

Estimated annual rental value £18. Fruit and other crop returns £18 per annum.

Further particulars, apply

ORCHARD,

u. c.

C/o "*Planting Opinion*," Coonoor.

English Home and Education. A lady living at the seaside, in the healthiest part of County Cheshire, with her three daughters, who have had highest certificated education, are willing to receive and educate English children, either boys or girls, any age up to 12 years.

A thorough knowledge of English, French, German, Music, Drawing, Dancing imparted to the pupils.

Young and delicate children most conscientiously looked after.

Terms and particulars on application to

Z. Z., C/o Manager.

u. c.

SOUTH COAST OF ENGLAND.

St. Leonards on Sea, Ancaster House.

English Education.

The Rev. Frank R. Burrows, M.A., Trinity College, Oxford, receives Boys to prepare for Public Schools and Royal Navy. Ages 7 to 14. High and healthy situation, home comforts. Terms 50 to 70 guineas per annum. References kindly permitted to, and particulars to be had from, C. A. Martin, Esq., LL.D., Darjeeling, and Lt.-Col. G. C. Dobbs, I.S.C., Commissary-General, Bengal Command, Naini Tal.

Tea land, &c.

Tea land at high elevation, also coffee land, for sale, or partnership to open. Particulars to

T. C.,

Editor of this Paper

u/c.

bered, by the Nilgiri Planters' Association, and created much senseless amusement at the time.

An old Wynaad Gold Co. Mr. Wright, in his interesting notes on South East Wynaad, which will be found on another page, gives a graphic account of the rise of gold-mining in the district. Curiously enough the last home mail brings us news of the voluntary winding up of the Southern India Alpha Gold Mining Co., started so far back as 1874. Everything had been tried, though it must be confessed in a rather half-hearted way, to prove their Wynaad mines, including the cyanide process for tailings, but all to no purpose. Hence the winding up of the Company. The wonder is, that it was not wound up long ago.

Government purchases of cinchona-bark. Referring to the para. in our last issue *re* the purchase of bark from planters by Government, we learn that as Dr. King has been granted a special allowance in Bengal, a similar allowance is expected to be given the Madras Quinological Department. Certainly it is true that Government and planters will find it mutually advantageous, now that price is so low. But it is a pity that the purchases cannot be conducted by auction, instead of by private treaty, as by the present system there is bound to be a great deal of dissatisfaction felt by those planters who are left out in the cold. It is manifestly impossible for personal visits to be paid to every cinchona estate in South India, and it is unfair, though at present unavoidable, that the more accessible ones should be specially favoured.

Insecticides. A reader sends us the following clipping from the *Indian Agriculturist*, in the hopes that some of the recipes for spraying may be of use to planters:—

1. The extract of 7 lbs. of quassia, obtained by boiling quassia-chips in water, to 100 gallons of water, and 6 lbs. of soft-soap.
2. The extract of 4 lbs. of quassia-chips to 100 gallons of water, with 5 lbs. of soft-soap and 5 pints of paraffin.
3. The extract of 4 lbs. of quassia-chips to 100 gallons of water, with 4 lbs. of soft-soap and 4 pints of carbolic acid, Calvert's No. 5.
4. Six pounds of soft-soap, and 2 lbs. of finely-ground hellebore and a quart of paraffin, boiled and well stirred. This is sufficient for 100 gallons of water.

"Paris Green" is also recommended, with reservation, its poisonous nature being against it. It costs, says the Board, 10d. to 1s. per lb. The paste is to be preferred, 1 lb. of it being mixed with 200 to 280 gallons of water for spraying the trees; but it should not be used when the trees are in blossom.

Price of money. Ceylon is making a fuss just now because a well-known Island planter managed to effect a mortgage in England, on his tea estate, at the rate of five per cent. This, they say, compares exceedingly well with the old coffee days, when the cheapest rates both at home and locally varied from 10 to 8 per cent. But it is nothing so very extraordinary after all, as in more than one case we wot of personally, loans have been raised on *coffee* estates in South India at six per cent., or only just one per cent. dearer than on Ceylon tea. As a matter of fact, the rate of interest depends very largely on the proportion of the loan to the value of the property. A hundred thousand rupee estate would find no difficulty in getting twenty thousand or so at, say, six per cent., while for

every five thousand above that sum, an extra one per cent. would most likely be charged.

A hint.

In replying to the short advertisements published in this paper, we should be obliged if our readers would address their communications direct to the advertisers, so that their letters can be forwarded without trouble or delay. In not a few instances lately, we have been personally asked for details of such and such an article, whether a certain book had coloured plates, or who X. Z. D. might be, who was advertising land for sale, and whether the land was worth anything, and so on. Now it would save the applicants much time, and ourselves much trouble, if they were to address their queries to X. Y. Z., or whatever the initials or *nom de plume* may be, c/o the editor of this paper, when their letters will be forwarded unopened to the advertiser. Most people would think such a course very obvious, but others, as mentioned above, do not.

Bee-keeping simplified. Under the heading of "Bees and the Fertilization of the Coffee Blossom" published in our "Coffee Notes" will be found some interesting directions in starting a country apiary. There are certain obvious precautions to be taken, however, against thieves, both four and two-footed, which can be hit upon at the expenditure of a little ingenuity. Each hive should only cost about four annas, if made of wood, while the return (especially in those estates which either are not kept too clean-weeded, or else have large grass reserves) should run out to about five rupees per annum. If properly extracted, the honey should have a far superior flavour to the usual country mixture of wax and oil, and even higher profits might be realized. By the way, talking of country honey, many a planter's wife could earn a round little sum in pin-money by buying honey and wax from the Kurrumbars and other jungle tribes. The former might be cleaned and sold either locally or in Madras or Bangalore at cheap rates, while the latter could be accumulated till a few cwt. were collected, when it would fetch a good price either in the country or in London. Home prices are about £6 per hundredweight.

Says the *Produce World*:—

Beeswax, bananas and vanilloes. Another item of news to West Indians, which should be exceedingly interesting, is the fact that dealers are advertising what we would consider just fair parcels of *Jamaica Beeswax* at the modest price of 1s. 8d. per lb.—remembering how Colenso used to teach us to calculate, this works out at something in the neighbourhood of £10 per cwt. Now we know for a fact that senders are contenting (?) themselves with something like £8, possibly £8 2s. 6d. per cwt. Someone gets the £2—who is it? Why is it?—and can no remedy be supplied for such a system of trading, which to term "rotten" would be putting it very mildly. In regard to the recent arrival of *Bananas* from the West Indies, and the growing interest which is being taken in banana flour, we took it upon ourselves to submit to Dr. Allinson a sample of this flour which a West Indian correspondent was good enough to submit to us a short time back for our inspection. Dr. Allinson is firmly of opinion that the fruit shipped in the form of flour would be taken up very strongly by the public if once supplies were taken into this port. It would seem that banana flour is very largely used in the West Indies, when mixed with milk, as a substitute for arrowroot, as a remedy in cases of diarrhoea. The sustaining qualities possessed in banana flour are undoubted, and it would without doubt according to the Doctor constitute a most valuable invalids' food. Short length *Vanilloes* are very scarce and

It is not too much to say that PHELPS & CO. are the most popular high-class Tailors in India.

wanted badly in London just now. Mauritius, Bourbon and Fiji shippers would do well to note this state of affairs—now let it be understood when we refer to shippers that we do not refer to the local dealers who collect all the produce they can at the different ports from the little men who are up country, and who have the trouble in the first place of collecting the produce, albeit they are of course kept in sweet ignorance of the state of affairs and prices ruling in the London market, to which port their stock eventually finds its way. Four to 5 inch beans are quoted at 23s. to 27s. per lb., 8 to 9 inch are realising 32s. per lb., and 6 to 7 inch 27s. to 28s. per lb.—the stock of this produce in London up to the time of going to press is somewhat heavier than it was some little time back, but as the prospect of demand seems decidedly healthy, we quite look for prices to be fully maintained.

Vanilla Cultivation and Curing.

In the Seychelles the cultivation of vanilla is proving very profitable, says the *H. & C. Mail*. Mr. Cockburn Stewart, the administrator of the islands, in his report to the Colonial Office, mentions that the flowering of the vanilla during the latter end of 1895 gave a good promise for the crop of 1896, and the expectations then formed are being realised. The crop now being gathered will, it is estimated, reach 30,000lb., and the prices for vanilla this year are exceptionally high. The flowering has already begun this year, and there is every prospect of a large crop for 1897. Seychelles vanilla is now most favourably known on both the London and Paris markets, and commands a remunerative price. Next to coconut oil, it is the most important product of the Seychelles, and in a good year the crop gives a return of about Rs. 40,000. Unfortunately, vanilla is a most capricious plant, and, whereas there may be a good crop for two consecutive years, there may also be a period of three, or even four years without any crop at all.

The *Chemist and Druggist* of Sept. 26 has the following replies to a correspondent:—

E. P. (Fiji).—(1) Curing of Vanilla.—After the pods are plucked they are dipped in boiling water. Next they are packed in hardwood cases, 6 feet long, 4 feet wide, and 2 feet deep. A blanket is first put in the box, then the beans to about the depth of a foot, and a double thickness of blanket on the top of them. The box is then covered with glass, and placed in the sun for a fortnight, during which time the beans ferment, or sweat. Only experience can tell when that process is complete, and the beans are ready for the dry shed. This should be an airy shed, well protected from rain, and not too much exposed to the sun. It should have a series of wire shelves all round it and on the top shelf the beans are placed in single layer, not too crowded. They are turned over every day or second day, and in the course of ten days removed to the second shelf, then to the third, where they remain until they are quite dry and fit for packing.

Cinchona.

The following vigorously written remarks in our contemporary, the *Produce World* (which by the way is now published monthly instead of weekly), will be thoroughly appreciated by many of our readers:—

It is, after all is said and done, you know, only natural that the East India folk should "swear a trifle," when the prices paid here for Cinchona bark crop up as the topic of conversation. And whence comes in the reason for the low rates now ruling? The position of the stocks here is certainly in sellers' favour, being something like 8,000 packages short of what they were a year ago, and at that period buyers were being asked to pay more money than the price at which it is being quoted at to-day. It is really little to be wondered at that the owners of the East Indian estates should be sending home from time to time the loud complaints on the question of prices realized for parcels sold. *Apropos* of Cinchona bark, a

friend was telling us a day or two since, that having occasion for a not altogether retail quantity of this article, he had to pay a fraction under sixpence per pound for quality which we could hardly call good quill. Now please do not lose sight of the fact that the shipper would in all probability receive less than threepence per lb. Where then does the other threepence per lb. go to? We fear there is only one reply to make to this, that it is eaten up by commissions; what a pity it seems to be that the actual consumer cannot have it a little cheaper—and the actual producer receive a little more money than the seemingly idiotic rates quoted by the broker.

Sooner or later, there will be houses cropping up in London, who will be quite willing for a commission to have forward from India parcels of three or four hundred packages of Cinchona Bark from the Indian Estates, with which they will go around and nett for the Consignor the price the consumer is willing to pay, and which we undertake to say will work out better than 3½d.—we will even say 3½d. per lb. for good renewed quill. It may be argued that travelling expenses, postages, and other incidental expenses—necessary to the perfection of this *modus operandi*—will detract too much from the nett price obtained. We, however, contend that there will be plenty of margin left to meet such expenses—in any event one might safely and with confidence calculate on being able to obtain figures which will rank fully fifty per cent. better than 2½d. for crown renewed.

The Indian Tea Association.

From an abstract of the proceedings of a meeting of this Association on the 7th ultimo, we note the following items of general interest:—

The Sub-Committee had before them a letter from the Government of Bengal, Public Works Department, dated 15th October, forwarding papers with details of a scheme for improving and extending the system of roads in the Dooars, the cost of which was roughly estimated at Rs. 8,25,000, and the charges for maintenance at not less than Rs. 65,000 per annum. The matter had been deferred for further consideration, pending communication from the Dooars Planters' Association and others having local knowledge. The Sub-Committee, as far as they could judge, were of opinion that the scheme was a satisfactory and comprehensive one.

Approval was expressed on the proposed agitation for the removal of the tea duty at home.

The Committee noted that Dr. Watt, Reporter on Economic Products to the Government of India, when in London had had interviews with Mr. J. N. Stuart and Mr. A. G. Stanton, in the course of which Dr. Watt had expressed his opinion that insect blight would not seriously affect the life of the tea plant, but that he was much more afraid of the fungus blight which had been seen on tea for some years, and which might at some future time, possibly become virulent, as had happened with coffee in Ceylon. Dr. Watt had also stated that blight was caused by the overworking of the tea plant, and that he had never observed fungus blight on any tea plants in their wild indigenous state. The Committee considered these remarks were well worthy the attention of Planters, and would be quite prepared to take up the question of the appointment of a Scientific Officer, as soon as funds would permit, but it would hardly be possible to raise these while the American Market Fund was continued.

Legumes : a query answered.

It has doubtless struck many of our readers, as a curious anomaly, that, in the case of legumes, you can eat and yet have your cake. That is to say, a field ma

They have no pretensions to cheapness, nor do they advance any such claims, but PHELPS & CO understand their business.

Coffee Land.

FOR SALE. A BARGAIN.—A block of 210 acres of good Coffee Land in the Nilgiri District, planted with 20,000 4-year old coffee trees. No difficulty about labour. Grazing plentiful. Manure 1 a. per bushel delivered.

Apply to "BARGAIN,"

C/o Editor, P. O.

Saddle.

FOR SALE.—A good saddle and bridle by Parsons, St. Martin's Lane. Used only once—imported last year. Can be seen at Mr. Lexewich's Agency, Bangalore.

PERCY W. WOOLLEY,

Nellacottah.

Good Land.

FOR SALE.—Block of 1,000 acres, situated in the best district of Wynaad for the early showers; average annual rainfall 80 inches, with an average in January, February and March of over 5 inches.

Government Road from Coast to Mysore bisects the Property which is moreover bounded on the North and West by large rivers, each containing ample power throughout the year to drive Overshot Water Wheels.

The greater portion of the land faces North, North-East, and North-West, with a very easy lay, and the soil is admirably fitted for the growth of Arabica and Liberian Coffee, as well as of Tea. For further details apply to 303, C/o MANAGER, *Planting Opinion*.

A Pony.

For Sale B. A. Pony "Hankey," about 13-3. Goes in harness and under saddle, but requires to be blind-folded when mounting. A good hard-working animal. Price Rs. 250.

Apply P. GUARD,

Cherambadi, Wynaad.

Surveying.

The undersigned (at present engaged in carrying out large contract surveys for the Perak Government) is willing to send survey parties to any part of India to undertake the Surveys of Estates, Villages, Roads, Rail roads, Zemindaries and Inams, including Triangulation and Topography or any other class of Survey. Estimates for work will be given upon information as regards nature of work required being forwarded addressed

ALMA BAKER,

BATU GAJAH, PERAK,

Straits Settlements.

Coffee Land.

FOR SALE.—On easy terms, a block of 1,000 Acres of land in Wynaad, suitable for Tea.

Apply "SOUTH,"

C/o Manager, *this paper*.

Eucalyptus Preparations.

Eucalyptus Boiler Disincrustator at 12 annas per gallon in 40 gallon barrels. Eucalyptus Oil at 3/8 per 27 oz. bottle.

Apply T. BROWN,

"Glendale," Coonoor.

WANTED.**Tea Estates.**

WANTED to purchase a couple of good tea estates. Send full particulars to T. T. LEONARD, 4, Gordon Avenue, Bangalore. Two.

Papers and Magazines.

WANTED.—Back Numbers of the following Magazines:

Chambers' Journal.—FIFTH SERIES—Vols. I. and IV. complete, bound or unbound (embracing Nos. 1 to 12 and 37 to 48 inclusive).

Offered 1 Re. each for any of the following Back Numbers:—

Chambers' Journal.—Nos. 74, 76, 63, 64, 65, 94, 95 & 96.

All the Year Round.—Part No. 47 (Nov. '92). Jan. to June (incl.) '93.

Cassell's Family Mag.—Monthly part for Jan. '93.

Family Herald, " " " Feb. '94.

The Young Man, " " " Sept. & Oct. '94.

Also Aug. & Sept. '93.

Offer 8 annas each for the following:—

The Planter.—Nos. 8 to 16 inclusive of Vol. IV.

Exchange for any of above—copy for copy or at 1/ each.

Boy's Own Paper.—Parts No. 160, 163 & 170 to 176 (inclusive).

Chambers' Journal.—No. 87 (fifth series).

Review of Reviews.—Parts for Dec. '93, Sept. '94 & Jan. '96.

Offered at 4 as. per copy or exchange.

The Young Man.—Parts for Aug. to Dec. '92 (inclusive)—June '92 and April '94.

The Planter.—Nos. 9, 10, 14, 17, 18, 21, 23, 30, 32, 34, 35, 42, 50 & 52 of Vol. III.

Apply "PLANTERS' LIBRARY,"

be sown with, say, peas or horse-gram or other leguminous crop. The crop above ground may be totally removed, and yet the soil will be found to be considerably richer than before. A correspondent alludes to the matter having puzzled him, and evidently has made up his mind that it is absurd. And yet perhaps there is no fact more familiar to the scientific agriculturist of to-day. It is a very simple matter. Leguminous plants derive from the atmosphere, by means of their root-tubercles, large quantities of nitrogen. This nitrogen is stored up in all parts of the plant, roots, leaves, stems and seed. If the three latter are removed as crop, there is still a considerable quantity of nitrogen left in the soil stored up in the roots. It is this root-nitrogen that, in these cases, effects such remarkable improvement in the soil for the benefit of the next crop. If planters were not always in such a desperate and often unreasoning hurry to plant up their land after being felled, a very considerable saving in after expenses might be

There are firms who are unscrupulous enough to advertise their Tailoring at cost price, but

MANURES.

Steamed Bone Meal.

Fish Guano.

Whole Fish.

Nitrate of Soda 95% soluble.

Trichinopoly Phosphates.

Poonacs:—Ground Nut and Niger Seed, Castor, Hoongay, Mowra.

Sulphate of Ammonia 24%.

Mixtures can be made in any proportion without extra charge. Also packing to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karapuramba Works, Calicut, the Calicut Railway Station, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for Basic Slag or Phosphate, Kainit Salts, Muriate of Potash, Nitrate of Potash, Sulphate of Potash, Saltpetre, Superphosphates of Lime, 15% Phosphoric Acid, Superphosphates 40%, Soluble Phosphates, and any other Manures not kept in stock. Approximate Analyses of these can be had on application.

affected by judicious cultivation of leguminous crops after clearing. A large quantity of most indifferent land is being planted up every day with either coffee or tea, the success of the clearing depending altogether on the manure supplies. By means of a little forethought the richness of the land could be perhaps quadrupled at very slight expense. After the burn, what would be simpler than to get neighbouring ryots to plough and sow horse-gram or other suitable leguminous crops. The abundant supply of soluble minerals in the ashes of the jungle growth would ensure a most luxuriant crop. The seed crop might be given, in whole or in part, to the ryot in return for his labour, while the straw and roots should be ploughed in to decay in the soil, resulting in an enormous saving in the manure bill for the next few years. True, this would in most cases mean a year's loss in time, though in other cases, where the jungle was "brushy" and an early burn secured, some planting might still be done the same year.

But even in the former case, no real loss of time, which in reality is simply a loss of interest, is incurred if the matter is considered in a business-like manner. The question is merely whether a year's interest, whatever it may be fixed at, is greater or smaller than the saving in manuring expenses effected by the planting of the leguminous crops alluded to. Without the slightest exaggeration, it may be assumed that the green manuring will be worth at least double the money yearly expended on cattle or artificials. Does the interest for one year on the capital exceed this cost, or does it not?

Sisal Hemp Cultivation. In an article in the *New York Times*, Mr. William Drysdale gives some particulars of the sisal hemp ventures, and of the large sums of money they have swallowed up. The writer says those New Yorkers who have lost money in it will not be likely to see anything romantic in the story of sisal hemp. But the others will, and the others are in the majority. With the losers it is a sore subject, for they are small investors, who cannot afford to lose much—small businessmen, clergymen, public school teachers. In every effort to raise this hemp outside of Yucatan, New York has furnished most of the capital, and has always lost it. After reviewing the history of the sisal hemp fever in the United States, the Bahamas, and elsewhere, the writer implies that until some bright Yankee will devise a machine to extract the fibre more cheaply than the slaves of Yucatan can do it, sisal hemp as a speculation for Americans can be classed only with Colonel Sellers's infallible eye-water. In this connection Mr. D. Morris, C.M.G., at the London Institution, on Monday, delivered an interesting illustrated lecture on "Recent Researches in Commercial Fibres." After referring to the great use made of the cotton plant as grown in America, he observed that the raw material obtained from the cotton tree was now attracting considerable attention. The tree was a native of the East Indies, but had been introduced into the western tropics. The floss was first of all exported from Java, immense quantities had been sent to Australia, and the article was well known on the Continent. The tree was very fast-growing, and in Jamaica alone a great trade might be built up out of its products. After describing flax and jute plants, the lecturer went on that Manilla hemp—the product of the wild

banana—was almost entirely grown in the Philippine Islands. Attempts had been made to cultivate it elsewhere, but without success. This description of hemp occupied a commanding position in the market, but good progress had been made with sisal hemp, manufactured from a species of aloe grown in the Bahamas. The trade in China grass and ramie, or rhea, would probably achieve great dimensions, especially as problems on which large sums of money, time, and ingenuity had been expended now seemed to be in a fair way of solution. China grass and ramie were both of the stingless nettle tribe, and after chemical treatment were capable of yielding beautiful textile materials. It was a pity that the two plants were so often confused, and that there was so little knowledge concerning them amongst those who sought to experiment with the fibres. Ramie was a tropical plant, and could well be grown in the West Indies. It might be that its cultivation would materially assist the dwellers in the West Indies in their present predicament, even if it did not entirely take the place of the sugar industry. When the importance of this fibre was recognised they might expect to see manufacturing springing up in the West Indies for its treatment near the place where it was raised. Ramie could be easily propagated in such a climate, and made to yield satisfactory profits.

SKETCHES OF THE PLANTING DISTRICTS OF SOUTH INDIA.

III.

S. E. WYNAAD.

(BY ADOLPHUS ARTHUR WRIGHT.)

(Continued from our last.)

The Chetty.

First is the Chetty; he is the ryot, cultivator of the soil. His customs are more Malabaree and the Maramakatayam; he cultivates rice, ragi, and sammay fields, and gets only one crop in the year, but his habits are lazy. He does not highly cultivate his fields, and seems quite satisfied with whatever the field yields. The Chettis live in hamlets far off from each other, surrounded by their rice fields, and with a few coffee trees around their houses, they are allowed to grow up to any height; and whatever they yield they gather and sell to Moplah merchants. They have their swamy temples near their village, to which they sacrifice goats and fowls. They drink deeply arrack and the sago palm toddy; these trees are also grown by them purposely for the toddy.

The Kurumbar.

The next race of aborigines is the Kurumbar tribe; these men were all gold washers in former years; they dig and wash up auriferous galleys. They work at it from morning to night, and after a week or so they clean up, and pan the gravel containing the alluvial gold. This gold they used to sell to the ryot as a rule—the man who owns the land—the price they used to get for the gold was at the rate of six pies for one paddy grain weight, which calculated came to Rs. 20 for one rupee weight of gold. They sometimes sold the gold to Moplahs who used to supply them with quicksilver. For panning off the alluvial gravel, the Kurumbar uses a hollow wooden dish about two and half feet long and two feet wide, scooped out of a soft kind of a timber. While panning off, a certain quantity of quicksilver is put in the dish, which catches all the fine gold and turns it into amalgam, which is then put on a live coal; the quicksilver evaporates and the gold is left in a lump. In the olden [How about last year?—Ed., P. O.] times, the fall of rain in Wynaad used to be very heavy, and the Kurumbars used to cut water races over hills which they knew to be auriferous. They dug up a space of some two or three hundred yards, and let down the water accumulated in their water races and dams. Sometimes they came across good-sized nuggets.

PHELPS & CO. rely on excellence of workmanship and good taste in building up the biggest Tailoring trade in India.

I have known a lucky Kurumbar to get a nugget of pure gold worth over one hundred rupees, and which he sold off in pieces at the rate of twenty rupees for *One Rupee* rate. This was the primitive way the Kurumbars used to collect gold, and it is a tedious work. Some of them knew all about auriferous quartz, but they were unable to go to any depth, not having the means to contend with water, and whatever good gold bearing slabs of quartz they could get from their shafts, were burnt in hot fires, ground up finely over a granite rock, and then washed in their wooden dish with the quicksilver. They used to annually destroy large areas of valuable forest by felling and burning it for cultivating ragi, but this has now been put a stop to by Government. From the year 1848, the Kurumbars have gradually discontinued the washing of gold, as they find it pays them better to work on the plantations. They are not only clever with the axe and adze, but also clever in all other works on a coffee estate. Some of them make excellent shikarees. If an adult Kurumbar dies, his remains are cremated, but remains of children are usually buried. Kurumbars live in gangs in their own hamlets, sometimes fifty or a hundred, including their women and children. In the event of a young Kurumbar wanting to take a wife, he has first, through his elders, to get the consent of the girl's parents. First he has to present them with a little money and some cloths (green colour mixed with red is their favourite), and if the parents of the girl are willing, then he has to present his intended with a good cloth, and brass or copper rings for her ears and fingers, (Kurumbars do not wear gold nor silver, but only brass or copper.) After all is ready, the neighbours and elders are all invited, and a grand feast is made with rice (the old fellows taking care to get a supply of arrack for themselves). After all is consumed, then the music and drums go on furiously, the men form a circle round a big fire and dance away to the tune and time of their clarionet and drum until the morning, after which the lucky young fellow with his bride return to his home. The Kurumbar women do not skip like men; they dress themselves neatly, with plenty of saffron applied to their faces. They form a large circle and go round leisurely; they join their two fists and simply make signs with the thumbs which are loaded with brass rings. The women dress very neatly; they use only one cloth, and that goes round a little above their breasts, something like the low neck of a lady's ball dress. There is only one fault in the Kurumbar, and that is, he will never think of going to work until he has eaten all he has saved, and when he finds all his food over, he is obliged to seek work. At the present time the Kurumbar has a little forethought for the morrow; but as a rule, they never turn out to work on a Monday, because on Sunday night they hold a feast and plenty of dancing all night up to morning, and so they are unfit to work on Monday. They work steadily five days in the week, and the lucky planter who possesses a gang of Kurumbars feels happy. One word more for the Kurumbar, and that is, he detests going very close to Canarese or Tamil lines, owing to the filth. A Kurumbar's hamlet is kept clean; they are very particular about this. They are very afraid of cholera and small-pox, and will not approach a coffee estate if they hear of either being present. If any of their own kind are attacked, they all forsake the unfortunate wretch and go far away into the jungle. I had a large gang of Kurumbars in the Devalla district, about one hundred including women and children, in the year 1873. A virulent kind of small-pox broke out in their hamlet, and although they tried their best by deserting those who were ill to die, yet the plague followed them. Some died under rocks and caves, some under trees, and out of my large gang only a dozen or so were spared. This was a sad loss for the estate, of which I was the manager.

The Punnears.

The Punnears were slaves of the Zemindars (large land proprietors) and the Chetties of Wynaad. Their work was to plough the rice fields of their masters, attend to cattle and so on. And after a day's hard labour, they used to get their wages in the evening, not in money, but in kind, and that was two measures of paddy for a man and one measure per woman, nothing more. The poor fellows looked half starved, and it was only during harvest time, and if not watched carefully by their owners, they would steal as much paddy as they could and take it away far into the bush and clean it up for food. The poor Punnear used to be treated severely when found out; besides his daily allowance stopped for a time as punishment for stealing. A coarse cloth is given to the Punnear and his wife on feast days, which happen twice in the year. At the present time the Punnear has

shaken off his bonds of slavery, and lives quite comfortably, as he can always earn his day's wages of four annas on a coffee estate. Anyhow, the Chetty manages with a deal of coaxing and good treatment to get the Punnear to help him to plough his field, and to harvest the same, not being able to use harsh means as in former times. The Punnear well understands the present law that no one can force him to work against his will. They also live in small gangs in hamlets like the Kurumbar. The Punnear also used to dig and wash for gold, but was not so clever at it as the Kurumbar. He is a clever hand with the mamootie in a coffee field, but pruning work could never be knocked into them. During crop time on estates situated close by their villages they often steal coffee at nights, and the planter is put to great annoyance and expense in employing a set of men to watch the field at night. It is only certain thieves who carry on this game; they are not found out; they hide the coffee in the jungle under ground, and after all enquiry, &c., ceases, quietly make over the coffee to their Chetties and cannot be found out, because the Chetty owns coffee trees around his house, and he strips his coffee berries as soon as ever he finds it matured. But of late years, since the Coffee Stealing Act came in force, and by the vigilance of the Police, coffee thieves have become a little scarce. The Punnears have their own swamy under a big tree, and during a feast day they sacrifice fowls or break a cocoanut or so according to their means. The men also dance like the Kurumbar, but their drums and clarionets are much smaller. They do not cremate their dead. The Chetty, the Kurumbar, and the Punnear have two great feasts in the year called Vishoo and Onam; the former happens in the month of April, and the latter in September. The Chetty as a rule must give the Kurumbar and Punnear a good feed that day, and also cheap clothes called "Moondos" in this country valued from four to eight annas a piece. So much about the Punnears.

The Nayakars (Honey Kurumbars.)

The Nayakars (Honey Kurumbars) in former years used to live entirely in the jungles. Their food was honey and wild yam roots, and occasionally a feed of black monkey when netted. They were in a state of almost absolute nudity in the olden times; their only dress being of leaves. At night a firebrand was always held to their chest to keep them warm. They get together under a friendly tree and sleep round a big fire. They collect honey in the following manner. When they find a large tree laden with honey-combs (of this there are sometimes as many as a dozen on a tree), they first tie a long bamboo with its knots perfect as a ladder, this is tied with a strong jungle creeper, close to the girth of the tree, and extends up to the first lateral branch of the tree. This ladder work is done very quietly during day, and at night one of the most daring of the gang climbs up the ladder. He takes with him his torch and his net slung to his shoulder. When he reaches the first branch he gives a song, and after resting a little, he goes on from branch to branch, walking perfectly fearless and cool to the comb—and when he reaches it, he simply points his flaring torch to the bees; he shoves them off quietly with his hand, and takes away the comb without disturbing the bees any further. The Nayakar knows the proper time to take the honey comb; he will always take it when the comb is full with young. After the comb is brought down, they cut it up, roast it a little on fire and then eat it with great relish. They save the wax and sell it to Moplahs who supply them with tobacco. In the year 1848, while my brother Alexander, at the Ouchterlony Valley, was out shikaring in the forest after bison, he suddenly came on a gang of these Nayakars, about a dozen or more, in a state of nudity, quietly enjoying themselves around the fire. The poor fellows got quite powerless and could not move, but my brother got his shikar Kurumbar to speak kindly to them, gave them whatever quantity of tobacco he had, and promised to send them cloths, etc., which he did at once on his return home. In a very short time this gang of Nayakars got quite accustomed to us, and used to come weekly to our stores for rice, salt, etc., and at the present time they have become quite as civilized as the Kurumbar, and work as coolies on some of the estates in the Ouchterlony Valley. The men are also clever with the axe, but not so strong and muscular as the Kurumbar, and now in the Nellakota District there are any number of this race of people working as coolies on coffee estates. The Chetty has a natural fear of the Nayakar, as they believe they can kill a Chetty or even a Kurumbar by some

If their representative has not been in your station recently, PHELPS & CO. will be happy to send him—anywhere, from Quetta to Mandalay.

LEE'S PHARMACY

THE MADRAS EQUITABLE ASSURANCE SOCIETY

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ... Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.),
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} for payment of death claims.

On Policies transferred to the London Register, ^{or} death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Draft on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years, Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to one Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment, during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

Imported "
tribes.

of their mantrams. These are all the four aboriginal races in South-East Wynaad. None of these four races will touch carrion nor fresh beef. The Kurumbar, the Punnear and Nayakar will however eat bison flesh, as in their opinion bison are not cattle. There are four more tribes in South-East Wynaad who have migrated from their native country; these are, first, the Badagas from Nilgiris: they are chiefly rice cultivators and own large herds of cattle; they have taken up the habits, etc., of the Malabaree; they hold the same Vishoo and Onam feasts, and they also have their Gowree and Passarah feasts. Some of the poorer men go to the coffee plantations for work; they eat flesh, but not beef. Then comes the "Jaderchetty" (weaver caste) migrated in years gone by from their native country, Salem. These also cultivate rice fields in a small way. They have their own village, a few coffee trees around their houses, and also possess a few cattle. They have no weaving industry, and those in poor circumstances go on the coffee plantations for work. There are also a few families of Todas who have migrated from Ootacamund. They possess large herds of buffaloes, and sell ghee in large quantities, with which money they buy food. They never work as coolies, nor do they cultivate. The next race settled in South-East Wynaad and near Goodalur are the Koturs. Some twenty or thirty families migrated years and years ago from Kotagiri. They are a very filthy race of people; they will eat carrion. The men mostly do blacksmith's work, such as billhooks, axes, grass knives, and hoes for the ryot. Some of them possess cattle (buffaloes) and they also cultivate coffee like the Chetty. The women are clever potters in their own way. They make and supply a large quantity of earthenware to all the other natives in South-East Wynaad. The men and women wear one single cloth like the Todas. If any death happens among Todas in the Nilgiris, these Koturs go up for the funeral ceremony with their drums and long trumpets, and of course have a good feed of the flesh of the buffaloes sacrificed by the Todas. During the early days of the Ouchterlony Valley, and in the time of crop and scarcity of labour, we used to employ the Kotur gang (young men, women, and boys) to pick coffee, at which work they were pretty smart and earned money. Mostly all the men are good looking, the women very pretty mostly, but they are a dirty lot. The men are very useful now to the native merchants about Goodalur, as they are clever in building katcha houses and sheds. South-East Wynaad at the present time is thickly populated with all castes and creeds of people. It is to be hoped that in a few years it will turn out a big tea planting district, as there are thousands of acres of good land to be got. And it is a known fact, that tea in Wynaad will grow luxuriantly; witness "New Hope," the extensive tea garden in the Ouchterlony Valley. There is also an estate at Pundalur opened by Mr. Punnett; there is one on the Glenrock Valley opened by Mr. Minchin in the year 1886-87, and the one opened by Mr. W. Ryan at Dewalla, and also there is one now being opened out on a large scale, the Chambally estate, near Goodalur, by a planter from Ceylon. Before the demarcation of land by Government, there used to be serious rows and fights between planters about their respective boundaries. Things were very wild and lawless in the old days, and coolies used to be drilled into shape in ways unknown to the modern generation. This is now all changed.

The old coffee carriers: Brinjari.

I shall now write something about the manner coffee crop was transported to the coast for curing and shipment. We had no road for carts, but only old Tippoo Sahib's steep road. We had to get the Brinjari to take it down on their pack bullocks either direct to Calicut, or about half way to the backwater, a place called Mombat, and another Areacode, and from there sent down in boats to the coast; it used to cost from four to five annas per bushel of parchment. The crop from Cherrumbatty District was sent direct to the coast via Sultan's Battery and Tambracherry. Since cart roads have been made by Government, the planter has no difficulty now in obtaining carts, which take the crop direct to the coast. In olden days, when crop was taken down on pack bullocks by Brinjari, they had great difficulty on the steep parts of the old ghaut; sometimes a restive bullock would bolt down and tumble down a precipice, coffee and all. The poor Brinjari and his wife had very tiresome work until they got to the foot of the ghaut. He always carries his breakfast in his large cowry bag hung round his

shoulder, and also his rude kind of hookah, with tobacco and bhang, and the chakmik flint, steel and cotton. The men wear tight drawers, with a tail behind in which hang cowries prettily stitched by their women. The women wear thick red petticoats and jackets and nicely adorned with cowries. The front of the hair is nicely plaited and cowries attached to it; the back hair is made into one big knot. The Brinjari woman always covers one half of her head at the back, the jacket covers the whole figure from neck to waist; the head, a mixture of red and white, with red tassels mixed with the favourite cowries, and also beads made of porcelain or lead. Some of the men generally wear a silver armlet, and the women brass anklets. The late Alfred Wright prepared and shipped several seasons' crop from the Ouchterlony Valley, and in the year 1855 he obtained a plot of land for Mr. Ouchterlony in Beypoor, and on which now stands the coffee works of the valley. The other estates crops, from the valley, Goodalur, Dewalla, Pundalur, and Cherrambaddee were sent down to the works of Messrs. Parry & Co., Arbuthnot & Co., Pierce Leslie & Co., and Andrews & Co., and also to Messrs. A. Maylor & Co.'s works for preparation

Famine.

during my long residence in Wynaad, I have seen two famines, namely one in the year 1866-67 and the other in 1877-78; the former was not so severe, but the one of 1877-78 was a very bad one indeed, and I found many a poor cooly dying or dead on the road. It was somewhat of a help to the Kurumbar, Punnears and Nayakars that a large area of bamboo seeded in the Nellakota District, and these poor people used to live under the bamboo clusters, collect the seed and eat it. Bamboo seed is rather unwholesome food, as it brings on dysentery. I have seen poor Canarese and Tamil coolies, their women and starved children actually wrench off the bitter wild brinjalls and eat them. Many planters with help from Government had relief works, and food houses made, and so saved many from untimely death. The famine extended to Mysore Province, from which source grain used to be brought to Wynaad, and it was with great difficulty merchants of Goodalur and Dewalla could get the grain merchants to sell. Famine-stricken highway robbers infested the roads between Goodalur and Angalun (the village this side of Goondelpett), in fact it was a severe famine for nearly two years. Several branch roads were opened out by Government as relief works.

The landlords.

There are three principal landholders in the district. One, the largest landholder, and very wealthy he is, is the Nilambur Trimulpand Rajah. He owns thousands of acres in the district,—namely, the Ouchterlony Valley, Goodalur, Teppacandoo, the Naduvattam Ghaut Valley, the Moyar Valley, the Dewalla, the Nardghanie Valley and a good deal in Nellakota District and Moodumullay. He has several thousands of acres of dry land leased to planters, and the wet land to ryots. His revenue yearly from the Wynaad is large; he has agents employed to collect the rents, and carry out all his affairs. He has also a big kovil beyond Goodalur, in which a Brahmin resides permanently, poojay done, and food cooked and given to the Brahmins and Nairs who may go there. The next big landowner in South-East Wynaad is the Wandur Namboodripad; this gentleman resides in Wandur, and employs an agent in Wynaad to collect rents from the planters and ryots, to whom land is leased out in the Nellakota and Nellyalom district; he has also a large kovil, called the "Punnanee Ambollom," in which also a Brahmin resides permanently. The Namboodripad may visit this Ambollom once in a year. The third landowner, Jenmee, is the Nellyalom Arasugal; this rajah is of the Lingayat caste from Mysore Province. At present he holds over twelve thousand acres or so, and a large area leased out to planters and ryots. The Jenmabogum rent charged by these Zemindars is from one to two rupees per acre for forest and scrub and eight annas per acre for grass land and for the paddy flats. The lessee has to pay besides this the assessment to Government. Some thirty years ago, the Chetty (ryots) made themselves out as land proprietors, and leased out land to planters, but this was put a stop to by Government in the year 1864. All such lands and also several blocks of land which were formerly held by the two Zemindars herein mentioned, namely, the Wandur Namboodripad and Nellyam Arasu, have been escheated to Government, as no satisfactory title could be produced by them before the Revenue Settlement Officer, when the revenue settlement took place twelve years ago.

It is so well-known now that Messrs. PHELPS & CO.'s prices, notwithstanding that they are considered high, are so much below those of London, that their trade is advancing by leaps and bounds.

Rhea and other fibres. In the year 1885-86, Mr. J. W. Minchin, the general manager then for the Glenrock Gold Mining Company, opened out extensively the rhea plantation in the Glenrock Valley, and got the Fibre Machinery, etc., from England. In a couple of years the rhea plant grew rapidly, and the first crop of stems were cut and put through the machine, etc., but in the third year, caterpillars of a dark color, in length fully four inches, came into the rhea field in such enormous numbers, that it was quite impossible to check them. Although Mr. Minchin tried every possible means he could, it was of no avail, and the rhea plantations were destroyed. Mr. Minchin also got several other fibres done on the works by the same machine, namely, the wild Rhea, the Plantain, the Nettle, the Ureana and the Furcroya Gigantea. The first were found wild in Glenrock Valley, but could not be got in large enough quantity to make it pay. The Nettle and Ureana fibre were very good indeed, the wild Plantain and wild Rhea not very strong. The Furcroya Gigantea grown in the Glenrock Valley grew vigorously and gave leaves of great length, but the fibre very rough, though very strong. This plant will grow without any trouble or expense after it is once put into the ground. No caterpillars could eat it. No cattle could go near it on account of its sharp thorns. Mr. Minchin has also grown and tried the green aloes (very common in India), but none of all these indigenous fibres could equal rhea. Mr. Minchin also tried the Morva through the fibre machine, which answered well; but this kind of plant is only found on the slopes of Nilgiris towards Coimbatore and the Anamalais, I am told. I have however seen it growing at the foot of Coonoor ghaut. There is the wild Pepper, Cardamom, Ginger, Saffron, the Betel (Pansuparee) Creeper, the Areca Nut, Nux Vomica, Galnut, and several other varieties, and there is also the Rattan Creeper, which grows to an enormous length, and from three inches in thickness down to a fourth or even one-eighth of an inch.

Natural History.

The valuable timber growing in the forests are: The White and Red Cedar, Jack, Black wood (Rose wood), the Hyenee, Benteak, Vengay (Gunkin), the Iron-wood and the Poon, and at the foot of Glenrock Valley there is Ebony, Poon, Benteak, and Vengay are generally used for buildings. Iron-wood keeps very long under ground, and the white ant (very destructive in Wynaad) cannot eat it at all. There are also lofty growing Dammer trees in the forest. The Nayakars collect this gum by marking the stems with an axe, they also collect the cardamom, ginger, saffron, etc., and sell it to the petty Moplah merchants. First, there are several kinds of snakes, namely, the Rock snake, Yemmay Murdall (python), which I have seen of enormous length, varying from six feet up to twenty feet, and from four inches up to twelve inches in thickness. My brother Alexander shot one of enormous length and thickness. Then there is the Cobra, length from two and half feet up to over nine (! Ed.) feet. Then there is the Carpet snake called Mundell by the aborigines, the length which is from two to three feet; the head is big, large mouth, and the fangs projecting; the centre of its body is the thickest, and abruptly tapering off to the tail, which is much like the tail of a rat. The bite of this snake is most venomous, and if not immediately attended to, the patient spits blood, gets unconscious, and dies in a few hours. There are other species of snake in Wynaad, the Green snake and other varieties which are not venomous. The Green snake grows to a length of six or seven feet, a long sharp pointed mouth, opens wide, sharp gray eyes; it generally climbs up tall bushes in search of small birds or tree toads. I have watched this very often; the little birds get quite stupid and flutter about very close to the snake, and it immediately pounces on the bird which is swallowed whole by the snake. The Python or Rock snake generally lays himself near the borders of streams and swampy places, where the small species of deer may come to, which of course is caught and crushed and swallowed in the same manner as is done by the Boa constrictor. I have not known to my knowledge of men being killed by the Rock snake in Wynaad. Then there are huge blue scorpions in Wynaad; these are found generally in cool places and under rocks; the sting of this is not venomous. When opening out a road in Wynaad, one of my Kurumbars was stung; he felt no pain, but only a slight swelling on the stung part, and heavy perspiration, and after a good chew of pansuparee and a quid of tobacco, he felt all right. Then there is

the Centipede. It is of a dark red colour, and fully from six to twelve inches in length and thick in proportion. There is also the Tarantula, which is of a good size. I have not noticed any cases of men stung by these. I have seen good size Cameleon lizard, and also the inghuana, found very often in the border of rivers, and varying in length from two and half feet up to five feet from head to tip of tail. The real "jungle tribes" of the Wynaad are very much the same as those in other parts of the Western Ghats, and are too numerous to mention. Of fish one of the best (from the eating point of view) is the eel, which grows up to two and three feet. Elephant, bison, tigers, panthers, bears etc., etc., are very abundant. Elephants are most plentiful down near Nilambur. Tigers are generally killed by being netted and speared, which work is mostly done by the Kurumbars and Punnears. In the old days Government used to give rewards of thirty rupees a head for shooting elephants, and many a splendid tusker have I brought down in company with my brother. Now of course there is no elephant shooting allowed at all. But what grand times we used to have in days of auld lang syne! And dangerous times some of them were. A Mr. Hinton once was caught by the tail of his coat by a charging elephant and only escaped by falling into a pit. Another man got smashed up entirely in the Teriot, and another, a Lieut. Wedderburn, got served up in a similar was in the Teppecadoo. One day in the Ouchterlony Valley forests, and up the Sentinel Rock Valley, where the "Hope" Estate now stands, my brother and I shot down three elephants in a herd, one tusker and two cows. One of the cows had a very young calf, but as soon as ever the mother was down, another cow elephant carried away the young calf. It was on this memorable day that I got the shikari to milk the dead cow elephant and tasted the milk which, though a little sweetish, is strong and sticky. The Hope Estate therefore goes by the name of "Ammaykauddoo" by the natives up to this time. It takes several weeks for the carcass of an elephant to rot and decay, in fact three months. All kinds of beasts such as the jackal, cheetahs and vulture feast for days and days on the carcass.

In the year 1873, when I was over at Nellakota on a visit to Mr. Caleb Vigor, the owner then of the famous Sussex Estate, I met a Mr. George Withers, a Gold Miner out from Australia, at Mr. Vigor's.

Gold Mining.

During the course of our conversation, the Gold mining came out. Mr. Vigor (who also was formerly a Gold Miner in Australia) told Withers this: "Why man, come over to the Dewalla side and I will show you auriferous quartz reefs." Mr. R. V. Capps, who is now one of the settlers in Kolar Whitefield, also accompanied Messrs. Vigor and Withers the next morning, and went over to the foot of Strathearn estate (since known as the Dewalla Mayar and found certain auriferous reefs, with the quartz showing gold visible to the naked eye. These gentlemen were satisfied and returned to Mr. Vigor's estate. After this I invited Mr. Withers to the "Perseverance Estate," my residence in Dewalla, and took him over to see the extensive number of shafts by the sides of the well known "Shoobemallay" mountain. These shafts were made by the ancient miners called "Vadars" (this race of people are quite extinct now). The shafts are sometimes of a depth of a little over one hundred feet. The mouth of the shafts were round and about four to six feet in diameter, and situated very close to each other with connection or drives from one to another. Mr. Withers got several of these shafts cleaned out, and found the reefs on which the ancient worked. He brought up some splendid-looking quartz showing visible gold. Mr. Withers remained in my bungalow and got on with the prospecting for several weeks. All this happened about the end of the year 1873. About the beginning of 1874 there was a rumour that some of my Kurumbars (who were working for me for several years on the Perseverance Estate) had come across a rich quartz reef in the direction of Nardghannu (since called the Alpha), and that they were getting a quantity of gold. Myself and Mr. Withers visited the spot at once and found it to be a fact. We got a shaft sunk, and before getting to a depth of twenty feet, the reef was found running south to north, and dipping east. The quartz out of the third level or section of the reef was very rich. Myself and Mr. Withers informed this at once to our friends Messrs. J. W. Minchin, Vigor, Capps, Edward Atkins, Fletcher and J. W. Ryan. We formed a small company between ourselves. Some of us went down to Nilambur, saw the Raja Trimu

PHELPS & CO. have often been asked why they don't open a branch in Darjeeling, but for that matter they have been pressing for years past to open at Bangalore, Coonoor, Madras, Rangoon, Lucknow, Cawnpore, Delhi, Mussoorie, and even in Nainital, but they prefer doing business from their Head Establishment, where the Managing Proprietor can have everything under his personal supervision, and travellers are employed to visit everywhere.

SEEDS AND PLANTS

OF

COMMERCIAL PRODUCTS.

Tea, Assam Hybrid and Indigenous of high class jats, China Tea, Cacao, best Forastero Trinidad varieties, Sterculia Acuminata (Kola nut), true superior variety, Hevea Brasiliensis (Para Rubber), True Maragogipe, Liberian and Arabian Coffee, Nutmeg, Clove, Cinnamon, Cardamom, Vanilla Planifolia (true Mexican variety), Erythroxylon Coca (large and small leaved kinds), best Sumatra Tobacco, Boehmeria Nivia (Rhea), Mangosteen, Sapodilla, Giant Kew (fruit weigh from 10 to 28 lbs. and over) and twelve fruited Pine Apple, Erythrina Lithosperma, E. Umbrosa, Fourcroya Gigantia, Artocarpus Incisa (seedless Bread Fruit), Arnatto, Kapok, Coconut several varieties, Penang Areca nut (large), Landolphia Kirki (African Rubber), Teak and numerous other seeds and plants. Price on application.

Touching a shipment of Indigenous Tea seed, an experienced Indian Planter writes us from Madura District dating 24th June 1896: "Just received the Tea seed; it has arrived in perfect condition, notwithstanding unnecessary delay in transit, and does you credit. Please book me for five maunds as early next May as possible."

MARK TWAIN.

CALCUTTA, *February 8th, 1896.*

MESSRS. CHILD & CO.

SIRS,

This is the brand I wanted. I have smoked your Honey Dew Mixed in another part of the world, and learned to prefer it.

Truly yours,
S. L. CLEMENS.

Child & Co's Honey Dew Mixture is prepared in Liverpool from the four finest growths in the world, viz.:—Sun-dried Virginia (sweet and mellow), Old Kentucky (full flavoured), Turkey Dubec (mild), Latakia (fragrant). All finely matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength, with delicious flavour.
The finest that can be made. No equal. In $\frac{1}{4}$ lb. air-tight tins ...Rs. 2-8 per lb.

CHILD & CO., *Tobacconists,*
CALCUTTA.

BANGALORE WOOLLEN, COTTON AND SILK MILLS COMPANY,

"LIMITED."

Good and cheap Cotton Banians, plain white or colored, all colors, suitable for maistries and laborers on Coffee, Tea and other Estates.

paud and got him to lease to us some two hundred acres at a very low rent yearly. We set to work, and prospected this reef, which we named "Wright's Level" and another very wide reef on the same run north, naming it "Skull" reef. (We called this the "Skull" because we found many bleached skeletons near.) This skull reef was not rich, but it always gave at the rate of *Three Dwt.* of gold per ton of quartz. When all arrangements were completed, we made it known to the public, and we formed it into a Gold Mining Co. (Limited) on a capital of one lakh of rupees in *one £* (or ten rupee) shares, which were all immediately taken up in India, the promoters having accepted one half of the capital in shares, so that only one half was reserved for working expenses. We named it the "Alpha Gold Mining Co., Limited." About the year 1875 we got out a small crushing mill of fifteen stamp head from Australia (Melbourne) and also a Mechanical Engineer to have the battery erected. At the beginning of this year our chief man, Mr. Withers, left the Alpha sick. We, the remaining pioneers, were left in a nice fix. And all we could do was to collect the quartz, whatever it was, from the surface and brought it down to the battery which was being erected. We knew nothing of quartz mining, and our partner, Mr. Caleb Vigor, only an Alluvial Miner in Australia, could not help us. However, with much trouble, etc., the battery was erected, and about the month of August 1875 (after the christening ceremony of the engine) the crushing began. Mr. Binny, the Mechanical Engineer, did as much as he knew in the shape of laying the sodium quicksilver, etc., on the plates and ripples, etc. After a fortnight's crushing we got him to clean up, and the result was not as good as we expected (our partner, the late Mr. Fletcher, also knew something about gold washing, but he too was an Alluvial Miner in Australia in the early days there). At this poor show of gold we were much disappointed. About that time a Mr. Rosscrow came up from Bangalore and said that he was an experienced miner and so on, but he knew nothing and made matters worse. Another man, named Harris, advertised in the Bombay papers that he was an experienced gold miner and amalgamator and so on. We got out this individual from Bombay, but in a short time, to our disgust, he made matters still worse. We, the pioneers, made a great mistake in forming such a small Company, and with only 50,000 rupees left as working capital, the funds came to an end, and the works had to be closed. I must say that at the beginning of our prospecting the quartz, the country was visited by the geologist Mr. King, whose remarks were very favourable indeed, but the mistake was the small capital. However, as I said, all works were stopped on the "Alpha" for nearly two years. In the meanwhile Mr. Minchin formed another small Company between himself and some of his planter friends, calling it the "Wynaad Gold Prospecting Company." Mr. Minchin got machinery set up on a small scale on the Nardaghannie, or eastern side of the Alpha, as next door neighbour. He got up a set of pneumatic stamps and worked it for some time (this property was subsequently transferred to the Glasgow Indian Mines Co.). Mr. Minchin took great interest in the establishment of the gold industry. He got up old records from the Government Office in Malabar, in which there was a long history of gold industry in Wynaad. The Government employed a certain Lieut. Nicholson with a party of Sappers and Miners to work the "Shoolleemullay" mines left by the ancient miners, the "Vadars." As I stated, the works of the Alpha were at a standstill for nearly two years. But in the year 1877, our mining friend Withers returned after having been tired out in the plains where he went to. We at once formed a small Company between ourselves, namely, myself, Messrs. Vigor, Edward Atkins, Williams, J. W. Ryan and Withers, and we named our Company as the "Tribute Company." We appointed our partner, Mr. Williams, as the Honorary Secretary, and Mr. Withers as our Mines Manager (Mr. Minchin still going on with his Prospecting Company, and also giving us every help). We applied to Messrs. Parry & Co. to let us the Alpha or Tribute for one year, binding ourselves to pay twelve per cent. on the gold realized from the mines. Myself, Messrs. Vigor and J. W. Ryan were appointed as the Directors. We set to work at once, got out two Engine Drivers from Ootacamund, one named Wilson and the other Mr. William Barnard (at present Proprietor of the Transit and Livery Stables in Ootacamund). Mr. Withers set to work hard at real mining, and got out rich payable quartz from the "Wright's Level." Our blasting process was done with blasting powder and fuse, as no dynamite

was in existence in those days. Splendid show of gold in quartz taken out from the third layer of the reef at about fifty feet in depth from surface. We had to put the battery and boiler in order; we had to buy quicksilver and sodium and some other chemicals at a high price, and we had to do many things to get into working order. Our first crushing was small and only for one month, and we got enough of free gold to pay the working, etc., expense. But the second crushing of three months was very good indeed; the rumour flew abroad wonderfully quick. Sir Andrew Clarke with his staff visited the mines and mills and was highly pleased with what he had seen. A grand breakfast was given (with the kindly help of Mr. Minchin and mostly at his expense) in the Mill House shed, and there were many visitors that day, in fact, visitors almost daily, and the Directors supplied freely all that was required in the way of refreshments. The late Mr. Ferguson, proprietor of the Ceylon paper, with his two sons also visited the "Alpha." The good old gentleman bought some of the gold, and also some rich specimens of quartz, which he took away with him. When we cleaned up our second crushing, it was grand. We expended about a thousand rupees as working expenses during the three months, and we obtained over Three Thousand Rupees worth of free gold. After all this show of gold to the public, we "Tributers" stopped. This ended in the year 1878, and for one year again the Alpha mines lay idle. The Governor at that time, the Duke of Buckingham and Chandos, visited the Alpha while the Minister of Mines, the late Mr. Brough Smythe and his able miner from Australia were inspecting and reporting about the auriferous reefs in the district. We had a grand breakfast at the Provident Estate Stores, and there were many planters who came over and enjoyed themselves. Mr. Brough Smythe's report on the various quartz reefs in the country was not only elaborate but very interesting. In the year 1877 the gold fever came on strongly. Mr. Charles Royal Dawson bought up a lot of our Alpha gold at the rate of Rupees Fifty per ounce, and also with rich specimens of quartz and with copy of Mr. Brough Smythe's report started off to London, and he formed the first Company there on a large capital of one hundred thousand shares of £1 each, naming it "The South-East Wynaad Gold Mining Co., Ltd." He transferred the Richmond, the Needle Rock, and the Bolingbroke estates, a vast extensive property, receiving for himself one half of the capital in shares and money, leaving the other half for working expenses. He brought out a mining engineer, a mining captain, three Cornish miners one carpenter and one European blacksmith, all on high salaries, and with an agreement to serve the Company for two years, and he himself as manager also on high salary. The Glasgow Bank also formed a Company, and bought up Mr. Minchin's Prospecting Co. works and lands, and eventually took up the Alpha also on case. The Company was named "The Indian Gold Mines Co., Ltd.," then several companies formed sharp one after another, namely, The Perseverance, The Devalla Central, The Indian Consolidated, The Devalla Moyar, The Trevelyan, the Dingleydel, The Glenrock and the Cherrambaddee and the Provident Company. All these Companies got out expensive staffs from London on high salaries. They bought up lands from planters at a very high figure, which swallowed up one half of the capital. With the other half they set to work and made the saddest mistake by getting up all kinds of machinery in the first instance. Erecting expensive buildings and neglecting the first work of prospecting the reef and the mining, they kept scratching the surface and digging about all over the country, and their only ambition was to erect the mills and to crush the quartz which, being got mostly from the surface, gave poor results. This way of working could not continue very long; all their capital came to an end, and all works had to be closed, leaving the Devalla, the Pundalur, and Cherrembaddee districts a desolate wreck. The once beautiful coffee estates which these companies had bought up for gold mining, are all now a desolate ruin. The enterprising people in England, seeing Mr. Brough Smythe's report, bought up shares at once: and this seemed to them that simply the quartz had to go through the mill and tons of gold got, but they were mistaken. Mr. Brough Smythe's report was very favourable of course, but in it he never advised that the mining industry should be done in this extravagant foolish manner, and the capital expended in so short a time. At any rate, the original owners of lands in Devalla,

It has been remarked several times that no doubt PHELPS & CO. will raise their prices, now that they have taken their Ladies' Department to 4, Russell Street, but it is a mistake.

Pundalur, and Cherrembaddee districts did a very profitable business, as they got a high figure from the Company, who were so eager and hasty to get the lands at any price. The Nilambur Rajah made a great deal in rents. As in the years 1874 to 1880, his charge was at the first fifty rupees per acre for mining, but from the year 1880 it went up to as high as two thousand rupees per acre for mining land. Such is the brief history of the gold enterprise of South-East Wynaad. It began gloriously, and within ten years ended disastrously. Many a poor shareholder in London lost his hard-earned money, and this auriferous part of the Wynaad is condemned as having no payable reefs. The aborigines (Kurumbars) who took so much trouble in pointing out the reefs in forests were quite ignored by the Mining Managers. These Kurumbars would have made excellent miners, with only one Cornish Timber Man in each Company to supervise the mining and timbering of shafts and tunnels, and I shall end at last by emphatically saying that we the pioneers of the gold industry have been cruelly disappointed. We laid out thousands of rupees of our own money at the beginning with the hopes that South-East Wynaad would be a flourishing gold mining district, but our hopes were blasted, and the defunct Companies could never again be resuscitated. The country is now deserted. The defunct Companies, most of them, have relinquished their lands to the Zemindars, Jenmees. The Glenrock Company are still holding out, not in any way mining, but retaining their lands. And I say that if this Company does make another attempt in mining, and carry on the same economically, they will yet do well in course of time. But they seem to be quiet, although it is now over six years that they have stopped all works. The auriferous quartz in this country is intermixed very much with pyrites, which contains most of the gold, and as at the present time there is a way of extracting the gold from this metal, I am of opinion that another attempt made in mining will turn out profitable.

If commonsense precautions are taken in building the bungalow on breezy hill tops, very little danger is there of catching "Wynaad Fever," especially if the means allow of planters being able to visit Ootacamund in the hot months of March, April and May, the idle season on estates. Of course some estates are all flat, and in these cases the manager has to take his chance. Before vaccination was practised the ryots used to suffer dreadfully from small-pox, but now the attacks are a great deal milder. There is very little cholera, and still less typhoid or enteric fever.

(To be concluded in our next.)

A WORD OF FAREWELL.

WE make no excuse whatever for reproducing in full the valedictory article of the *Madras Mail* on the departure of its Assistant Editor, Mr. Stopford, for Northern India. It is with very real regret that we ourselves bid him farewell, for a truer and abler friend to the Planting Industry of South India it would not be possible to find. It is difficult to exaggerate the benefits he has conferred on the planting community, a community of which he was once an able and popular member. We trust, however, that the traditions he has left in the *Mail* office will be powerful enough to support that journal in its able and unswerving championship of our interests.

Good luck go with you, "Francis . Ford," and may your rewards be as great as your deserts!

While partings are common enough in India in official circles it is but rarely that the Staff of a newspaper permanently loses one of its number; yet at this Christmas season we are undergoing the deprivation of the professional assistance and the society of a member of our Staff, in the departure to a new sphere of journalistic

work in Northern India of Mr. Francis Powys Stopford, who for upwards of three years has filled the office of Assistant Editor of the *Madras Mail*, and has on more than one occasion occupied for varying periods the editorial chair. We take the opportunity of publicly bidding him farewell, for a particular section of the community, ever increasing in importance, viz., the Planters of Southern India, have expressed a wish to place on record their hearty appreciation of the manner in which Mr. Stopford has, as a journalist, brought their needs and their deserts prominently to notice. The planting industry is of enormous importance to the country, but there is no disguising the fact that it is only of recent years, and then chiefly through the strenuous exertions of the Press, that this fact has come to be generally recognised in a practical manner, greatly to the advantage of the planting community. There still remains much to be done if planters are to be placed on an equal footing as regards law and justice with the members of communities more in touch with and more under the immediate eye of the Government and its officers. It was some six years ago that Mr. Stopford, who had come out to India as a coffee planter, forsook planting for journalism and joined the Staff of the *Madras Times*, then under the editorship of Mr. Harry Ormerod, who has recently been appointed Secretary to the United Planters' Association of Southern India. With a ripe experience of planting matters Mr. Stopford soon began to show in print under what disabilities the community laboured, and when he subsequently came to us we welcomed the addition to our Staff of a writer who had acquired a deal of wisdom born of experience. Planting matters have always received a fair share of attention in our columns and many valuable discussions have taken place therein amongst planters themselves. The efforts of Mr. Stopford since he joined the Press in a professional capacity have no doubt acted as a powerful lever, and planters have little reason now to complain of non-recognition or disregard of their interests. One of the leading planters writes in the following appreciative strain of the efforts on their behalf of Madras journalism in general and of Mr. Stopford in particular. Mr. Stopford is transferring his services to the *Civil and Military Gazette*, and in bidding him farewell we cordially echo the expressions of good will uttered by "A Planter" in the following note:—

"I am sure if it were generally known in planting circles that Mr. Stopford is vacating his appointment on the Staff of *Madras Mail* and is leaving the Presidency, it would be a general wish that he should not do so without some recognition of the good work he has done for the planting community in giving so much attention to planting affairs in the columns of the *Madras Mail*. Great changes have taken place during the past few years in all affairs concerning the Planting Industry. Its importance has been recognised first by the Government of Madras—and through them by the Government of India. Grievances from which Planters have suffered for years have at last been thoroughly ventilated, and they have a representative on the Legislative Council through whom they have ready access to the ear of Government. There is firmly established a United Planters' Association of Southern India notwithstanding that only a very few years ago it was thought impossible to hope for such unity of action. In every way planting affairs are in a sounder and more satisfactory state than they were and good work is being done in every direction by District Associations as well as by the U. P. A. No small portion of the success that has attended all these steps towards improvement is due to the interest your journal has evinced in all planting matters—in emphasising the necessity for legislative reforms—and the importance of the industry, in urging the establishment of a central association and in giving space for correspondence on all points. Friendly criticism, all the more valuable because it has been fair and unprejudiced, has also acted as a guide, and stimulant, to the leading members of the Planting Community who have been entrusted by the Planters of the various Districts with the management of their affairs. Without in any way wishing to imply that Mr. Stopford is the only member of the staff who takes an active interest in planting matters, we cannot but feel that in him we are losing a good and true friend, and in bidding him farewell and wishing him good luck in the new sphere of work to which he is passing, no better medium of doing so can be chosen than the columns of the journal where his name and his writings are so well-known."

Ladies in the mofussil do not always realize that they can by corresponding with PHELPS & CO. at their Ladies Branch at Russell Street, keep in touch with all that is newest and most fashionable in the world.

THE LONDON MARKET.

WE are indebted to the *Produce World* for the following Price Current, published in their issue of 4th December 1896. Our readers will doubtless be able to obtain a great deal of interesting and valuable knowledge therefrom. Myrabolams for instance are selling at from £3-6 to £4-6 per cwt., while the local Nilgiri price is barely Rs. 3-8 per bushel, or (say) Rs. 15 per cwt.

We intend to publish these Prices Current regularly every few months.

LETTERS TO THE EDITOR.

GUM-KINO.

SIR,—I should feel obliged if you or any of your readers could give me some information about gum-kino, for instance the best way of removing impurities, best way of packing it, and who are the best people to send it to. STICKY.

POLLEN.

SIR,—Can the pollen of a flower be carried any distance, without detriment to its properties? For instance, would it be possible to hybridize at Ootacamund with pollen obtained from Burma? If not, why not? On the contrary, how should the pollen be transferred from the one place to the other?

Yours faithfully,
D.

BANDICOOTS.

SIR,—Will any of your numerous readers let me know of a way to exterminate bandicoots? My bungalow is infested by them, and although I have used various descriptions of traps, have entirely failed to catch any.

KADUR DISTRICT, 24th December 1896.

"H."

"IMP DUNGING."

DEAR SIR,—Your P.D. has spelt the above in the last para. of my article on the "Brief Review of the Nitrogen Question" "Quilp dunging." "Imp dunging" (Impf dünger für leguminosæ. See P. O., No. 29, page 17) is the new and scientific system "made in Germany" of manuring with Bacteria.

Yours faithfully,
"BET."

18th December 1896.

TO WINTER ORANGES.

SIR,—In last number of *Planting Opinion* you ask if I have ever tried wintering, &c., my orange trees; I have only manured them. If any of your correspondents can give me any advice how I should treat them so as to try and get them to ripen their fruit about this time or any time before the monsoon, I shall be much obliged.

KULSAPORE ESTATE, KOPPA, }
MYSORE, December 14th, 1896. }

Yours faithfully,
G. LESLIE.

VISITING AGENT.

SIR,—Will you or some of your able readers define the above two words "Visiting Agent." I do not mean the man who looks after a neighbour's property while he runs home for a month or two, but the individual who "roams" from one end of the Hills to the other including other districts, and pays a visit of some two or three hours to each estate drawing from Rs. 25 upwards for each visit and writing a lengthy (?) report, worries the manager with 1,000 and 1 orders which he knows can never be carried out, and then proceeds to the next tote; I define him as a "nuisance" and not worth his salt. ANON.

A CURE FOR BLACK BUG.

DEAR SIR,—Having seen in your paper of 9th May a very interesting letter from Mr. Newport on "Lady-birds and Bugs," in which he gives Professor Koebele's remedy for Black Bug, I was induced to try the mixture (carbonate of soda and resin) on some plants which were very bad with this blight; after three applications the bug has almost entirely disappeared, and

as the cost is very trifling. I should think that many of your readers may be induced to try this very simple, and in my case effective, remedy.

Yours faithfully,

A. W. BRODIE.

[The remedy alluded to is as follows:—Boil in two pints of water 3 lbs. washing soda (carbonate of soda) and four lbs. resin until well dissolved, then slowly add hot water while boiling to make 5 gallons of the compound. Dilute with cold water before cooling to make 40 gallons of the wash for the mealy bugs or 60 gallons for plant lice.—Ed.]

SAMBUR vs E. LITHOSPERMA.

DEAR SIR,—I see your correspondent "Coffee Planter" in last P. O. states that sambur have been eating his E. L. plants.

USE JADOO FIBRE

for Coffee, Tea, Cinchona, Tobacco, Oranges, Indigo and Sugar Cane.

Vide Leading Article in Madras Mail
of 9th September 1896.

JADOO FIBRE is not a Chemical Manure.

It encourages fibrous roots but never
exhausts the plant.

For full particulars apply to

PARRY & CO., MADRAS,

Agents for Jadoo Limited, Exeter.

J. HENRY & CO.

The Public are realizing that the above

firm are the Taxidermists in India.

“PLANTING OPINION,” COONOGOR.

Whether they will go in for it regularly is another thing on which I am unable to express an opinion, as they do not eat E. L. in this district; but I know what they eat in one district they leave alone in others. Perhaps the sambur will get ill if they eat too much of it. Mr. Hooper is my authority for the statement I made that it contains a poisonous alkaloid "Erythrine," the shoots therefore being unfit for fodder, so I think there is still hope that on a large scale it may disagree with sambur. I know a case of E. L. being eaten by something, for a time, believed to be jungle sheep, and afterwards left alone; I cannot say for certain whether the sheep were affected by "Erythrine," but in any case the trees have been left alone since, which rather looks as if they made themselves ill.

Yours faithfully,

ARIENKOW, SHENCOTTAH, 30th Dec., 1896.

B. NELSON.

ALL ERYTHRINAS ARE NOT E. LITHOSPERMAS.

SIR,—An old planter like "Jno. D. M." must have seen any number of "Erythrinae" growing all over the country, and if he had benefited by his long experience ought to know it is put down by natives on the slightest provocation as shade, as a curse for the beetle-vine, jasmine, etc., as posts for fencing and "Chupras."

It is satisfactorily proved that E. Lithosperma is a new variety, and if "Jno. D. M." would get the seed of the varieties growing in Mysore and compare them with that of E. Lithosperma and verifying his statements before jumping to conclusions and into print, it will, to say the least, save us from confusion. It's pretty rough on "Rêve d'Or," who has introduced a new tree and brought it prominently to notice, to be told that every cooly that sticks down what his ancestors from time immemorial have stuck down for shade had not heard of him.

G. R. O'BUSTER.

[Your remarks on "D. M." 's statement regarding the age of Grevelias were anticipated two numbers ago by the writer himself.—ED.]

TEOSINT AS FODDER FOR SILOS.

SIR,—My experiment was on three acres of land, two silos were filled $30' \times 6' \times 6' \times 2' = 2,160$ cubic feet, at 35 lbs. the c. foot = 34 tons of compressed food. The cost was about Rs. 108 or about Rs. 3 a ton as follows:—

Trenching one foot deep three feet apart	Rs.	36	0	0
Manuring in trenches 18 tons at Rs. 2 per ton		36	0	0
Cutting crops and chopping into four inch pieces		20	0	0
Weeding 3 acres	...	15	0	0
Sowing	...	1	0	0

Total Rs. 108 0 0

The allowance of food per head is 25 pounds: thus an acre produces eleven tons = 985 head of cattle or 80 head for one month or six head of cattle for one year. The Australian computation is eight head for one year per acre. My soil was indifferent Badaga land never manured before; on some parts where the soil was good, the stalks were 8 feet high, on poor land but four feet. The seeds were sown early in April, reaped in November; the plant tillers if cut over young, but not after flowering. The time to cut the crop is when it flowers. Bill-hooks are used for chopping the stems, and elevation of my land 5,400, perhaps 4,000 would be better.

Seeds sown in the trenches three inches apart.

AGRICOLA.

THE IMPORT DUTY ON ARTIFICIAL FERTILISERS.

SIR,—With reference to a representation that it would be well to admit artificial fertilisers into this country free of import duty, I have been requested to submit to Government

statistics showing the approximate quantity of such fertilisers used in the course of the year.

The Honorary Secretaries of District Planting Associations are of opinion that it would take months to collect such figures from planters, even if it would be possible to do so at all. I am therefore applying also to importers for information on the subject.

As it is impossible for me to be sure of applying to every importer, I venture to ask if you will kindly publish this letter, as an appeal to Planters and Importers to furnish me, as promptly as possible, with the figures of their own purchases or imports.

Only totals have to be put before the Government, and I will undertake that all information supplied to me shall be regarded as strictly confidential and shall be used solely for the purpose of arriving at the required totals.

Thanking you in anticipation,

I am, dear Sir, Yours faithfully,

HARRY ORMEROD, *Secretary*.

UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA, }
MADRAS, 21st December 1896.

GREEN MANURE.

SIR,—Your "legume cult" has now a large following. Can you not persuade the men who have given "the thing" a trial to let us have the benefit of their experiences? "Flying Haystack" in a back number mentions having grown cow-pea and asked for information regarding its treatment. Presuming he obtained the desired information, what have been the results of his pea? While on the subject, is not growing legumes in this manner rather tempting insecticide? Is it not probable that in the above-mentioned case an army of caterpillars might have settled F. H.'s doubts in a manner peculiarly their own? Having done this, is it not also probable and natural that they should have turned their attention to the coffee and caused it to suffer? From the depths of your knowledge, Mr. Editor, can you not pass a weighty opinion as to the possibilities of such occurring being real or merely a chance in a hundred. Until one established a growth of leguminous "trees," I should imagine that legume as a shrub or creeper would be safer grown independently, and in a reserve of its own. But then growing one's manure is troublesome. Are not the tons and tons of green stuff which surround most estates in the form of jungly undergrowth all available as manure, and manure of a valuable quality? Year after year one sees a most luxuriant growth spring up at the burst of the S. W., and year after year one sees it greedily devoured by the wild fires of March and April. Would not this "stuff" cut green and applied to one's estate be of great benefit? With regard to the mode of application, I am told that the best way would be to thatch the land between the rows of coffee, and to fork in the thatch about the end of the N. E. Monsoon, when it will be partially if not wholly decomposed. A more sensible way, I should imagine, would be to dig the common or garden reno, fill them up to about seven-eighths with green growth, and then flush the pits with a small quantity of earth. In this way decomposition would be assisted, and beneficial properties contained in the green manure confined wholly to the good of the soil. In conclusion, when would it be most advisable to cut the green growth, during its succulent stage, or when it had attained a more hardy and woody age?

WYNAAD BEAN.

[We cannot quite follow all our correspondent's arguments, but cordially agree with the value placed on green jungle. Planters who swear by "bulky cattle," and spend many thousands of rupees every year in its purchase, might well turn their attention to the far cheaper form of green jungle bulk.—ED.]

COLD WEATHER PLANTING.

SIR,—I have read the criticisms on this method of planting with interest and have tried it myself.

I put out between the 15th and 22nd October 10,000 or 11,000 plants with big balls cut out of the nursery, and on the 18th December weeded the clearing. Nett result: 12 plants dicky or dying. Notwithstanding a favorable season, I think this is sufficient evidence as to efficacy of this method. Every plant put out has put on at least two pair of leaves, and some four, and those I have lifted for examination show that the roots have broken the ball and started in the pit. Further than this I cannot go at present, but it appears to me that if you can *establish* plants, however small, in October or November, there must be a big growth with the early rains, and you have practically saved a year by adopting this system.

I cannot agree with your correspondent regarding rooting. If you make up your mind to plant in this manner, you must put more money into nurseries, and plant 6" to 9" apart, and then there can be no doubt as to the plants to be taken. In N. India more space is allotted to nurseries than down here, and the same place is not kept going year after year, in fact it is recognised that a good nursery means a good clearing. Turned roots, &c., are easily seen and rejected.

"Seed at stake" is another method and generally successful. Put these seeds into each pit and "mulch" them. The failures can be recruited from the good lots.

I put out a few acres on "Bortkanee" estate in Assam, and many plants were over three feet high the following monsoon. It is rather a hazardous experiment, but if it turns out successfully, a great saving, as a season is gained and all nursery expenses avoided.

Your correspondent has hit a very right nail. Let subscribers send a few practical hints and personal experiences. Science will do us a lot of good, and help our industry, but why hug our own little fads to our own breasts? One more remark. Let the tea planters exchange samples daily, with brokers' report and prices when possible. Individual estates getting records are satisfactory to managers and proprietors, but I am sure that the Nilgiri Tea Industry would be advanced if instead of isolated estates obtaining high prices the all-round average was raised, and which can be done only by more interchange of samples and ideas between the responsible producers. P.

ORANGE GROWING AND GRAFTING.

SIR,—I was glad to see that my letter on the above subject in *Planting Opinion* of 21st ultimo elicited some information from General Leslie regarding his experience with European varieties. He is evidently badly placed so far as climate is concerned. Coorg has a heavy rainfall in the Western part of the Province, but it is very considerably less as you travel Eastwards. I am not sufficiently acquainted with the relative merits of the various localities where the orange is grown to say which is the best or from which comes the most abundant supply. I should say away from the heavy rainfall of the Ghats is probably the most favourable situation. The fruit I believe ripens about November, which is practically the dry season. As Mr. Leslie only speaks of imported kinds, I would conclude there are no naturalized or indigenous sorts in his neighbourhood, more especially as he does not propose trying grafting himself. Why not try some Coorgs.

There is no doubt the orange tree thrives and produces well in Coorg, as it doubtless does in many other places, so grafting may prove the means of introducing finer and more valuable varieties. It is at least well worth trying if it has not been already done. Mr. Cameron, of the Lal Bagh Gardens, Banga-

lore, who I am glad to see contributes valuable information regarding other products to *Planting Opinion*, may have something to say on the subject. And through the Resident of Mysore, who is also Chief Commissioner of Coorg, his services might be obtained for instituting experiments. A good graft for the superior varieties of lemon might also be found. The important results of grafting are nowhere better seen than in the fine mangoes which are now produced in such large quantities from graft trees in Bangalore, and in fact in nearly every part of the Mysore Province.

The bitter orange too grows freely in Coorg, and the people of India need not go so far afield as Seville for their marmalade. In this country we have both the fruit and the sugar wherewith to make it.

The Coorg men seem to find a ready market for their ordinary oranges. Waggon loads (many in bulk) are forwarded to Bangalore and other places within reach of the Southern Mahratta Railway. Quantities more carefully packed in baskets are sent to Hyderabad and Bombay, and I am told even to places beyond Bombay. What is wanted are facilities for rapid and cheap conveyance. The worst part of the journey is in carts from Coorg to the nearest Railway Station at Mysore or Packswan. A regular trade seems to have been established, and as in the mango season so in the damp season there are loads of dealers always ready to contract for the fruit on the trees and find a market for it.

STEAM.

THE VAGARIES OF THE POST OFFICE IN A PLANTING DISTRICT.

SIR,—May I, through your journal, give an instance of how Planters' letters are sometimes tampered with by the Post Office officials.

Some months ago I went away for a short holiday, and on my arriving at a town on the West Coast found it necessary to send some money back to the estate for weekly advances, for which purpose I procured two currency notes, wrapped them in a blank sheet of note paper, and registered the letter myself at the Post Office, the letter being duly addressed to my bungalow. On my arrival home after a couple of weeks, I was rather surprised to hear that no notes had been received in the letter, which from outside appearances seemed all right, but on being opened was found to contain the same sheet of note paper I had enclosed, but instead of encircling the notes, it was protecting a half sheet of *thick foolscap*—the same as we are familiar with as emanating from Government offices.

I immediately forwarded cover, papers, and full particulars of complaint to the Head Office, Madras, and was informed that full enquiries would be made. Some months passed before an Inspector, a former Sub-Postmaster, came to my bungalow to take down a report of the matter, and every assistance was given him to obtain particulars from the tappal cooly who brought the locked tappal bag, and from two or three witnesses who saw the bag and letter being opened.

Another two months went by, during which I was informed that enquiries were being made at the Post Office where I posted the letter, and only the other day (seven months after the abstraction took place) I was told that the result of the enquiries showed that no Post Office official was implicated in the "alleged abstraction."

I will not withhold the name of the Post Office [But we shall as we do not fancy that style of advertisement which arise from an action for libel.—Ed.], as it has already earned a name for itself in other respects, but now learn that amongst the merchants and shopkeepers there, it is freely said that the Sul Inspector, who was supposed to have investigated the case, was

known to have received a "douceur" from the Postmaster to quash the case.

Now I would ask you, if the Post Office is supposed to be responsible for the *contents* of a Registered letter, or, as in this case, merely for the delivery of what they may choose to call an intact letter.

MUDGERE, KADUR DISTRICT, }
30th December, 1896. }

"HOYATU."

[As far as we can understand the Post Office Rules, responsibility for any except insured articles is expressly denied by the authorities. For all that, "Hoyatu's" case is a peculiarly hard one, and we should advise him to bring a charge of bribery and corruption against the offending officials.—ED.]

SOME QUERIES AND NOTES.

DEAR SIR,—Now that, thanks to *Planting Opinion* and to Mr. Nelson, "leguminous" has become a household word amongst planters, and we are all looking for the nitrifying "poochie," may I be permitted, through the medium of your valuable journal, to put you or any of your correspondents a query. Are the nitrate nodules found on the roots of leguminous plants used up by them in maturing their own crop? Or to give an instance, to make my meaning clear; could a crop of cow-gram be taken off a clearing and still leave the nitrogen in the soil for the benefit of the coffee?

It sounds rather like eating your cake and having it; but if the nitrogen is used up *in toto* by the leguminous plants, where does rotation of crops come in? And how does taking a leguminous crop off your land enrich it? [The nitrogen contained in the roots of the cow-gram or other leguminous plant is the answer to the seeming puzzle. This matter is referred to elsewhere.—ED.]

I noticed some time ago a correspondent was much distressed about "Foxy Parchment." This takes me back to my first coffee planting days, now twenty years ago, when I had to cure my first crop with temporary pulping arrangements. I had covers made for my vats to lock for additional security, and I can well remember my disgust when I washed the parchment out of these vats for the first time after the usual 36 hours' fermentation: it turned out a sort of slate colour; however, the covers answered after I bored $1\frac{1}{2}$ inch auger holes in them to let out the air. I mention this as just possibly I may have hit the right nail on the head, and your correspondent may have covered his vats which would cause over-fermentation even in 24 hours and turn his parchment foxy.

May I presume to offer a suggestion for what it is worth. Would it not add to the practical use of your paper if you could publish a building article in each issue, with a plan of a small and inexpensive bungalow for instance, with rammed earth walls and shingle roof, giving the quantity and cost of materials and cost of erection based upon actual experience. I am sure contributions would be forthcoming if invited. Cattle sheds, cooly lines, stores and pulping houses, with pulping and curing arrangements, tea factories, &c., &c., could all be treated in their turn. Local knowledge would be disseminated and many a valuable hint picked up by intending builders. Now, Mr. Editor, I am afraid I have already trespassed on your valuable space.

Yours very truly,
BEN TEAK.

PALAMADOO ESTATE, MERCARA, }
N. COORG, 30th December, 1896. }

[Regarding your last suggestion, for which many thanks, we shall try and carry it out. Like many other valuable ideas, alas, it at present only demonstrates what invaluable help this paper might render its readers but for one thing. And "that one thing," as Mother Seigel says, is a very important thing. It is, that our readers should try and help themselves, by using their pens as well as their eyes.—ED.]

AN INTERESTING CONVICTION.

DEAR SIR,—I secured a conviction some time ago under the Travancore Regulation I. of 1040, which corresponds to the much discussed Act XIII. of the British Indian Government. As a conviction under this statute is so rare, the circumstances of the case will, I think, interest your readers.

A Kangany contracted to fell 100 acres for me, and received an advance of Rs. 300. The contract provided that he should bring up 60 able-bodied men and commence felling on the 31st October. He never turned up. On the 28th November I put the case before the Magistrate, and a warrant was issued for the man's arrest. He was caught and produced before the Magistrate, who wrote to me requiring my attendance at Court on the 15th December. After proving the contract deed, the Magistrate explained the law, which was that at the option of plaintiff the prisoner would be required to return the money or perform the work. I was asked which I preferred. This put me on the horns of a dilemma.

First horn.—If I ask for the money, and the man returns it to me, he is free, which is what I want to avoid.

Second horn.—I am running the man in because he failed to bring coolies before the 31st October, and seeing that the time is long past, I don't see how I can ask him to fulfil that portion of the contract.

I chose the second horn of the dilemma, and asked that the Court compel the man to perform the work. The Magistrate then explained that he had the power to grant an extended time, and accordingly he named 30 days, before the expiration of which the man was to bring up 60 able-bodied men. The Kangany's face brightened up; he would be free for 30 days, after which he could reside in British territory, and in perfect safety, as the offence was not extraditable.

But a happy thought struck me just in time, and I asked the Magistrate if there was to be no security given that the work would be done.

The law was looked up on the subject, and it was found that the plaintiff could demand security, and if the defendant could not produce it, the Magistrate could sentence him to three months' rigorous imprisonment. I accordingly formally demanded security, and the Magistrate named the sum of Rs. 300 to be produced within three days. As the Kangany expressed his inability to furnish security, he was sentenced to two months' rigorous imprisonment, and was removed to gaol forthwith.

This seems rather a roundabout way of getting the man punished, and, as far as I can see, he is not in prison for breach of contract at all, but because he cannot produce security for its due fulfilment! I subsequently enquired what would have happened if the security was produced, and was informed that the man would have been liberated with an order from the court to fulfil the contract within a fixed time. If he failed, the security would have been forfeited, and the man would have been imprisoned, not for breach of contract, but for contempt of court!

It must be remembered that this conviction was obtained under the Travancore, and not the British Indian, law.

Yours faithfully,
A. F. M.

COFFEE.

A likely story!

Some well-meaning individual has been pulling the editorial leg of an English contemporary, probably with a view to give home prices a fillip. He is said to be a South Indian Planter:—

I would draw your attention to the following:—Last season I sold my refuse and native coffee, that as you no doubt know means the coffee left on the trees that never ripens, and the coffee picked off the ground some 60 to 70 maunds (28lbs. maund). The price I received was 18 rupees per maund, equal to £80 per ton on the spot. I have absolutely no expenses. No carting—no curing—no freight and no commission of any kind for best ordinary Mysore Plantation. This price in London was unequalled. You must remember that in sending coffee to London, *somebody*—I do not know who it is—reduces the quantity *shipped*, and the quantity *sold* by about two lbs. per bag—this, I am told, is “draft,” or “allowance” in London. In India, it would be termed differently!

Coffee stenophylla.

There are now three specimens of this variety of coffee growing on the Nilgiris, one of which is at Burliar and the other two in private gardens. They are apparently the only specimens of this variety left in Southern India, and were kindly sent us by Mr. Cameron of the Bangalore Lal Bagh, as they were not found to thrive there at all. The U. P. A. would do well to obtain a consignment of the seed through the Kew Gardens. The following details regarding this variety of coffee is taken from the Kew Bulletin, p. 167, of 1893:—

The narrow-leaved “wild,” “bush,” or native coffee, is sometimes found wild on the hills, and is more often cultivated by the natives than the Liberian. It grows very freely, and appears to yield quite as much as the Liberian, but it is somewhat longer in coming into bearing. Both the natives and French traders at Freetown say that it has a superior flavour, and prefer it to the Liberian. In fact, latterly, a certain amount has been exported to a wholesale French dealer, who is said to sell it at 4 francs 50 centimes a lb. as “best mocho.” Considering that it is worth in Freetown about 6d. a lb., this should be a fairly profitable trade, and a trial shipment should be made by the English merchants to find out exactly what the market value in Liverpool would be. The plant appears to thrive best on the higher hills about Sierra Leone, on gneiss or granitic soil, and can be grown from 500 to 2,000 feet. Probably it may be grown both above and below these limits.

Tannery refuse.

In answer to a query regarding the action of this manure, Mr.

Winterbotham says:—

I find that it does not act as quickly as poonac, which is quickest but about as soon as cattle manure.

Probably the admixture of lime with the hair prevents decomposition for a time, which is perhaps as well. The action of groundnut poonac especially is almost explosive, in a warm climate, and one would think that some of the nitrogen must be lost before the trees' roots can rise to the occasion?

Of the hair manure I put 1lb. to a tree dug in a shallow circle 15" from tree stem and got fair results, which so far have not “gone off” (9 months after), but 1½ or 2lbs. might well be put.

Pari passu, the following clipping from a home exchange may be turned to advantage:—

Fertilizing fruit-trees.

“There is much yet to be learned respecting the fertilizing of orchard lands. In general, nitrogen can be supplied in sufficient quantity by thorough tillage and the use of occasional cover crops of crimson clover, peas, or vetch. In fact, it seems to be easy to apply too much nitrogen on some lands, causing the trees to make too heavy growth. Young trees make light drafts of potash and phosphoric acid, and it is probable that apples and pears do not need much fertilizing on good soils for the first three or four years, if they are given good cultivation, unless other crops are grown with them. But just as soon as the trees show an inclination to bear, judicious application of the mineral fertilizers may be made. If this fertilizing is begun thus early in the life of the orchard, and if the tillage is good, the application need not be very heavy, but they should be applied every year. Two or three hundred pounds of high-grade muriate of potash, and an equal weight of some high-grade phosphate (as Florida or South

Carolina rock or fossil bone) may be considered to be good dressings. Stable manures are excellent, but they are so seldom to be had in sufficient quantity that they are practically beyond reach.”

Prices, etc.

East India Coffee will, it is to be hoped, says the *Produce World*, net better prices in the days to come than such figures as 105s., 106s. and 107s., at which figures sales of good bold Coffee have recently been made. Now really these figures can hardly be called remunerative when shippers' interests are in mind. Such prices, however, are unfortunately all that can be obtained when a planter wants to clear out fifty, one hundred, or a hundred-and-fifty bags. What reason on earth is there to prevent that self-same coffee being sold direct to the small shopkeepers who are willing to pay, and glad to get the coffee at such prices as 120s., 122s. 6d., and 125s. per cwt. In speaking of East Indian coffee, it should interest some of our Indian friends to know that the stock of this grade is some 5,000 bags short of the stocks held for account of dealers and speculators in November, 1895. A correspondent, whose letter we publish in another column, calls marked attention to the glaring injustice of the allowance termed “Draft”—we have no wish to “give it away” too much, but at the same time we would like to have his opinion on the terms “first, second, and third class sea-damage.” It would be interesting to know what the Dock Company considers as “first-class-sea-damaged” and what the damage really amounts to. We know that the broker promptly knocks off a £1 per ton for first-class “sea-damaged” and the sender no doubt has the amount duly deducted in his account sale. Notwithstanding this, however, there are plenty of consumers who take this (so-called) first-class sea-damaged stuff at the ordinary rate, and the £1 per ton deduction disappears somewhere.

THE ONLY WAY TO IMPROVE OUR COFFEE STRAINS.

ADVICE FROM DR. MORRIS, DIRECTOR OF THE ROYAL KEW GARDENS.

The following is a letter in answer to some queries of ours, forwarded through a friend, regarding the advisability of replacing the disease-stricken coffee seed of South India with new and preferably wild strains. Our readers will note that, barring the valuable suggestion of beginning the experiment with first rate Blue Mountain seed (which has already been acted upon in a careless, haphazard manner), the gist of the sound advice Dr. Morris gives us is identical with that which appeared in our issue of December 5th from the pen of Mr. J. Cameron, of Bangalore.

There is one thing we would strongly impress upon our readers, and that is, the improvement of our strains is *purely a planter's matter*. It is a work in which everyone of us can take our part, though the first steps, *i.e.*, the introduction of first rate Blue Mountain coffee, might fitly be undertaken by the United Planters' Association.

Writing under date of 14th December 1896, Kew, Dr. Morris says:—

The suggestion [*i.e.* about going back to the wild stock.—ED.] is similar to many that reach me from various parts of the world. It is based really on a misapprehension of the means adopted by highly skilled horticulturists in working up improved stocks of cultivated

plants. Instead of going back to the original wild stocks these people start from the best of those now existing and by careful selection and cultivation produce strains of the highest merit.

Although plants affected by disease may have deteriorated individually, yet in a large area there would be found numerous individuals of healthy constitution and quite capable of responding to the influences of improved cultivation and a wise and skilful selection. If you go back to the wild stock you have to traverse afresh all the gradations of improvement already obtained, with possibly no better result than at present.

The only way to really improve the present coffee plant is, as your friend, who forwarded the letter.—Ed.] suggest, to carry on systematic experiments extending over several generations and seizing upon every indication of improvement to fix it at each stage until the desired result is obtained. To some extent, but not in a very scientific way, improvement had taken place in the character of the coffee cultivated in the Blue Mountains of Jamaica. The plants are prolific, bear large beans of good colour, and the produce is possibly the best of any appearing in European markets. It often fetches 142/ per cwt. The quantity is small owing to the difficulty of obtaining forest land suitable for extending the cultivation.

If the planters of Southern India were to import selected seed from the Blue Mountains of Jamaica the results would be much more satisfactory than starting with really wild plants. They would then start where the Jamaica people have left off.

We always take up any new species or varieties of coffee that we meet with, and we distribute plants for purposes of experiment—in fact to furnish the raw material for planters to work upon if they like. *Coffea stenophylla* is a case in point. This is very near *C. arabica* and may indeed be a wild form of it. I do not suppose, however, that planters will take the trouble to work at the wild plant for, say, twenty years in order to get an improved variety. Experiments on a small scale are worthless. *It is purely a planter's matter, to be solved only on the estates where coffee is largely grown.* [The italics are ours.—Ed.] Only one plant in ten thousand may show any characteristics of a desirable character, the same as in the sugar cane. Although some hundreds of thousands of seedling canes have been grown, only two have shown any special characters of a valuable kind.

If it is proposed to import Blue Mountain coffee seed from Jamaica, correspondence might be opened with Beresford S. Gosset, Farm Hill Coffee Plantation, Hagley Gap P. O., Jamaica. He is a reliable man who has excellent coffee fields.

BEES AND THE FERTILIZATION OF THE COFFEE BLOSSOM.

ON submitting the notes that appeared in our last issue on this subject to a local scientist whose opinion is much valued by the planters of the neighbourhood, we have received the following interesting communication:—

"I know very little about bees, but I should imagine a coffee estate is about the last place to find them in large numbers for the following reasons:—

1. The coffee plant is in flower for a very short period; and with the exception of this tree there is very little for the bee to get honey from. Even the shade trees do not flower, I suppose, more than once in a year. It is quite possible that should there be large cliffs close to the estate or anywhere within, say, for 8 miles the rock, bees will visit the blossom.

2. As a rule sweet-scented and *white* blossoms are fertilised at night by various sorts of insects such as moths, etc., and it is quite possible that thousands of these moths are about at night near coffee estates, especially as during the flowering period we have rain.

3. I am inclined myself to think that coffee is for the most part self-fertilising. The flowers are in dense masses, so that the slightest puff of wind would blow the pollen from the anthers with the probability of this pollen catching on to one of the adjoining stigmas. Of course the question has been raised whether a coffee flower is fertilised with its own pollen or from an adjoining blossom, but I fancy that as all the blossom opens at once, and therefore stigma and anthers are ready at the same time, it is immaterial whether the

pollen drops on its own or another stigma. That a bee will fertilize only 150 flowers a day is absurd. If you will notice a bee at work on a flower or flowers with the heads close together, you will be surprised to find the ground he gets over in a short time. I should say that in the case of coffee blossom a bee will visit at least 5,000 flowers in the day. You must not forget in mentioning clover blossom that it is differently constructed from coffee blossom. The latter is an open flower and could be fertilised by any insect, whereas the clover is a pea-shaped blossom and wants a particular insect to fertilise it. It is the humble bee, not the common bee, that does this.

I trust these notes may be of some use to you, but as you will see, they are mostly surmises. To keep bees near a place, you must have lots of flowers for them to visit; if you want a list of these, I will do my best to make one up for you.

Those who still have doubts on the subject and wish to be on the safe side by encouraging bees as much as possible will find the following notes from another correspondent of interest. On a large estate the honey and wax from a considerable number of judiciously placed hives should form a welcome addition to the manager's income, so that two birds might be killed with one stone.

My plan of hiving the country bee is very simple and is as follows:—An unfrequented spot should be selected, screened by rocks, trees, etc., as they dislike being disturbed in any way. The place should be sheltered from cold winds, &c., and should, if possible, be of a southern aspect. Ordinary low country chatties make good hives with the mouth turned down, and a small hole pierced in the side near the ground, but these should be covered or the sun is apt to melt the wax, and the combs will then drop out and the bees will forsake the hive. Wooden hives are also good, but should be so made that they shall have an angular depression in the roof to accommodate the honey formation which is always most abundant at the top of the combs.

When you have the hives all ready, you should keep a look-out for the bees sent out to look for quarters. These have a habit of searching everything and everywhere, and will follow persons about, trying to get into their coat-sleeves, hats, &c., and can be captured with facility, and should then be taken to a hive and shut in and kept there for a short time and then liberated. The bee thus treated will as a rule come out and then go in again several times, and if the place is a good one will go off to the swarm and induce a number more to come over and inspect, and if their verdict is favourable, the swarm will soon arrive and take up their abode in the new quarters. This is not always necessary, as they will of themselves often take up quarters in artificial hives. The yield from a good hive, where there is abundance of flowers, will average as far as two bottles each clearing, and you can have as far as four clearings in a year, care being taken not to remove *all* the combs, or the bees will swarm off.

I think the idea of encouraging bees is a very commendable one, and planters would do well to try and keep as many hives on or near their coffee as possible. As a rule wild bees are fairly numerous, but it would be well to augment their numbers by the above or other methods. I may add that the cost of the experiment would be "almost nominal."

DEEP CULTIVATION AND ITS DANGERS.

DEEP cultivation in connection with trees fixed permanently in the ground calls for the exercise of considerable caution; for injury to the roots not only checks the growth of the trees, rendering them liable to fall easy preys to blights and diseases, but also causes a direct decline in their cropping capabilities. This has, I think, been proved beyond all question in orchards, and I believe that if we followed the practice pursued in fruit culture on the continent and England as nearly as circumstances will allow, we would be on the safe side.

We see that in the case of orchards that the thorough preparation of the ground precedes the planting of the trees. The first thing done is to thoroughly drain the

land so as to render it sweet and of an equable temperature to a considerable depth and to insure the circulation of air and water throughout it. The next thing is to dig it over to a depth of two feet, taking care not to bring any of the subsoil to the surface, as this would dilute the surface soil and render it weak. The most approved method of cultivation which follows the planting of the trees consists in digging over the land to the depth of only a few inches and manure is applied on the surface, the object aimed at being to encourage the development of fibres near the surface which are chiefly concerned in the production of fruit. J. Cheal, F.R.H.S., in his treatise on Practical Fruit Culture, says in connection with improving old orchards:— “As to improvement of the ground, and the treatment of the roots of such trees, much may be done in this direction. There are some who advocate severely cutting back the roots by digging a trench a few feet from the stems all round the trees, and filling in this trench with fresh soil. The addition of the fresh soil undoubtedly does good by supplying the tree with fresh nutriment; but by cutting back the roots in the way named, I consider that as much harm as good is done by it, and the tree is considerably checked in growth for one or two years. A better plan is to dig the surface round the trees for a space of 6 or 8 feet from the stem, *but on no account let this digging be too deeply done.* (The italics are mine.) Merely turn over the turf, if there is grass below the trees, to a depth of 3 or 4 inches, the object being not to disturb or cut away any of the roots, but to feed, strengthen, and encourage them. The mere opening of the soil, and allowing the sun and air to penetrate, is in itself of some advantage, but it should be followed up by the application of suitable manure on the surface. This will encourage the formation of fresh fibres, which will soon result in a general improvement in the tree throughout. In some cases I have seen this digging carried out far too vigorously and too deeply, thus cutting away a great portion of fibre and smaller rootlets *which are the most valuable and in the best position of all for the production of good fruit.*” (Italics mine.) We arrive then at the conclusions:—

(1) That deep digging in the vicinity of fruit trees is hurtful by reason of its causing injury to the surface fibres and rootlets; and

(2) That the cultivation of fruit trees should be so directed as to encourage the formation of fresh fibres at the surface. I suppose it requires no argument to establish the claim of a coffee tree to be considered a fruit tree; yet I don't know. Only the other day a planter asked in the *Madras Mail* whether the coffee tree was an entomophilous tree, yet I thought its claim to be considered such had been long established. There is really no necessity for a place to be deeply dug once the ground has been thoroughly drained and prepared, for it is only the surface which is apt to get hard and requires to be broken and stirred to give free entrance to the rain water which would otherwise flow over the land. Once the water enters, the air follows and keeps the land thoroughly aerated. I may show by an illustration how the surface soil can become hard without the under soil, once it has been

thoroughly drained and prepared, becoming consolidated. Every one is acquainted with rammed earth walls. In order that these should be a success, it is necessary that a little earth at a time be filled into the mould boards and pounded thoroughly all the way up till the boards are filled. If on the contrary the boards were filled to the top at once and rammed at the top, it does not matter however much they may be rammed, the few inches at the top becomes consolidated while the rest is soft and crumbly. It is the same with soil that has been thoroughly prepared except that as there is less pressure put upon it, the under soil can hardly become hard to anything like the same extent as in the case of the rammed earth walls.

Of course in opening a clearing it would be impossible to entirely follow the practice of orchards owing to the large areas that have to be planted; but a compromise might be entered into. Cheal recommends that in the case of large areas where pits have to be made to receive the plants, that drains should be opened out in every second row and all the pits connected by small drains with these larger ones in order to prevent them becoming so many receptacles for stagnant water. This would be an excellent plan to follow in connection with coffee or tea. Or the rows of pits might be all connected by a narrow drain of the same depth of the pits and both filled in at the bottom with rubble. A thorough drenching might follow the planting, as no injury need result to the roots of the young plants as there would be no necessity to dig close up to them. After this only superficial stirrings would be all that would be necessary. To argue that in shallow digging that the loose soil will keep the roots going for a few weeks; that it soon gets dry as dust; that the roots cannot penetrate deeply; that there is nothing to induce them; that the leaves droop and development stops, &c., is absurd; for the loosened soil at the top acts as a soil mulch which breaks the continuity of the capillary tubes to the surface, prevents the evaporation of the moisture which is brought up by capillarity from the depths below, and keeps it where it is most wanted in reach of the surface fibres.

It is also argued that deep cultivation causes the roots to go down into the subsoil in search of coolness and moisture in the hot weather. What is stated above shows there is no necessity for this. The fact is that deep cultivation in cutting away and injuring the surface fibres causes the tree to be dependent on its lower roots; but how can this be beneficial when the subsoil in all cases is poorer than the surface soil? Failure of blossom I believe is due rather to this cause and to rough clod digging. Where the surface soil is kept *finely* stirred and the development of roots fibres encouraged, failures of crop would, in my opinion, be less apt to occur. If the roots were induced by deep culture to dive into the subsoil how could the tree be possibly properly nourished? Isn't mostly all the nutriment contained in the soil? Some nitrates and lime would perhaps be recovered in this way, but the minerals would be in an unavailable form. And as for the roots going down into the subsoil in search of coolness and moisture, I believe plants flourish best when their roots are in as warm a medium as their leaves and branches.

H. G. R.

TEA.**The New Chinese Tea.**

The first trial breaks of machine-made China tea is reported on most unfavourably in "the Lane." It is said to be poor stuff and quite unlike Indian tea.

Proposed tea duty in Canada.

There are serious prospects of tea-duty being imposed in Canada, and we may therefore look for quite a spurt in imports in the next few months.

The Russian Market.

In 1894 Russia imported some 78 million pounds of China tea (34 M. leaf tea *via* Odessa, and 44 M. Brick, etc., overland). Value of the former retail is from 85 kopechs to 5 paper roubles per Russian pound, and for the latter about 2½ roubles per lb.

Ceylon estimates for 1897.

The local *Observer* estimates the yield for the year at 120 million pounds, or 15 above last year's crop. Its rival, the *Times*, falls foul of this and decries such premature forecasts, and wants to wait till the official estimate is given.

Russia as a tea-district.

There are again persistent rumours of a large extension of tea-cultivation in the Caucasus, and the importation of Chinese "tea-planters" is said to be increasing. As long as they stick to China in the matter of cultivation and manufacture, we need not trouble ourselves much about it.

Calcutta exports.

From the monthly return of the I. T. A. Clearances, dated 14th December 1896, we note that almost 8 millions more were cleared this season from Calcutta up to the end of November than at the corresponding period in 1895. The total exports from Ceylon were also nearly 8 millions in excess of last year.

Exchange samples.

In our correspondence columns "P." urges that Nilgiri Tea Planters should abandon their present ridiculous system of keeping their factories locked to all brother planters, and treating the details of manufacture as profound and valuable secrets. Free interchange of samples is a necessity, if these Hills are ever to take a higher place than the fourth rate one they now occupy. This reminds us of a planter who, when asked by a brother planter for samples for tasting, said he would only give them on payment!

The African Market.

Unless some very decided impetus be given to the Natal tea-industry, Africa will in the near future afford an outlet for Indians and Ceylons by no means to be despised. The Natal jât is good as far as regards its pedigree, but careless pruning, plucking and manufacture result in a most inferior article. The labour supply too, it must be remembered, is imported all the way from India, so that excepting the duty we have the pull all round. The 3,000 acres under cultivation are

close to the sea-coast, having an elevation of 100 to 500 feet only, with a scanty rainfall of 40 to 48 inches.

Ceylon tea prices.

In its review on the past year's prices, the *Times of Ceylon* draws attention to the unsatisfactory drop of ½d. compared with 1895 and 1894, i.e., 8¼d. against 8¾d. Added to this, the rise in exchange has helped to reduce profits all round. In fact exchange is actually 2½d. higher than it was two years ago. Certainly the Indian average of over 9d., which is probably what it will run out to, affords a striking contrast to the Ceylon 8¼d. The reason for the better prices is said to be the greater skill or attention in manufacture.

Nor is the Colombo market more satisfactory, though compared with 1891 and 1892, it shows no change, being 41 cents per lb. Last year it was however 47 cents, but this was a record. The quantities disposed of on the other hand in Colombo show a marked increase, being almost 25½ million pounds against over 9½ millions in 1891.

A retrospect and a forecast.

The season, which is now nearing its close, began exceedingly well, but latterly prices have declined steadily. Subsequently, however, says the *Grocer*, the yield of many gardens turned out disappointingly as regards the quality, which showed a marked falling off from the character of the invoices imported at the opening sales, so that since then the demand at times has perceptibly flagged, and prices have been more or less weak. Autumn-flavoured kinds of the better class have mostly been taken at full rates, but "Calcutta-bought" teas, as they are termed, together with low medium and commoner sorts, whether leafy or broken, below 1s. per lb., have been disposable only at a repeated decline, till they were 1d. to 2d. cheaper than at the starting point. Though the results financially may not have been entirely satisfactory to importers, the cheapening of the article has had the salutary effect of greatly stimulating consumption, as is evidenced by the heavy quantities that pass out of the bonded warehouses every week; and the duty-paid entries on this description of tea in the United Kingdom for the first ten months of the year, as officially stated, amounted to 99,732,168lb., against 93,844,535lb. in 1895, and 95,994,441lb. in the corresponding period of 1894. Favourable as these facts may appear to the interests of consumers, there is still the possibility of the trade being overdone with an excessive glut of tea, and this too just when the heaviest importations from Ceylon are usually expected, which must swell the aggregate supply on offer, besides helping to establish an additional reduction in value all round. With this prospect before them, dealers and retailers generally may reckon upon having, as a benefit, a long continuance of cheap tea.

The London Market.

Referring to last week's tea sales the *Produce Markets Review* says: "Indian teas continue to be freely brought forward, and upwards of 54,500 packages were catalogued, establishing a record in quantity for one day's sale of 35,000. With such a heavy weight of tea to be dealt with it is not

surprising that there should have been some irregularity in prices, but considering the number of samples to be tasted and valued the market on the whole remains very steady. This steadiness is due to the increasing demand, which may be accounted for by the exceptional value now offered, and it is quite probable that the consumption for the season will materially out-distance any previous one. The Medium, Whole, and Broken Pekoes have fallen to a point which induces the retailers to use them in their blends more liberally than ever, and with the present favourable conditions the consumption will doubtless continue on a large scale. It seems evident from a recent estimate of the crop that there is no probability of any advance in values such as was the case in the early part of this year, as the supply is ample to meet any reasonable increase in the consumption. In the lower grades of both whole and broken leaf an improved business has been transacted, many of the teas showing better quality, of which buyers are taking advantage. The better descriptions are more plentiful, but in consequence of the good demand for them values remain steady, while for the finest sorts the market is very firm, the quantity on offer being moderate. Of the 54,997 packages offered at the public sales 48,000 sold, and a good portion of the balance has since been disposed of privately. The demand for Ceylon tea continues good, and the larger supplies brought forward at the public sales on Tuesday met with ready buyers at firm rates generally. For all good and fine descriptions values are comparatively steady, with an occasional slight decline in Broken Pekoes worth about 11d to 1s, and in teas with good appearance but giving a thin infusion. The finest grades of both whole and broken leaf keep firm at about late rates, which will probably be maintained, as the proportion is likely to show some diminution later on. Common broken descriptions have displayed a somewhat easier tendency, but similar grades of leafy teas are unchanged, and good Pekoes from 6½d. to 7½d. are still difficult to obtain. At the public scales 27,500 packages were offered, of which about 2,500 were withdrawn. The shipments from Ceylon to the United Kingdom to the 17th instant amounted to 80,925,879lb., against 73,319 507lb. to the same date last year, or an increase of 7,606,372lb.

DISTRICT ASSOCIATIONS.

WYNAAD.

PROCEEDINGS of a General Meeting held at the Club, Meppadi, 2nd December 1896. Mr. C. E. Abbot in the Chair.

PRESENT.—Messrs. C. E. Abbott, De Fonblanque, R. Lamb, D. Mackenzie, W. Mackinlay, J. R. Malcolm, A. Trollope, and B. Malcolm, *Ag. Hon. Secretary*.

I. U. P. A. S. I.—

(1) *Mr. Hockin's Expenses*.—Read letter from Mr. Hockin dated Nov. 23/96 and *Ag. Honorary Secretary's* reply.

(2) Read copies of Mr. Hockin's letters to the Secretary, U. P. A., and Mr. Hockin's letter of Nov. 26th referring to them.

(3) Read circular from the letter Secretary, U. P. A., *re* Trust, fund subscription lists. Recorded.

(4) Read Confidential circular letter from Secretary, U. P. A. Recorded.

(5) Read circular letter from Secretary, U. P. A., having reference to the resolution of the Shevaroy Planters' Association *re* the adul-

teration of coffee, and the formation of a Coffee Association for the prevention thereof. Also the Chairman U. P. A.'s letter on the subject. Recorded.

(6) This Association agrees with the Chairman, U. P. A., that the present is not the time to move in the matter.

(7) Read letter from the Secretary U. P. A. in reply to the *Ag. Honorary Secretary's* letter of Nov. 7th *re* extra subscription for 1895-96. Recorded.

2. *Import Duties*.—Read letter from the Secretary U. P. A. asking for statistics required by the Govt. of Madras regarding the quantity of artificial manures used in the district during the past 10 years.

Resolved that the Coast Firms be requested to supply the information and that the *Ag. Honorary Secretary* be instructed to write to them on the matter.

3. *Cutcherry at Meppadi*.—Read the *Ag. Honorary Secretary's* letter to the Collector of Malabar, and his reply, stating that the 2nd class Magistrate will be requested to hold Cutcherry at Meppadi on the 2nd Monday & Tuesday in each month.

Recorded with satisfaction.

4. *Coffee Robbery*.—Read *Ag. Honorary Secretary's* letter to the Superintendent Police regarding Police arrangements for this season. Recorded.

5. *Roads*.—Resolved that the *Ag. Honorary Secretary* be instructed to write to the Collector of Malabar to ascertain what steps have been taken with regard to H. E. The Governor's reply to the Deputation.

6. *Agenda Paper*.—This matter was postponed until the Annual General Meeting.

7. *Hon. Secretary*.—This Association receives with regret Mr. Hockin's announcement of his resignation as *Hon. Secretary* of this Association and hope he will reconsider his decision.

Papers on the Table.

Proceedings of Genl. Meeting, Palney Planters' Assn. Sept. 2/96

" of Genl. Meeting, Shevaroy " " Oct. 12/96.

" Committee " " " Nov. 2/96.

" Ceylon Planters' Assn. for year ending Feby. 17/96.

Planting Opinion November 21/96.

A vote of thanks to the Chair terminated the proceedings.

(Sd.) C. E. ABBOTT,

Chairman.

(„) BERNARD MALCOLM,

Ag. Honorary Secretary.

The Annual General Meeting of this Association will be held at the Club, Meppadi, on Wednesday, January 6th, 1897.

ROUND THE BUNGALOW.

NOTES BY A PLANTER'S WIFE.

A novel twine box. A novel way of utilizing Patent Barley or Cornflour tins is to make twine boxes of them, which is easily and quickly done in the following manner. Take a ball of Macranie thread, or two balls of different colours, say willow green and rose colour, and work in stripes of the two colours; with a medium size bone crochet hook make 6 chain and join in a ring; into this ring work 10 double crochet, which completes the first round: 2nd round, work 2 double crochet into the first double crochet of last round, inserting the hook to take up the two front threads of the stitches of last row; * 1 double crochet into the next stitch, 2 into the next stitch, repeat from * until the end of the row.

3rd row same as 2nd.

4th row 1 double crochet into the first 4 stitches of the 3rd row * 2 double crochet into 5th stitch, 1 double crochet into each of the next 4 stitches, repeat from * until end of row.

5th row. 1 double crochet in each of the first three stitches of the last row, * 2 double crochet into each of next three stitches, repeat from * until end of row.

6th row, same as 5th, and fasten off; this will now look like a small round mat and will fit the top of a Patent Barley tin; now a plain piece of crochet will be required for going round the sides of the tin which must be worked in the following manner: make a chain

of 44 stitches and one extra for turning into each of the 44 stitches, a double crochet must be worked, and to turn, one chain must be made at the end of each row—about 20 rows of this plain crochet will be required, but it will be better to measure the depth of the tin and work until it is the right width, as it much depends upon the worker as to whether she works tightly or not; it should be worked pretty tightly, otherwise the tin will show through. Now fasten off the plain piece of crochet, and with a coarse needle or bodkin sew the plain piece to the round top first made; the easiest way of doing this is to place the round piece on the top of the tin and the plain piece round it, when it can be pulled to make it fit nicely and then stitched round the edge, lastly sewing it down the side of the tin; this is of course the wrong side of the cover, so it must be taken off, and a small strap of crochet must now be made with 8 chain, turn and make 1 double crochet into each chain, repeat 3 times, fasten off and stitch it on the tin cover about half way down; this is for holding a small pair of scissors, or instead of a crochet strap, a strap of ribbon might be used. Next make a small pin-cushion, say diamond, or any other shape preferred, in the following way: cut two pieces of thin card board $2\frac{1}{2}$ " long in the desired shape, cover each side with silk, velvet or sateen and sew them together very neatly round the edge, put a small loop of ribbon at one end, and stick both black and white pins round the edge; stitch the loop to the top edge of the crochet cover: now take the tin and make a hole at the top for the twine to come through, pull the twine also through the top of the crochet cover, pull the cover over the tin, place a pair of small scissors in the strap, and you will have a pretty little string box which will be of both use and ornament on either a lady's or gentleman's writing table.

An old frame made new.

Thoroughly cleanse any old gilt or wooden frames you may wish to renovate, scrape away all roughness, and proceed to paint all over the front and sides with a coat of size. Upon this sprinkle some grains of rice or sago, allowing them to lie fairly thick, and, when perfectly dry and set, proceed to wash over all some good gold paint. Two coats will probably be necessary, but great care must be taken that the first coat is absolutely dry before the second is applied. When complete, the frame so renovated will present a charming and very uncommon appearance, more especially if sago be used instead of rice, as this grain is rough and gives a rustic appearance to the surface upon which it is used.

To purify water.

It is not generally known that pounded alum possesses the property of purifying water. A tablespoonful of pulverised alum sprinkled into a hog-head of water (the water to be stirred at the time) will, after the lapse of a few hours, by precipitating to the bottom the impure particles, so purify it that it will be found to possess nearly the freshness and clearness of the finest spring water. A pailful containing four gallons may be purified by a single teaspoonful.

Be careful with canned foods.

I read the following the other day, and think it should prove useful to numbers in India who have in a great measure to depend upon canned goods:

In buying canned goods, an eminent physician's instructions are to "reject every article that does not show the line of rosin round the edge of the solder of the cap, the same as is seen on the seam on the side of the can. Reject every can that does not have the name of the manufacturer or firm upon it, as well as the name of the company or town where manufactured." Standards have all this; when the wholesale dealer is ashamed to have his name on the goods, fight shy of him. Press up the bottom of the can. If decomposition is beginning, the tin will rattle the same as the bottom of the oiler of your sewing machine will do. If the goods are sound, it will be solid, and there will be no rattle in the tin. Reject every tin that shows any sign of rust around the cap on the inside of the head of the can. If house-keepers are educated on these points, then the muriae of zinc amalgam will become a thing of the past.

Maypole soap.

This wonderful soap is most useful to all wearers of the blouse; by it white blouses, dresses, underlinen, children's frocks, etc., etc., may be dyed any colour one wishes, or faded colours restored, by simply washing the faded articles with this soap. I have never seen it advertised out here, so wrote to the manufacturers in England, asking if it was procurable in India; to this they have replied that it is procurable from Messrs. J. B. Foster & Co., Chemists, South Parade, Bangalore;

also Messrs. Whiteaway, Laidlaw & Co., Calcutta. I have seen some lace washed with this soap, which looks lovely.

THE MAN WHO KNOWS THE ROAD.

He drives directly home, even in dark nights, does the man who knows the road. The over-hanging gloom, the deceptive shadows, the uncertain sounds, don't bother him. He can feel the ground under his waggon wheels, and the "lay of the land" is open to him as at clear noontide. It is the stranger in those parts who is confused and befuddled, who knocks people up to ask questions, who finally lodges in the ditch.

Where to go, and how to get there; what to do, and how to do it—why, the man who knows that comes to the front everywhere and always. But the opposite—the waste of time, money, power, health, &c., in blind experiments, how disheartening and disastrous it is! Take an illustration of this sort, and you will see how it fits in a minute.

"In the spring of 1892," says a lady who lives down near the east coast, "I began to feel ill. I had a poor appetite, and after everything I ate, no matter how simple it was, I was seized with great pain across the chest and around the sides. I was frequently sick, vomiting a sour, bitter fluid. I was almost afraid to eat, and my food gave me no strength. In this state I continued, now a bit better, and then worse until December, 1893, when I became very ill. I got so weak I could hardly bear the weight of my body on my feet. *I tried this and I tried that—all kinds of medicines I heard of, but none of them gave me any relief.*

"In January, 1895, I read in a little book about the cures done by Mother Seigel's Syrup. The book contained letters from people who had been cured, some of whom had suffered like me. I got a bottle from Miss Caroline Foster, grocer and draper, High Street, in this place. After taking it I was much better. I had a new relish for food, and no more distress after eating. I continued taking Mother Seigel's Syrup, and was soon free from all pain and sickness and fast gaining strength. Since then I have been in the best of health, and needed no medicine. (Signed) Mrs. Eleanor Clay, Messingham, Brigg, Lines, April 30th, 1895."

"In the early part of 1875," writes another, "my health began to fail me. I felt low and weak, and lost all power and disposition to exert myself. After every meal I had pain in the chest and all over me. I felt so tight around the waist that it seemed as though something was holding me. I was much troubled with a sickening wind coming up from my stomach; and now and then I belched up a sour fluid that bit my throat and half choked me. Then, too, I had attacks of spasms, which gave me intense pain. I got about my work slowly and in much distress, and grew gradually weaker and more despondent in mind. *I tried all the various medicines I could hear of that might possibly be good for me, but none of them were of any avail.*

"After five tedious years of suffering, my daughter, who is in service in London, wrote me of the benefit her mistress has derived from the use of Mother Seigel's Curative Syrup when troubled much as I was. I replied, and my daughter sent me two bottles of the Syrup, and after having taken it, I felt quite like a new woman. I had no pain after eating, and was in better health than I had been in since I was first taken ill. From that time onwards my health was good, and if I ail anything temporarily, as the best of us will, a few doses of Mother Seigel's Syrup put me right. I have told many persons of what this now celebrated remedy did for me, and am willing you should publish my statement if you desire to do so. (Signed) (Mrs.) Ann Knight, near the Church, Fenny Compton, Leamington, September 27th, 1895."

By looking back to the italicised words in these letters the reader will catch my point on the instant. Both these ladies, not knowing the true remedy for their disease (indigestion and dyspepsia), blindly experimented with anything they could get hold of. Under like circumstances we all do the same. When one doesn't know the road he is almost certain to blunder and stumble; and he can't know until he learns. Now, in all ailments of the digestion, with the local symptoms which proceed from it, Mother Seigel's Syrup is, so to put it, the *right road*. Follow it faithfully, and you are fairly sure to bring up in the pleasant shelter of good health. Knowing this, direct your neighbours.

MARKET SUPPLEMENT.

SATURDAY, JANUARY 9, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (Dec. 18, 1896) says:—Small supplies were offered this week in auction, but the market has been dull and values show no material change.

No East India was offered.

The catalogues consisted chiefly of Central American, which met a slow demand at about previous rates.

In consequence of the Christmas holidays Public Sales are suspended from to-day until 6th January 1897. Fluctuations in the "Terme" market have been unimportant during the past week, and at the close quotations show a decline of 6d to 1/- since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending December 16th, 1896, says:—The Bank rate remains at 4%. Bombay Exchange closes at 1s 3½d. Brazil Exchange 9½d. Rupee paper 3½% 62½. Silver 30d per oz.

This market remains quiet, the demand at auction continues dull for all kinds, except finest which is very scarce. The first shipment of New Crop Plantation Ceylon realized very full prices, viz. 123s for bold colory, 111s 6d for first size, 106s for smaller, and 130s for peaberry. Brazil markets continue steady.

Daily receipts have averaged 11,125 bags in Rio, and 14,125 bags in Santos.

Futures have been less active, and have shown a declining tendency, the close being weak at a decline of 1s to 1s 6d, viz.:—Good average Santos in Havre, December delivery closes at fcs. 60.00, in Hamburg pf. 50½, and No. 7 low ordinary Rio in New York \$9.30.

To-day's London official quotations are:—

	Dec.	March	May	Sept.
Rio	48/-	48/3	48/3	—
SANTOS	50/-	50/-	50/6	51/3

We quote:—

Indian. The week's sale comprised only 40,641 packages, against 54,977 last week. Teas from Assam and Dooars are now coming in of better quality, and where liquors showed any improvement the market readily responded, with the result that prices were more satisfactory. For Teas without special point, buyers evinced little desire to purchase, even at the low rates recently current, and here and there the market showed decided weakness, although the present range of prices for good useful liquoring Teas, as well as the poorer grades, stands upon an unusually moderate basis, some of the Teas being as cheap as they have ever been. Reuter's telegram from Calcutta gives exports to U. K. from 1st May to middle of December as 110,620,000 lbs., against 103,730,000 lbs. The official wire from the Indian Tea Association gives exports to U. K. from 1st April to middle of December as 113,000,000 lbs., against 106,000,000 lbs. to same date last season.

Week's av. Tea sold on Garden Account, 1896, 32,347 pks., av. 8½d. 1895, 36,818 pks., av. 9d. 1894, 13,333 pks., av. 10d.

	1896.		1895.

PEKOE. (Greyish to blackish, some tip, useful liquor) ...	7¼d	7¼d	9d	7¼d
PEK. SOUG. (Blackish greyish, inferior liquor). ...	4¼d	5¼d	6¼d	5¼d
PEKOE. (Blackish greyish, some tip, inferior liquor) ...	5¼d	5¼d	7¼d	6¼d

Ceylon. Auctions comprised 24,253 packages against 27,553 last week. The market was fairly active for most descriptions, although, among the poorest liquoring Teas a further slight fall was here and there noticeable, probably owing in a great measure to the low prices ruling for Indian Teas of this class. For other grades the market was inclined to be slightly irregular, and medium liquoring Broken were here and there rather depressed. Private telegraphic advice gives the exports to the United Kingdom for the first half of the month as 2,800,000 lbs. and estimates the quantity for the whole month at 8,500,000 lbs. Average for week rather over 8¼d. against 9d. for same period last year.

Comparative prices of Ceylon Tea in London :—

	1896.	1895.	1894.	1893.
PEKOE SOUG. (Ordinary leaf; fair liquor) ...	6¼d	6¼d	7¼d	6¼d
PEKOE (Ordinary leaf, little twist; fair liquor) ...	7¼d	7¼d	8¼d	8¼d
PEKOE SOUG. (Rather bold leaf; indifferent liquor) ...	4¾d	5¼d	6¼d	5¼d
PEKOE (Somewhat bold leaf; indifferent liquor) ...	5¼d	6d	7d	6¼d

Java. The 872 packages consisted of Teas of direct import, the market ruling steady. 108 packages from "Perbawatee" realized an average of 1/- per lb., and 108 packages from "Goalpara" 11¼d. per lb.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, JANUARY 23, 1897.

[No. 2.]

MANAGER'S NOTICE.

Back Numbers Wanted: One each of Nos. 16, 27, 29 and 30, at one rupee per copy, or exchanged as below.

Offered in exchange or at eight annas per copy Nos. 2, 3, 5, 7, 9, 10, 13, 18, 19, 20, 21, 22, 23, 26, 28, 31, 32 and 33.

N.B.—It is particularly requested that the names and addresses of the *senders* be legibly written on the covers of the papers despatched.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 5th February 1897.

Wynaad.

MEPPADI, 11th January 1897.—*Weather* has been fine for the past fortnight. Cold and bracing. Good for man and coffee bush trees. *Crops* have been coming in faster and are approaching completion. Outturns up to the average as a rule. *Plant-diseases.*—Leaf disease beginning to pass off; had a bad attack this year. Coffee grown through it better than usual. *General Health.*—Usual lung complaints owing to cold weather.

North Wynaad.

MANANTODDY, 19th January 1897.—*Weather.*—The season continued hot until 9th inst., when first cold weather set in. Thermometer 56° at 6 A.M. There has been no rain this January to date, beyond a very few drops on 18th. *Crops.*—Coffee picking finished in some parts of "Bamboo." Paddy nearly all in. *Plant-diseases.*—The cold, misty nights and mornings and sea-breezes have had a most excellent effect on the coffee. *General Health.*—Fairly good. *Grain.*—Pretty cheap.

Nilgiris.

SHOLUR, 17th January 1897.—No rain since last report and no frost: highest and lowest temperature between 6 A.M. and 6 P.M., 39° and 68°. Tea still flashing, but leaf very light. I note your correspondent's remarks in your last issue. A comparison between Ootacamund and Sholur reports shows a difference only of 3 inches in rainfall, and the number of days on which rain fell is identical (though Ooty being higher has had frost which Sholur escaped), so I imagine Sholur reports may be taken as representing the N. E. corner of the plateau. Ragi 24 seers per rupee and labour plentiful and health good.

KOTAGIRI, 21st January 1897.—*Weather.*—Fine and cold, but no frost to speak of so far; heavy dew at night on the coffee. *Crop* at low elevation nearly all in, stripping and pruning commenced; outturn has not improved, one estate that got in 60 tons last year barely shows 45 this year on the same amount of cherry gathered in, another shows 460 bushels parchment out of 2,200 bushels picked, with cut bean and light thrown in, making up the wretched outturn of about 10 bushels parchment, cut bean and light for 38 bushels cherry; this is low down where last year's rain aggregated only 10" to the end of August. Other estates higher up run $\frac{1}{2}$ and $\frac{1}{2}$ and are giving fair crops. Spike low down is already far forward; there is rain in the air and an early blossom is expected. An old planter reports his best crop resulted from a February blossom; labour has moved in more freely since that blessed "Nomb's pandy" (Pongul) which played the mischief with field work all last week. Grain rates still unjustifiably high this side.

GENERAL NOTES AND ARTICLES.

PLANTING STATISTICS.

In a recent leaderette under this heading, the *Madras Mail* remarks with satisfaction that a beginning has at last been made in the collection of statistics relating to the planting industry. In noticing our "Planting Directory"—by the way we delayed sending copies for review till our revised summary was out—our contemporary incidentally

PHELPS & CO., Fashionable Tailors and Costumiers, 16, Old Court House Street, Calcutta. (Ladies' Department: 4, Russell Street.)

says that the figures given by us are "rather more complete" than those furnished in the Appendix to the third Annual Report of the U. P. A. S. I. That this opinion is borne out strongly by facts will be shown by the following table of comparison, taking only the figures for coffee, and omitting fractions of hundreds for the sake of clearness:—

	U. P. A. S. I.	PLANTING DIRECTORY.
Mysore	... 12,900 acres	24,500 acres.
Wynaad	... Nil.	8,800 "
Coorg	... 8,500 "	18,800 "
Nilgiris	... Nil.	10,800 "
Travancore	... 4,100 "	3,500 "
Pulnies	... 2,500 "	2,000 "
Nelliampatties	... 3,700 "	4,100 "
Shevaroyes	... Nil.	2,400 "
Total	... 31,700 "	74,900 "

By the above comparison we do not intend to cast any invidious reflections on either the Secretary to the U. P. A. S. I., who, we understand, is proving a decided acquisition, or the Honorary Secretaries of the District Associations. The former can only work through the latter, and the latter, with the best intentions, are powerless without the aid of the individual members of their Associations. The greatest delinquents, who furnish no statistics at all, are the districts of the Nilgiris, Wynaad, Shevaroyes and South Mysore. And indeed we ourselves have no great cause for congratulation in the matter of furnishing complete statistics, seeing that while estimating the total coffee area in South India at the round figure of 300,000 acres, we can only give details of under 75,000! It must be noted here, nevertheless, that quite half the total acreage is in the hands of natives, from whom very little if anything can be obtained in the way of furnishing returns. There is yet a vast deal to be done in the collection of accurate returns of acreage, and while the planting industry may rejoice itself in the fact that a beginning has at last been made, it must be remembered that it is only a beginning.

The last page of the Appendix of the U. P. A. Report contains some very interesting figures, though very incomplete we regret to say, on the different rates of wages, grain and so on. We extract the following:—

DAILY PAY AND COMMISSION, &c.

	Men.	Women.	Children.	Commission.	Advances.
	A.	A. P.	A.		
Coorg	4	2 6	1 to 2	10 to 15%.	Tamils Rs. 5 to 10; Canarese Rs. 15 to 20
Mysore, South	4	2 to 3	...	...	Rs. 10 to 20
Nelliampatties	5	3 0	2 0	10%	" 5
Lower Pulnies	4	2 6	1 to 2	10%	" 5
Travancore, Central.	4	...	...	3½p. per head.	Men Rs. 10; Women Rs. 6.
" North...	4½	2 0	...	5p. per head if over 50% are women and children. Otherwise 10	Rs. 10
Wynaad	4	2 8	...	10	...

In the contract works, rates differ very widely. Take for

instance weeding. In the Nelliampatties it is as high as Rs. 18 per acre per annum, while in the Lower Pulnies it is only Rs. 3 per annum, while on the Kannan Devans it runs to say Rs. 6 per annum.

The prices given for grain are hopelessly confusing for purposes of comparison, as the unit, the seer, differs greatly in every district. It would effect a useful purpose if the rates were given in weight in English pounds; at present they are quite useless. Lastly we must draw attention to the very commendable idea of furnishing details of crops of the different products. At present the returns are lamentably incomplete, but such as they are, are most interesting. On the Nelliampatties, we note the average yield of coffee is said to be about 3 cwt. per acre, while on the Lower Pulnies the yield runs out to slightly under 2 cwt. per acre, though it must be noted that almost half of the individual returns in this case are marked as "uncertain, probably considerably underestimated." In Central Travancore the average works out to a little over 1½ cwt. per acre. No figures are given for the other districts.

The only figures relating to tea yields are from Travancore. The Central District, with a probable yield of slightly under 1½ million pounds, averages 390 lbs. per acre for tea over two years; and South Travancore shows a yield of 360 lbs. per acre, or say about 2 million pounds.

We may conclude by quoting the rough figures given in our Directory. Therein we assume the total plantation area to be about 650,000 acres, of which 324,500 are cultivated, with coffee (300,900), tea (18,000), and cinchona (6,500). We estimate Mysore at 143,030 acres of coffee, Coorg at 84,000, Nilgiris and Wynaad at 48,000, Shevaroyes at 11,000, Travancore at 6,000, Nelliampatties at 5,000 and the Pulnies at 3,000. Of the 18,000 acres of tea we have reckoned that Travancore has about 10,000 acres, the Nilgiris 6,500 and the Wynaad about 1,500 (the figures for the latter district will probably be 3,000 acres at least by the end of the next planting season).

Planting Companies.

During the past year there has been a great rush in floating tea and coffee planting companies, new capital to the extent of 7½ million sterling being sought for.

Teosinte.

This fodder appears to be a most valuable one, and one which should be tried instead of guinea grass. No damage need be feared from either pigs or porcupines, who leave it severely alone, though they will attack Indian corn, oats, wheat, barley, &c., for the grain. The seed affords a valuable food for poultry, who eat it readily, despite its great hardness. We shall be glad to procure seed and give details of cultivation if desired.

The field manure factory.

This is how a Yankee reckons out the value of a yearly crop of lucerne. Its nitrogen is equal to 1,750 lbs. nitrate of soda, its phosphoric acid to that in 600 lbs. bone-black superphosphate, and in potash to that in 1,200 lbs. muriate of potash. In America this would cost about 124 dollars, but in India it reckons out roughly to Rs. 300,

PHELPS & CO., Calcutta, have probably the largest and best assorted stock of Woollens in India and will be pleased to send patterns and form of self-measurement.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better one, or in want of a manager, assistant, or writer, &c., is entitled to insert an advertisement to that effect free for as long a period as desired. These advertisements will appear on this page. Non-subscribers will be charged the small fee of one rupee.

To be worked in conjunction with the above, we have established a register, and names will be entered on application, together with copies of their testimonials. Thus should any enquiries be made for the services of a manager, assistant, &c., the names and testimonials will at once be forwarded, saving delay and trouble. Subscribers may have their names entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO

A Surveyor Of 25 years' experience, trained in the Imperial Survey Department of India and Engineering College, Roorkee, is prepared to undertake extensive Trigonometrical, Topographical and Engineering Surveys and Levelling and make working plans on the largest scale at somewhat the same rates as the Government Cadastral Surveys which will vary with the area and scale of the survey and amount of detail required.

Full particulars on application to

A. HALL,
C/o Editor.

Three.

Field Overseers. Field Overseers from November 1896 in opening new clearing. Salary Rs. 20 to 25 per mensem. Natives only need apply.

Apply to A. H. SHARP, Esq.,
Devikulam.

Coffee Writer. Wanted on a Coffee Estate an Under-Writer who understands field work and accounts. Must be young, active, and willing. Must speak and write English well.

A labour connection is necessary. No one without these qualifications need apply. Good salary.

M. A. T., C/o this paper.

BILLETS WANTED BY

Young Tea Planters. Wanted position of Trust or Assistant on a Tea or Coffee Estate in S. India. Has had two years' experience in Assam. Is willing to work 6 months without a salary till he has learnt local conditions. Good references.

"A. K.,"
C/o Editor.

u. c.

Tea or Fruit. Wanted an appointment as Manager or First Assistant in tea or fruit. Ten years' practical experience, well up in the cultivation and manufacture of tea, and also in the management of English fruit trees. Bachelor, age 29, active, hard working, sober habits, excellent testimonials and information from the Manager of this paper. Can join at once.

KUMA,

By Young Planter. Wanted a billet on Coffee Estate by young planter of three years' experience under well-known planters. Excellent testimonials.

"ROCHESTER,"

Three.

C/o Editor.

Young Coffee Planter.

Wanted by a young planter, charge of a Coffee Estate. Experienced in all branches. Salary Rs. 200.

"D. D.,"

Three.

C/o Manager.

Coffee Planter.

Wanted a situation in Coffee as Superintendent or Manager by a European with over twenty years' experience.

Apply D.,

u. c.

C/o Manager.

Superintendent.

Wanted a billet as Superintendent of a Coffee Estate by a planter of 14 years' experience; testimonials and references given if required.

Apply PADDY,

u. c.

C/o this paper.

Tea Planter.

In 5 to 6 months time by a Managing Proprietor about to sell property, an appointment as Superintendent of a Tea Estate or a large tea house preferred. Mincing Lane and Assam experience. Command of Labour.

Apply T.,

C/o this paper.

SHORT ADVERTISEMENTS.**NOTICE.**

THE cost to subscribers of short advertisements is One Rupee for every three insertions of five lines or less. To non-subscribers a charge of Two Rupees will be made.

N. B.—Advertisers should state exactly the number of insertions required, failing this the advertisement will continue running until stopped and will be charged for accordingly.

OFFERED.

Coffee Seed extraordinary.

After two years' careful investigation I have been able (by a process which I shall not, for obvious reasons, divulge) to produce a coffee seed containing the very excellent percentage of 7 per cent. of ash with the parchment, and 3.71 without, as compared with 2.6 per cent. of ash with and without parchment of the ordinary seed. The analysis was made by Mr D. Hooper, of Ootacamund. Price Rupees Fifty per bushel, cash with order.

L. W. GREY,

u. c.

Pykara, Nilgiris.

Wooden Bungalow, &c. FOR SALE.—A wooden bungalow containing a quantity of weather boarding, rafters, door frames, window frames, doors, windows, &c.
Two Iron water-wheels. A quantity of powdered sulphur.
A cash chest.

u. c. Apply P. GUARD,
Cherambadi P. O., Wynaad.

Attakhan Cadoo Estate. FOR SALE.—Attakhan Cadoo Estate, Coffee 100 acres, Jungle 87.

u. c. Apply L. A. WAUGH,
Verurajendrapett, L. Coorg.

Camera, &c. FOR SALE.—One time and instantaneous Hand Camera, R. R. lens, and complete outfit, almost new.

One 450 bore G. A. Pistol in case with implements.
One large Shikar knife.
One lady's saddle with Scott's patent safety stirrup.
Everything in perfect order.

u. c. Apply "B B B" C/o Manager.

Rifle. FOR SALE.—450 Express, mail canvas case, re loading and re-sizing Tools and some ammunition. In perfect order.

u. c. Apply 303, MANAGER, *Planting Opinion.*

THE LABORATORY,

OOTACAMUND,

D. HOOPER, F.C.S., F.I.C., *February 20th, 1896.*

Quinologist to the Government of Madras.

A. BROWN, Esq.,
Podanur.

Tannery Refuse. This is to certify that I have analysed a sample of "Tannery Refuse," received on the 7th February 1896, and find it to contain

Moisture	...	...	8 80
*Organic matter	...	...	69 84
Lime as carbonate	...	...	9 23
Potash salts	...	...	1 20
Magnesia, &c...	...	...	2 47
Sand	...	...	8 46
			100 00

*Containing nitrogen ... 3 43
[Equal to ammonia ... 4 83]

This analysis of "Tannery Refuse" shows a great improvement on samples called by this name that have passed through my hands. The ammonia is much higher than it was in the last specimen, and the mineral constituents are well distributed. I consider this substance a very useful fertiliser.

D. HOOPER.

Price Rs. 20 per ton delivered in neat bags in Calicut, and slightly cheaper at Mettapalayam.
Two.

Boys' Own Paper.

Five Vols. "Boys' Own Paper" (1889-94), in good order. Price Rs. 20; offered considered.

u. c.

Apply XNAW., C/o EDITOR.

Sturdy Pony.

FOR SALE.—Handsome bay Persian pony cob, sturdy and well bred, 4 years 13-3, believed sound. A superb saddle nag, with snaffle mouth and if trained to harness would make a grand trapper. Price Rs. 500.

Three.

Apply "DANDY DICK,"
C/o Manager of this Paper.

To Small Capital-list.

FOR SALE Rs. 6,000.—A newly-built brick Mangalore Tiled Bungalow, in about 50 acres of land, suitable for fruit growing or coffee cultivation under shade. Rainfall 80 inches. Only 3 miles from Taluk Headquarters, Govt. Dispensary and Post and Telegraph Office. A good road leading to bungalow only ½ mile off Government Road.

Apply sharp BUNGALOW, EDITOR, "Planting Opinion," Coonoor.

Bangalore Orchard.

FOR SALE £500 STERLING.—An orchard in good order within Civil and Military Station, Bangalore, S. India, in a seven-acre block. Water available; containing a nice strongly-built 8-roomed Cottage, with large outhouses and stabling for 3 horses.

Estimated annual rental value £18. Fruit and other crop returns £18 per annum.

Further particulars, apply

English Education.

The Rev. Frank R. Burrows, M. A. Trinity College, Oxford, receives Boys to prepare for Public Schools and Royal Navy. Ages 7 to 14. High and healthy situation, home comforts. Terms 50 to 70 guineas per annum. References kindly permitted to, and particulars to be had from, C. A. Martin Esq., LL D., Darjeeling, and Lt.-Col. G. C. Dobbs, I.S.C., Commissary-General, Bengal Command, Naini Tal.

There are so many cheap imitations of Ellwood's helmets in the market that it is a comfort to know that
PHELPS & CO. keep Ellwood's only.

including the cost of carriage to the estate. How's that for cheap?

A correction.

In our last issue we published an extract from the *Nilgiri News* under the heading of "Fibre in the Wynaad," stating that Mr. H. Punnett was making extensive arrangements for planting sisal hemp at Pundalur, on behalf of an English Company. This, we learn, is utterly without foundation, and we much regret having given currency to the report.

The United Association.

We have to acknowledge with thanks a copy of the third Annual Report of the Proceedings of the United Planters' Association of Southern India. Like its predecessors it is excellently got up, while a clear and useful index affords ready reference to the many subjects of interest contained therein. The whole book reflects much credit on the new Secretary, Mr. Ormerod. Some useful tables of statistics, to which we refer elsewhere, form a new and very welcome departure.

Nilgiri cinchona.

Our worthy contemporary, the *Nilgiri News*, seems to have gone slightly astray in a recent note on the cinchona bark off Devashola estate. An esteemed correspondent, in drawing our attention to the matter, says: "I see in the *Nilgiri News* a para. stating that some Deva Sholah bark recently gave 6% (of quinine) by analysis. In the first place such a yield must be incorrect. And the value which is stated to be 5½ as. per lb. at present market price is incorrect. At ½d. per unit it would only be worth 3d. per lb., which would be a fraction over 3 as. You might point out this mistake, which is misleading."

Thatch-grasses.

In our issue of December 19th we gave an interesting extract on Thatch-grasses, which omitted, however, mentioning the very essential detail of thoroughly treading out and drying the grasses before thatching. Another point, says a correspondent to a contemporary, is that it should be cut as near the ground as possible, and all ferns, creepers, etc., should be cleared out of the grass. Carefully cut at the proper time, and the works of treatment and thatching well and carefully done, the result should be a thatch that will last for years.

Flies on cattle.

The following remedy is given in the *Scientific American* for flies on cattle: Coal tar one part, oil and grease one part each; mix with a small amount of carbolic acid. Apply with a cloth, and it will drive off every fly, and last ten days or more in dry weather. Any kind of old lard or grease can be used. This remedy is equally effective as a lice exterminator on poultry, and is used for painting the sides and roosts of the fowl-house. For a hen and young chickens saturate a cloth and place it in the bottom of a box, and put the hen and chickens in the box for an hour or so.

Kola.

There is just now quite a boom in this valuable product, not in price, but in popularity for planting. Brazil, Ecuador and British Guiana planters are determined to give it a thorough trial. The crop, it must be remembered, is a very clean and simple one to handle. Nothing beyond picking and curing is wanted, the nut is just packed in kola leaves and

shipped right off. No pulping, curing or manufacture of any kind. The great obstacle to the "million" cultivating a taste for kola has been the want of a palatable preparation which might be taken instead of tea or coffee. This Mr. Thos. Christy claims has been done by his "neo-kola," and foresees a time when coffee and tea will have a powerful rival in kola.

The Annamalais.

We publish elsewhere a recent G. O. on the opening of this district, which is most satisfactory as showing the thoroughly sympathetic attitude of the present Government towards the planting industry. It will be noted that the chief points of interest are as follows:—That the enhanced rate of Rs. 2 per acre will only apply to half instead of four-fifths of the holding. That an extension up to the 31st of March is allowed the original applicants to complete their selections. That the main road will be constructed as soon as ever it is possible and that the trace of the road shall be published. And lastly that only plantation products, such as coffee, tea, cocoa or cinchona, may be planted.

Indian coolies for America.

A Ceylon planter, Mr. Maitland-Kirwan, who has considerable planting interests elsewhere than in the Island; on behalf of various states in Central America (including Honduras, where he represents a new and large coffee interest) will pay a visit to the authorities in Calcutta for the supply of Indian coolies. In times of famine like the present, the good resulting from emigration is undoubtedly immense, and we heartily wish Mr. Kirwan all success. The demand for cheap labour in South America is practically unlimited, but it is altogether another question whether the individual States will be able to guarantee that treatment which the Government of India very rightly demands.

New commercial plants.

All planters and horticulturists in India who are enterprising enough to experiment in new products, will find a good list of plants to select from in Messrs. William Brothers' catalogue for 1896-97. As frontispiece a coloured illustration of a wonderful 12 fruited pine apple is shown, and within is a list of very nearly every plant suited for tropical agriculture. In most cases there is in addition a paragraph or more to each different product, giving useful information of all sorts. We propose printing a few extracts in a future issue for the benefit of our readers, though it will only take a 3 pie postcard to obtain the catalogue itself from William and Co, Heneratgoda, Ceylon.

The Papaw Carrica Papaya.

No. 31 of 1896 of the *Agricultural Ledger* Series contains some interesting information on the digestive qualities of the juice of this plant. Briefly it may be said that the medical profession look upon it with scant favour, as careful tests seem to have established its inferiority compared to pepsin, its older rival. This is confirmed by a London Market Report we noticed recently stating that the demand for papain (the vegetable digestive ferment of the papaw) is strictly limited, and that but little enquiry is shown for the article. The Continental

trade is brisker. The writer in the *Agricultural Ledger*, however, does not fail to point out that as pepsin, being an animal ferment, cannot be generally used for the Natives of India, it is quite possible that the vegetable papain might be of extreme use in this country for all diseases where an artificial ferment is deemed necessary.

The Ganjam labour district.

In obtaining labour for Native States from the neighbouring districts, there is a constant and very real danger of their deserting *en bloc* at the first opportunity. Why not try going a little further afield, and getting the labour from such a distance as would deter them from making their way back without their expenses being paid and some sort of protection given them *en route*? Now take Ganjam. This district is largely visited by Assam planters and their contractors, the labour traffic being large and constant, both "free" and indentured. Recruitment is easy enough of course, but the chief difficulty lies in transportation. Probably the most satisfactory of all means would be to ship on a coasting steamer and land them on the West Coast. Being then in a strange land, marching them up the ghats would be no very difficult matter, and once on the estate few would care to risk the loss of their passage back to their homes by the chance of a successful desertion. If agreements could be made with each individual cooly for, say, a couple of years work, some success might be achieved this way, and the expense would not be greater than at present.

The Assam famine.

The famine in this district was thought at first to have its bright side for planters, in the matter of inducing a larger supply of labourers to come forward than usual. In spite, however, of the very grave scarcity both in Assam itself and in those districts of the Central and North-West Provinces, whence a large proportion of its indentured labour comes from, so far there has been very little observed of the expected movement. On the other hand there has already commenced that serious loss on rice, which grain planters under the special labour laws in force are bound to supply at a fixed minimum price. This provision of a benevolent Government is undoubtedly a wise one in the interests of the labourers, but acts with peculiar hardships on their employers. In good years, when rates of grain are cheaper than the price planters are prepared to sell, coolies naturally obtain their supplies elsewhere. Hence in good seasons there is always a certain loss owing to a proportion of the stored rice going bad. In times of scarcity there is, on the other hand, a tremendous rush on the plantation grain-godowns, and the planter of course suffers a heavy loss in being forced to buy in a dear market and to sell in a cheap one.

Kerosine as an insecticide.

Professor H. E. Weed, writing of the value of kerosine for insect-infected plants, says that it can be used against all insects except those living in confined places where they cannot be reached, such as tomato worms, those living in stored grain, etc. The amount of kerosine which should be used will vary with the kind of insect to be treated, some requiring a much larger proportion than others.

Nearly all plants will bear one part of kerosine to ten of water, but when a stronger application is to be made, it should first be tested on a few plants to see if the foliage is affected. For the treatment of ordinary insects the following proportions are recommended: Plant-lice of all kind, 1-20. Caterpillars or other larvæ exposed on leaves, 1-15. Scale insects on leaves, 1-10. Scale insects on bark, summer treatment, 2-10. Scale insects on bark, winter treatment, 3-10. Lice on domestic animals, except hogs, 3-10. Lice on hogs and ticks on cattle, 5-10. The mixing of the two liquids takes place partially in the pump, but more largely in the nozzle, where they are divided into very fine particles. Of course a mixture made in this way is not a permanent one, nor is it necessary that it should be so. What is needed is simply a dilution of the kerosine, so that it will not cause injury when applied, and the attachment accomplishes this object fully.

Fresh versus old manure.

From the interesting note below it will be seen that it is far more economical to apply cattle manure in its fresh state, than to wait until it is in its "best condition," or as planters put it more graphically, till "it cuts like butter." Over a half of the money value of the manure is wholly lost, if application is delayed. Unfortunately, however, unless the present deep pit system is given up the loss from the fermentation of the fresh manure would counterbalance a large part of the gain; and added to this there is the extra expense perhaps of weeding, due to the seeds not being killed. If we might suggest a method that could be perhaps safely and advantageously tried on steep land, we would advise broadcasting the manure round the trees, and covering lightly with earth. This again necessitates extra care in drainage to prevent wash:—

As the result of experimental tests made at Ottawa Experimental Farms (Canada) last year, it was shown that 8,000lbs. of cow and horse manure (equal quantities of each), placed under shelter from rain and turned and weighed once a month, was reduced in weight between March and December to 2,600lbs.; at the end of four months it was in "best condition," and weighed 3,480lbs. During eight years of experiments on crops it appears that the action of fresh manure on crops is equal, ton for ton, to that of rotted manure. This bears out the opinions of several farmers that it would be most economical to cast out and plough under lightly all manure as soon as made. The objection to this would be that the field would be fouled with undigested seeds.

The trade of Ceylon.

The following figures from the local *Observer* regarding the trade of Ceylon will be of interest. Dessicated cocoanut, though not shown in the list, is a staple of increasing importance, the increase over last year's exports being as much as 300%.

The coffee crop on the other hand was three times smaller than last year's, while tea shows an increase of nearly 10½ millions, roughly 10%.

	1896	1895	Increase or decrease.
Tea lb.	108,141,412	97,939,871	10,201,541 in
Coffee cwt.	22,747	63,920	41,173 de
Cocoa cwt.	31,366	27,420	3,946 in
Cinchona lb.	1,309,560	921,085	388,475 in
Cardamoms lb.	452,595	374,635	77,960 in
Cocoanut oil cwt.	343,497	384,140	40,343 de
Plumbago cwt.	340,491	334,921	5,571 in

They have no pretensions to cheapness, nor do they advance any such claims, but PHELPS & C understand their business.

A Level. FOR SALE.—A level by Troughton and Simms, in case, with tripod and levelling staves. Complete and in good order. Price Rs. 300. Open to a reasonable offer.

Five. Apply "AJAX,"
C/o EDITOR, *Planting Opinion*.

Coffee Estate. FOR SALE.—A valuable Coffee Estate, in a good district, 100 acres in bearing, 25 young, 55 acres now being opened, 300 acres forest.

u.c. Apply EL. L.,
C/o Editor.

Tea land, &c. Tea land at high elevation, also coffee land, for sale, or partnership to open. Particulars to

MONOGRAM, CREST OR ADDRESS DIES,
ENGRAVING OF ANY DESCRIPTION.

ADDISON & CO., MADRAS.

There are firms who are unscrupulous enough to advertise their Tailoring at cost price, but
PHELPS & CO. don't.

ESTATE REQUISITES.

ck. Approximate Analyses of these can be had on application.

Quotations will be obtained and orders booked for Basic Slag or Phosphate, Kainit Salts, Muriate of Potash, Nitrate of Potash, Sulphate Potash, Saltpetre, Superphosphates of Lime, 15% Phosphoric Acid, Superphosphates 40%, Soluble Phosphates, and any other Manures not kept stock. Approximate Analyses of these can be had on application.

As to the distribution of our great staple, *tea*, we have the following main facts:—

	In 1896.	1895.	Increase.
	lb.	lb.	lb.
United Kingdom	93,936,361	85,753,339	8,183,022
Australasia	11,062,832	9,379,561	1,683,271
America	718,600	398,527	325,073
Rest of World	2,423,619	2,413,444	10,175

The great increase has been to the United Kingdom; but nearly 1½ million lb. additional to the Australasian Colonies is very good, and also the 325,000 lb. of increase to America, although, of course, a good deal re-exported from London, should be these added to figures.

Basic slag.

Some time ago a valued correspondent asserted that the cost of this "permanent manure" was such as to render it unable to compete with other phosphatic manures, such as bones or superphosphates. We presume that the valuation was based on its percentage of phosphoric acid, but it appears that this by no means wholly represents its manurial value. The lime it contains, according to Mr. F. J. Lloyd, a well-known analytical chemist, is in such a form as do great service in rendering soluble inert forms of soil nitrogen. It is on this that depends its principal value as a manure, unlike superphosphate. This difference may account for variations in comparative trials of superphosphate and basic slag, which have often puzzled observers by their apparent contradictions. Where there is plenty of nitrogen in a soil in a form fit for plants, superphosphate is usually more efficacious than basic slag; but if there be a deficiency of available nitrogen the converse result is likely to be shown. If this theory be proved beyond dispute it will follow that slag must be regarded as a nitrogen-exhausting manure when used freely without any nitrogenous accompaniment. A French chemist, whose remarks on the subject, received by Mr. Lloyd since he broached it recently at a meeting of the London Farmers' Club, has made some experiments to determine the question, and he states that he found that slag converted the inert nitrogen in humus (organic matter in the soil) first into ammonia and next into nitrates, in which forms it is readily assimilable by plants.

Jadoo fibre.

Colonel Halford Thompson writes to the *Madras Mail* under date the 24th December:—My attention has been called to a letter signed "Toda" which appeared recently in the *Madras Mail*, upon the use of Jadoo Fibre for Coffee Plantations. The writer appears to have got hopelessly confused in his calculations from the fact that three separate and distinct uses are mentioned in the Jadoo circular as applicable to coffee growing, and he has taken the quantity of Jadoo required for a seed bed large enough to raise 450 seedlings at a time, (but which could be used again and again so that 20,000 seedlings could be raised from it,) as the basis of a calculation based upon the original 450 seedlings being the whole quantity that could be raised out of that amount of Jadoo. It is needless to say that this calculation is utterly incorrect, though not so incorrect as another calculation, where he takes the amount of Jadoo recommended for encouraging fresh roots in old trees, which once put down would retain its effect for years, as the basis of an argument by which he attempts to prove that "supplies" of Jadoo would cost 9 annas per plant.

Perhaps, however, the better way will be for me to state

to the best of my ability what the cost of using Jadoo Fibre really would be; and for this purpose I will take the cost delivered at the coffee estate at the same figure as given by "Toda," viz., Rs. 170 a ton, though it is difficult to conceive how £7-10-0 per ton at Madras (now reduced to £7) could by any means swell to Rs. 170. However, taking it at Rs. 170, the amount of Jadoo required for raising seedlings in beds to supply 50 acres would be certainly not more than 5 cwt. and would therefore cost Rs. 42-8 instead of Rs. 1,650, as calculated by "Toda"; and this could probably be reduced one-half by using mixed Jadoo and earth for the seed bed. On transplanting from the seed bed, whether the seedlings be put into a basket or transplanted to ground prepared with Jadoo, the quantity used would be the same, viz., one ton of Jadoo would raise 3,640 coffee plants or thereabouts.

This calculation, which has been worked out from figures supplied by Mr. Pilkington of Koppa Estate, Kadur, and checked by him, is on the basis of half filling the baskets when they are used (putting the Jadoo at the bottom) or putting it at the bottom of the trench if baskets are not used. This would therefore cost about 9 pies for each plant, instead of 9 annas as calculated by "Toda." In point of fact he has just multiplied the cost by 12. It will be a great advantage to the growth of the plant if when permanently planting it out, a small quantity of Jadoo be put at the bottom of the hole in which it is planted, but as this is not absolutely necessary, I shall not here go into the cost of doing this.

One word in conclusion as to the advantages of using Jadoo (which is in no sense a *forcing* medium, as "Toda" seems to think). The result of using Jadoo as described above is an increase of fibrous root action, forming a strong healthy plant, which will stand the vicissitudes of climate much better than others not grown in it; and it is for this reason that many tons of it are now being sent to France to "grow on" the young vines. Were it in any way to "force" the plants grown in it, it would be useless for the purpose. It is only fair to "Toda" to say that he has evidently been misled by the wording of the first circular issued in Madras, which I confess was not as clear as it might have been.

EXPERIMENTAL GARDENS.

(Communicated.)

THERE are many such gardens in India. But the existing ones are widely scattered, in addition to having special or local functions to fulfil. In our opinion, therefore, there is still ample room for the formation of new gardens, especially of the class referred to in the heading of this paper.

Starting with the Royal Botanic Gardens of Calcutta, which are purely botanical and scientific, there are many public gardens distributed over the land, possessing mixed or special functions, bearing on the science and practice of horticulture, teaching of botany, acclimatization of plants, experimental cultivation and not infrequently the general improvement of sanitation and public taste.

Such gardens are maintained in India by the Imperial

PHELPS & CO. rely on excellence of workmanship and good taste in building up the biggest Tailoring trade in India.

Government, Native States, Societies, Municipalities, communities, companies and even private individuals, so that there can be no question as to their utility for the public good. It is admitted, therefore, that the existing gardens of the country are mostly doing excellent work within their respective spheres, while a few of them have carried their influence far beyond the limits of this land.

But except the Calcutta institution, which is the oldest and best supported in the country, the formations of nearly all the other gardens, in whatever locality or however maintained, are of a more or less mixed nature. Most of the Government gardens, as also the gardens of Agri-Horticultural Societies, are of a pseudo-botanical character. But it is well known that the work chiefly done by them is horticultural, decorative, experimental and commercial.

In one or two instances, in the north, these gardens may be said to be wholly commercial, to the extinction of private enterprize in the localities where they are placed. Under the assumption of carrying on useful experiments, the Government affects to be justified in maintaining a few institutions of this class, even at the risk of handicapping free trade! This is on a par with what is done in jails, and it appears to us that Government would do well to relinquish such monopolies in favor of private enterprizes. Some of the gardens in Native States are well equipped, and spread their useful influence far and wide. Nursery and market gardens are rapidly increasing in some parts of the country, which is a healthy sign. But at present there is a dearth of purely experimental gardens, worked independently of the Government lines. It is with special reference to the latter class of institutions that we venture to offer a few suggestions.

With rapidly improving facilities for easy export by land and water, the commercial aspect of India is daily improving, therefore anything which is calculated to increase or improve the natural products of the country should arrest earnest attention. In this connection we have said before, and here repeat the assertion, that the Arabian coffee-bean is capable of much improvement. But this desirable result is not likely to be brought about until the whole treatment of the species is conducted on a more scientific and methodical basis than at present, and by the formation of one or more experimental gardens for this and kindred objects.

There can be no question as to who should take the lead in a work of this kind. It is the proper work of Planters' Associations, and in this part of the country the United Association of Southern India should certainly take the lead. Being of a purely experimental nature, mostly with a remunerative product in a suitable locality, such a garden could easily be made more than self-supporting. For example, half the land allotted for experiment could be cropped with coffee in the usual manner, the proceeds from the latter being utilised to cover outlay on the experimental plot also. But should the remunerative portion be found to interfere with the experimental work in an adjoining field, which is very probable, it should be isolated from the latter. Another plan for maintaining an experimental garden would be to levy a small annual contribution on the actual outturn of each estate. By raising such a fund, the Association would possibly have fuller control in

administering the scheme, the details of which might be left to a Select Committee. The persons who would have executive charge of the garden should not only possess special qualifications for experimental work in connection with the growth and crossing of plants, but they should also be expected to cooperate with other experts who are in a position to help in a scientific work aiming at the improvement of natural products such as tea and coffee.

We would not advocate a large garden, but it should be well placed and fully equipped for carrying on experiments with delicacy and judgment. The performance, as also the registering of experiments, would require to be entirely in the hands of a few trustworthy Europeans, presumably planters who are thoroughly versed in such work, assisted by a skilled gardener. Fifty acres of land, supervised by such a staff, and having a small permanent establishment of coolies for rough work, would be ample at first. Gentlemen of the Executive Committee who are ballotted to act as visitors to the garden and advisers in the management, would not expect to be paid a salary for services rendered to the whole planting interest. But it is only right that a yearly bonus should be allowed in such cases, if only to meet travelling and other incidental expenses.

It is difficult to state even the approximate cost of such a garden until it has been fairly started. But for an area of fifty acres, the annual cost of maintenance might be roughly estimated as follows:—

*Estimate for working an experimental garden of 50 acres
for the improvement of coffee and allied products.*

	per annum.
1. Wages of a whole time European gardener @ Rs. 200 per mensem	Rs. 2,400
2. Bonuses to 3 members of the Executive Committee who would visit the garden and give personal help @ Rs. 600 each	1,800
3. Office charges with clerk	500
4. Permanent labour including draught cattle	2,400
5. Manures	1,000
6. Contingencies	400
Total	Rs. 8,500

PRUNINGS AND DISEASE GERMS.

THE subject, "Finger and Toe in Turnips," of the extract we give below from a home paper may at first sight appear to be of little interest to us, the connection between diseased turnips and unhealthy plantation products not being very obvious. Yet a little thought will clearly establish the similarity of the two cases. In coffee and tea, the prunings are allowed to either rot on the ground, or else are buried in branches or pits on the field, and with coffee moreover the pulp itself is very generally if not invariably used to supplement the usually scanty supplies of bulk. The disease germs and pupæ of insect blights find a natural resting place in such matter, and with coffee pulp especially is this likely to be the case. Allowing this disease laden matter to either remain among the trees, or to be specially carried back again, is in all probability therefore simply encouraging a recurrence of the disease. In the case of the turnips instanced below, it was clearly proved that the scrapings of *even sound* turnips applied to the soil as a manure for a succeeding crop of roots, had an extraordinary effect in producing the dreaded

Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} — for payment of death claims.

On Policies transferred to the London Register, death claims will be paid in England at the current exchange ^{or} on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Drafts on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to only Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesday and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

disease in an otherwise healthy crop. In bringing the matter to the notice of his brother planters, Mr. James Westland of Ceylon goes so far as to say that in the old coffee days of 1871, he remembers well that the fields manured with coffee pulp, in conjunction with pig manure and bone dust, were the first to go when attacked by leaf disease. We ourselves have noticed in one or two cases that the coffee adjoining the pulp house usually seemed to be suffering more acutely from leaf than fields some distance off.

This is clearly a matter of the greatest importance, and is well worthy of scientific investigation. We would suggest that the first step be to send samples of coffee pulp in various stages of decomposition either to Dr. Watts, Reporter on Economical Products to the Government of India, Calcutta, or to Mr. Cotes, of the Calcutta Museum. A microscopical examination would soon reveal the presence of the disease germs, if existent. The next step, if as we strongly suspect the germs were discovered to be present, would be to discover the best methods of destroying them, either by burning the pulp by means of a cheaply built brick incinerator, which we consider the most perfect method, or by some other perhaps equally satisfactory manner by which the valuable humus might be preserved.

With regard to the pruning either of tea or of coffee, we do not think there need be any investigation at all, the matter being so very clear. As soon as a field is pruned, before the leaves have even begun to dry, the prunings should be diligently collected and burnt. It will be objected that we have not taken into account the dead and presumably disease-laden leaves that fall to the ground every day of the year. Surely these also, exclaim the dissentients, should be removed and burnt, or otherwise how can the disease be done away with? As this is manifestly impossible, they conclude there is no use in bothering about the matter at all. But we do not claim that our methods are perfect, nor that diseases will thereby be extirpated. Yet that the severity of their attacks will be greatly reduced, we think is more than probable. We only advocate the practical, and it is ridiculous to condemn a system because it does not attain theoretical perfection. Cultivation and manuring of all kinds would be condemned on the same grounds, for though they do some good, they might do a great deal more.

A final objection, and a very practical one, is the one of cost. Will such methods pay? Well, considering that in both coffee and tea expense of collection and burning would certainly not exceed five rupees per acre per annum, it is obvious that a very small increase of crop would repay such outlay. On the other hand there is the loss of humus which would result from the decay of the prunings on, or in, the soil. We have always been such staunch upholders of the doctrine of preserving humus in every possible way, that it goes somewhat against the grain to have to dismiss this objection summarily. Plant food is a very good thing, but if such food be diseased and unsound, it is wiser far to destroy it. There is an extraordinary similarity between the various functions of animal and plant life. Though the dangers of reasoning by analogy are very great, yet in nine cases out of ten it may be taken for granted that we are perfectly safe in applying the broad laws that govern animal life to the vegetable kingdom.

But why should the prunings be wasted altogether? It may well be possible that some use may be made thereof, that is as far as the leaves are concerned. Taking coffee, which is the most unpromising of the two, first. Coffee leaves contain an appreciable amount of caffein, for which there is a large demand at home. Though we do not dream of suggesting that caffein factories be established in the coffee districts, yet there are, we believe, very simple methods extant of preparing decoction of the leaves. This extract, which might be dried to further reduce bulk, could be sent home cheaply enough. At all events, the subject is well worthy of investigation. With regard to tea, concentrated decoctions of theine might similarly be prepared. Better still would it be to try and manufacture a rough grade of tea, suitable for consumption by the natives of India. The majority of the leaf being hard and brittle, it would be naturally impossible to effect anything approaching a wither, and rolling would be more in the nature of crushing into powder than anything else. Yet a liberal application of water might help matters somewhat, and a species of fermentation set up. We venture to say that such tea would find a ready market at a figure considerably over the cost of production.

Interesting as this subject undoubtedly is, it is straying from our subject, and we will finally allow our readers to peruse the extract on which the above somewhat lengthy remarks are based:—

FINGER-AND-TOE IN TURNIPS:

A DISCOVERY.

(*Aberdeen Free Press*, 27th Nov.)

What seems to be rather an important fact for agriculturists has just been brought to light by Mr. William Sim, naturalist, Fyvie. It deals with finger-and-toe in turnips. About a year ago Mr. Sim's attention was drawn by a neighbouring farmer to a rather remarkable case of cankered roots. Across a field of perfectly healthy bulbs was a wide strip of very diseased turnips. On inquiry it was found that when the field had been in lea, three years previously, several cart-loads of scrapings and refuse of the turnip shed had been spread over the lea as top dressing. At the same time, Mr. Sim discovered that a turnip drill which he had himself laid down under ordinary conditions for experimental purposes on land which had not grown turnips for 25 years, showed grave symptoms of finger-and-toe. He discovered that this experimental drill had been manured with a compost containing turnip refuse. Putting the two cases together, Mr. Sim came to the conclusion that the disease was caused by the presence in the soil of turnip refuse. Now, it has long been known to farmers that the refuse of cankered roots was highly dangerous to the new crop, but it had never been taught that the turnip remains of even sound roots were a source of grave danger as well. Mr. Sim determined to put the matter to a practical test. He laid down two drills 30 inches apart, in carefully prepared soil. The first drill got the usual allowance of farmyard dung and ordinary turnip manure as sold at manure stores. The second drill received the same quantity of artificial manure, and a rich compost of turnip scrapings. The results are astounding. In the first drill 94 per cent. are splendid roots and the remainder diseased, while in the other drill the results are simply reversed, there being only five sound but very small roots in the hundred. The diseased turnips, moreover, were almost entirely useless and the remainder following fast. The presence of diseased bulbs in the first drill is evidently the result of their proximity to the noxious influence of the diseased root fibres, and had the distance between the two drills been increased, there is no doubt the first drill might have been entirely free from disease. To obviate the evils arising from the use of turnip refuse, Mr. Sim is of opinion that this refuse should be carried back to the turnip field and there laid down to be exposed to the frosts of winter and the heat of summer for five

It is so well-known now that Messrs. PHELPS & CO.'s prices, notwithstanding that they are considered high, are so much below those of London, that their trade is advancing by leaps and bounds.

or six years (presuming, of course, a six or seven course rotation) until the dreaded germ has been destroyed.

THE ANNAMALAIS.

GOVERNMENT has passed the following Orders on the grant of lands for coffee cultivation on the Annamalais:—

In paragraph 5 of its Proceedings, No. 466A., dated the 3rd October, 1896, the Board urges the desirability of restricting the imposition of the enhanced rate of assessment of Rs. 2 per acre to one-half instead of four-fifths of the holding on the ground that the Orders already issued are likely to act as a stimulus towards over-clearing, the effect of which might in the Board's opinion be most disastrous. A similar modification is suggested by Messrs. Binny and Co. and the Hon'ble Mr. Hodgson. Messrs. Binny and Co., however, urge that the percentage upon which the enhanced rate is leviable should be calculated upon the land available for coffee within the holding instead of upon the whole area. As the Board points out, the adoption of this course might lead to controversies as to the extent actually cultivable with coffee. The Government therefore considers it preferable to accept the Board's recommendation in the matter and resolves in supersession of its previous Orders to direct that the enhanced rate of assessment of Rs. 2 per acre shall not be imposed upon more than 50 per cent. of each holding unless a larger proportion is actually cleared, in which case the whole amount so cleared will be chargeable with the enhanced rate. Subject to this modification, the periods within which the enhanced rate will be chargeable upon fixed proportions of the holding will remain unchanged.

In paragraph 6 of the same Proceedings the Board points out that the special list of valuable trees previously submitted to Government will not necessarily be suitable for adoption in view of the Orders contained in G. O. No. 485, Revenue, dated the 28th September, 1896. The Government will be ready to consider any recommendations which the Board may submit for the alteration of the list.

In Board's Proceedings, No. 494, dated the 23rd October, 1896, the Board concurring with the Collector recommends an extension up to the 31st of March, 1897, of the time within which selections may be made by the original applicants. For similar reasons, Messrs. Binny and Co. request an extension. The concession will be granted and the Board will be requested to intimate the fact to other applicants than Messrs. Binny and Co.

The Board has correctly interpreted paragraph 4 of G. O., No. 495, Revenue, dated 28th September 1896. It was not intended to permit cultivation of all kinds but only of plantation products, such as coffee, tea, cocoa and cinchona.

The fresh applications for land received by the Collector during the period 29th June, 1896, to 21st August, 1896, may be treated in the same manner as those mentioned in Board's Proceedings, No. 280, dated the 4th July, 1896.

The question of the direction of the main road which is designed to open up the Annamalais must be left to the Collector and his District Forest-officer who should in communication with the Public Works Officer in charge of the road arrange, as far as possible, to adopt the most convenient line. The Collector should bear in mind that the object in view is the construction of a main road along the trace which is most suitable, having regard on the one hand to the difficulties of making a road and on the other to the desirability of taking it through the heart of the country to

be opened up. The tracing and construction of the road are matters to which Government attaches great importance and must be carried out with as much expedition as possible. The special attention of the Public Works Department and of the Collector will be drawn to this matter, but the Government cannot give any positive assurance as to the date within which the road will be completed as requested by the Hon'ble Mr. Hodgson in his letter, dated the 20th October, 1896. The Government accepts the Collector's suggestion that a penalty should be imposed on the lessee if he fails to clear his boundary within six months of the issue of the lease or within three months of notice being given by the Collector.

With reference to paragraph 9 of the Collector's letter No. 280, dated the 21st October, 1896, it should be made clear that the lessee is merely entitled to the use of the minor forest produce and that its collection for trade purposes shall continue to vest in the Forest Department through the agency of Kiders and other hill tribes.

With reference to paragraph 11 of the same letter a provision should be inserted in the draft standing order empowering the Collector to reject any application if, for special reasons, he considers it inexpedient to give the land applied for on lease.

The Government agrees with the Board in considering that it is desirable to omit at least for the present the requirement that a notice regarding the sale of land should be posted on the land itself and that it is inadvisable to adopt the Collector's suggestion that each applicant should cut a rough boundary round the land for which he applies before it is put up for auction.

With reference to paragraph 14 of the Collector's letter Government considers that it should be expressly stated in the Standing Order that an application not withdrawn amounts to a bid for the land at the upset price of Rs. 5 per acre.

In paragraph 2 of their letter, Messrs. Binny and Co. ask for some assurance that the main road or branches traced out by Government will touch all the plots of land that may be applied for, or that the trace of the road should be published at once. The Board proposes to publish the trace, but subject to the proviso that it may be deviated from as the work proceeds and this proposal meets with the approval of Government. Messrs. Binny and Co. further suggest that the lessee should be permitted to relinquish not less than one-half of his holding. The Government agrees with the Board in considering that there is no necessity to provide for partial relinquishments now that the proportion ordinarily assessable with the enhanced rate of Rs. 2 per acre has been reduced to 50 per cent.

The Hon'ble Mr. Hodgson urges that a clause should be inserted in the form of lease reserving to Government the right to grant permission to any lessee to cut a cart-road through any of the leased lands to connect his holding with the main or one of the principal branch roads, the Collector being empowered in case of dispute to decide whether such road is necessary or not. This suggestion commends itself to Government. The question of the payment of compensation to the lessee through whose holding such a road is constructed is one which must be decided as the circumstances of each particular case may require.

Mr. Hodgson further points out that, when an unopened portion of a holding is resumed, the resumption is, under the orders already issued, subject merely to the refund without interest of the assessment paid on such portion; but as Mr. Hodgson remarks it is only equitable that the purchase money

PHELPS & CO. have often been asked why they don't open a branch in Darjeeling, but for that matter they have been pressing for years past to open at Bangalore, Coonoor, Madras, Rangoon, Lucknow, Cawnpore, Delhi, Mussoorie, and even in Nainital but they prefer doing business from their Head Establishment, where the Managing Proprietor can have everything under his personal supervision, and travellers are employed to visit everywhere.

SEEDS AND PLANTS OF COMMERCIAL PRODUCTS.

Tea, Assam Hybrid and Indigenous of high class jats, China Tea, Cacao, best Forastero Trinidad varieties, Sterculia Acuminata (Kola nut), true superior variety, Hevea Brasiliensis (Para Rubber), True Maragogipe, Liberian and Arabian Coffee, Nutmeg, Clove, Cinnamon, Cardamom, Vanilla Planifolia (true Mexican variety), Erythroxylon Coca (large and small leaved kinds), best Sumatra Tobacco. Mangosteen, Sapodilla, Giant Kew (fruit weigh from 10 to 28 lbs. and over) and twelve fruited Pine Apple, E. Umbrosa, Fourcroya Gigantia, Artocarpus Incisa (seedless Bread Fruit), Arnatto, Kapok, Cocoanut several varieties, Penang Areca nut (large), Landolphia Kirki (African Rubber), Teak and numerous other seeds and plants. Price on application. Boehmeria nivea (Rhea) fresh seed Rs. 5 per ounce (about thirteen hundred plants may be raised to the ounce, or say 20,000 per lb.) Erythrina lithosperma, new crop of seed Rs. 3 per 1,000 post free, cash with order.

Touching a shipment of Indigenous Tea seed, an experienced Indian Planter writes us from Madura District dating 24th June 1896: "Just received the Tea seed; it has arrived in perfect condition, notwithstanding unnecessary delay in transit, and does you credit. Please book me for five maunds as early next May as possible."

SKETCHES OF THE PLANTING DISTRICTS OF SOUTH INDIA.

III.

WYNAAD.

BY ADOLPHUS ARTHUR WRIGHT.

(Concluded from our last.)

South Wynaad.

I shall now relate something of this part of the Wynaad. The oldest plantation (Coffee) by the late G. J. Glasson about the year 1844—the latter also about that time, but I am not aware by whom. In the early part of the year 1848 I visited the Vayitri, and remained with Mr. Glasson for a few months; his plantation was then very flourishing. The old Pookoote, I think, was owned by some firm in Bombay; that part of Vayitri district in the early days was dense jungle and grass. The labour that could be got there to work in the Coffee were Punnears chiefly. There was also an old estate named the “Caroline,” situated at Kalpatty, five miles this side of Vayitri; no roads, except the steep one of old Tippoo Sahib, the Tambracherry Ghaut was one zigzag steep and rocky. At the foot of the ghaut there were two or three large rivers to be crossed before reaching the Tambracherry Travellers’ Bungalow on the way to Calicut. But since the year 1850, many number of Coffee Planters have sprung up. The Tambracherry Ghaut is an excellent ghaut at present with an easy gradient for carts. This ghaut was opened out by Major Kennedy with a party of Sappers and Miners, and completed by other P. W. Department Officers, his successors. The Trunk Road runs through a village named Meppaddy, where there are several grand Coffee and Tea and Cinchona Estates, and also a few pepper vine plantations. Then it goes on through Sultan’s Battery. This is also a large Coffee centre with excellent coffee. And the same road goes on to Vayitri and on to Calicut *via* the Tambracherry Ghaut. Then there are other branch roads kept up by the District Boards of Nilgiris and Malabar, so that there is every convenience at present for the Planters and others. An extensive field was opened out on the “Vellera Mullay Range,” (this is a range of hills running South West from the Vayitri range,) for the Southern India Coffee Company. It was first begun in the year 1854 or so by a Mr. Beaumont. The highest part of the range is six to seven thousand feet. It is situated about twelve miles West of the village Meppaddy. The plantations there at one time were very flourishing, but now have mostly died out, and I believe the Southern India Coffee Company gave up. But there are yet a few good plantations there kept up by individual Planters. Several old plantations on the Vayitri side and Kalpatty have died out, and their place taken by the destructive lantana. I may also mention that a telegraph line runs on from Ootacamund *via* Vayitri and on to Calicut. There is a Signaller’s office in Goodalur and another in Devalla, in Wynaad, the branch of Devalla being the principal, and from where messages may be wired to any part of India. Moolloo Kurrumber, a peculiar tribe of Kurrumber, is something like the Chetty—he wears his “Koodoommey” in front, he cultivates rice and other grain. They are clever shikaris with the bow and arrow. Each Moolloo Kurrumber possesses three or four Pariah dogs, which are trained to hunt, the string of their bow is made of strong gut, the arrow with feathered stem and sharp steel point. These Kurrumbers go out some three or four times in the year on hunting expeditions. The Moolloo Kurrumber also carries with him a few blunt arrows to kill peacocks; this is made of round hard blunt wood at the end—nowadays, these Moolloo Kurrumbers are not allowed to hunt in Government Reserve Forests. They do not hunt the bison nor the tiger; they never use fire arms, though they may sometimes send in a dozen

arrows into a tiger if they do by chance come across the brute. There is a Hospital in Sultan’s Battery and a Tahsildar’s Catcherry in Vayitri; Liberian Coffee also is being grown extensively by European planters, and there are wealthy Nairs and Moplahs in South Wynaad who have extensive coffee plantations.

The climate and soil of Wynaad are favourable to rice, raggi and sammay, but horse gram and wheat won’t grow. Almost all vegetables, English and Native, do well. Plantains, pineapples, peach, oranges, loquots and mangoes grow; the cocoanut palm will grow also, but bears no nuts as it does in the plains. The areca nut palm also will not grow well and bear as it does in the plains. The nutmeg and clove will not grow. The groundnut, too, will not grow well, owing to the destructive white ant.

The Gold Mining enterprise was also carried on in some parts of South Wynaad, but all the miners came to the same sad end, after spending thousands and thousands of pounds of English money; many a planter who eagerly bought up shares rues it to this day. The Provident Gold Mining Company—also in the South East Wynaad—turned out a swindle, I must say; the Directors in London sent out a Manager, and a Mining Captain to work the Reef, but when they arrived, to their sad disappointment and disgust, no Reef could be seen at all; they sunk shafts and tunnels searching for several months for the Reef, but none could be found, and these men swore blue and left the country. Another Company was formed on the strength of favourable report given by *experts*. This was on the slopes of the Koondahs facing the Malabar Earnad Taluq; they named it as the “Walla Walla Wynaad Gold Mining Company.” The Directors sent out from London an old Colonel (I shall not mention his name) as Manager!! This old Colonel of course got a high salary and spent his time merrily. No mining of course, as as there was no auriferous Reef in that part of the country, and so this unfortunate Company died out. One of the many experts who came from Australia called himself “Professor of Gold Mines,” preaching out such grand lectures and prophesying the future of the gold industry in Wynaad. But whoever heard of retired Military gentlemen, such as Colonels and Generals, as Managers of Gold Mines? Mostly all the miners were Cornish men, who really knew nothing about gold mining. A good many of them were given heavily to drink. At times on a Sunday there used to be such fights among them in the liquor shops at Devalla that a special Head Assistant Magistrate had to be appointed by Government in Devalla and Pandalur to keep these drunken ruffians in order. Miners used to be allowed to work as they liked, and they lived more like gentlemen than miners, because their salary was high. The mining companies made another mistake in South East Wynaad; they were not satisfied with the Medical Officer, the Apothecary, appointed by Government in the Devalla Hospital, but they must needs employ a Doctor specially from England, on a high salary of course, erecting a substantial bungalow for him, besides a Hospital and so on.

I shall now end my notes on the Wynaad as I have known it in olden days and at the present time, with the hopes that they may be of use to people who have not been in this part of India.

THE END.

THE “LADYBIRD” AND ITS CRITICS.

WE are very much indebted to Mr. E. E. Green—specially qualified as he is to write with authority on the subject—for the following communication sent by him to our “senior” in England. It will be seen that Mr. Green sees no reason in the adverse criticism recently offered, for refusing to make the experiment proposed of infesting “ladybird” beetles to deal with the green-bug on coffee; but as the expense would be widely distributed, over planters in Mysore, the Straits, &c., if they agreed to join in the employment of Mr. Koebele, it ought not to cost any individual proprietor more than a few rupees. We are back, therefore, at the point where support for a joint mission should be canvassed for—who will lead the way? Mr. Green writes as follows:—

“Budleigh Salterton, Devon, Oct. 8.—I have just been read-

It has been remarked several times that no doubt PHELPS & CO. will raise their prices, now that they have taken their Ladies’ Department to 4, Russell Street, but it is a mistake.

ing in the *Ceylon Observer* (Overland Edition, Sept. 16) an article called 'The Lady-Bird a Humbug,' by an anonymous correspondent.

"There are one or two points in the article that warrant a little criticism. Your correspondent argues from the fact that because 'scale-insects are found in Australia, therefore, the introduction of ladybird beetles from that country must manifestly be useless. This fact does not warrant his position at all. In their own country the lady-birds are hampered by numerous natural parasites that prevent them from multiplying sufficiently to get the upper hand of the prolific bugs. But when the beetles are settled in some other country, having left their parasites behind, they are in a position to multiply unchecked as long as a sufficiency of their food is forthcoming. And this being the scale-bug, the failure of food would mean the success of the ladybird experiment.

"It may be said that other natural enemies will find them out in the new country. And so they will—in time, but experience shows us that it is usually a long time before fresh enemies acquire the habit of preying upon the new introduction.

"There is no question whatever about the value of the work effected by the 'Vedalia Ladybird,' which was imported from this same scale-infested Australia. In a comparatively short time this insect practically freed the orange plantations of California from the dreaded 'flute-scale' (*Icerya purchasi*) that had proved so destructive there.

"The partial failure of the experiment in other places requires an examination of the particulars of the individual cases before we can judge of their merits. It appears—from quotations supplied by your correspondent—that ladybird beetles have not given entire satisfaction when employed against the ravages of the 'black scale' (*Licanium oleæ*). Now this particular bug forms a very hard scale in its later stages which serves as a protection for the large number of eggs deposited beneath it,—a fact which may possibly account for its ability to resist the attacks of the beetle.

"Our own chief pest, the 'green bug' (*Licanium viride*), is an especially unprotected insect, the skin of the body remaining soft to the end. In this particular it very closely resembles the species which we are told by Mr. Kœbele has been exterminated in Honolulu through the agency of ladybird beetles—also originally hailing from Australia.

"Your correspondent very justly suggests that 'it would be unwise to incur any extraordinary outlay' in the matter. I do not advocate any extraordinary or even very heavy expenditure. A few cents per acre for all the coffee in the island would produce sufficient funds for the starting of the experiment. The suggested remedy is not of course a certainty,—otherwise there would be no two questions about its immediate adoption. But if nothing should ever be attempted for fear of possible failure, there would not be much progress in the world! The possible benefit is enormous,—far out-balancing the expense of a possible failure.

"I notice that one of the critics quoted by your correspondent impugns the value of the ladybird, partly because 'she does not extirpate the fungus.' Surely this is rather unreasonable! I presume the fungus in question to be the sooty growth usually associated with an attack of 'bug.' But if you kill the cause (the bug), the effect (the fungus) will soon pass off. Moreover this fungus is not in itself injurious to the plant. It germinates and subsists solely upon excrementitious matter from the bugs.

"As for your correspondent's concluding remarks upon scientific as opposed to practical work. In many cases the life history of an organism must first be known before a logical remedy can be suggested. It is possible that a scientist—from his special training—may be in a better position to carry out the first part

of the work; while the practical agriculturist may best know how to apply the results of the first man's labours."

To which we may add that there is surely a high negative value to be attached to the scientist's work when he is able to indicate—as Thwaites originally did and Marshall Ward later—the fruitlessness of the coffee planter trying to expel the leaf fungus from his fields when once it has taken possession. Now the fungus is supposed to be in a decaying state itself in Ceylon while the "green-bug" has long been regarded as a far more serious enemy; and science as well as practice points to a remedy in the "Vedalia ladybird" to be got from Queensland.—*Tropical Agriculturist*.

SISAL HEMP.

AGAVE SP.

[DICTIONARY OF ECONOMIC PRODUCTS, VOL. I.; A. 631.]

Results of Examination of a Sample of Sisal Hemp Fibre at the Imperial Institute.

The information (No. 34 of 1896) which follows is given as a Supplement to *The Agricultural Ledger* No. 18 of 1896 on Agave.

In acknowledging receipt of a sample of the fibre of *Agave rigida*, Mill., var. *sisalana*, submitted for opinion as to quality by the Superintendent, Government Botanical Gardens, Saharanpur, the Reporter wrote:—"The sample of Sisal hemp seems brittle, short, and to have lost in strength during preparation. In the present state of the European demand this fibre would, it is feared, not fetch a very high price. Aloe, Sisal, and other allied fibres are a drug in the market."

The quantity of fibre received was small, the produce of 2½ lb of green leaves only, but it was thought advisable to forward the sample to the Imperial Institute for favour of experts' opinion and a commercial valuation.

From information subsequently to hand from the Superintendent, Government Botanical Gardens, it appears that the plant has been under cultivation at Saharanpur only a few years, and that probably the leaves have not yet attained to maturity.

The matter was promptly dealt with by the Secretary and Director who replied as follows:—

From SIR F. A. ABEL, Bart., K.C.B., Secretary and Director, Imperial Institute, London, to GEORGE WATT, Esq., M.B., C.M., C.I.E., Reporter on Economic Products to the Government of India, Calcutta,—No. 560—69, dated the 12 March 1896.

I have the honour to acknowledge the receipt of the sample of Sisal fibre advised in your letter dated 5 February 1896. The quantity sent weighs only 12 grammes and is insufficient for a complete chemical examination, but this will be carried out as far as is possible with the limited supply of material, and the results forwarded by next mail.

The sample has been sent to two experts, both of whom have made a remark on the short staple of the fibre. For fibre of the length and quality of the sample, the present market price would be from £14 to £15 per ton, at which rate a very large quantity could be sold. If, however, similar fibre could be obtained of greater length, the value would be considerably enhanced, and reach £17 to £18 per ton. Mr. C. E. Collyer, one of our Expert Referees for Fibres, is of opinion that

Ladies in the mofussil do not always realize that they can by corresponding with PHELPS & CO. at their Ladies' Branch at Russell Street, keep in touch with all that is newest and most fashionable in the world.

better material could be obtained, if attention were paid to the selection of plants for cultivation on suitable soil.

Sir F. A. Abel kindly supplemented his previous letter by another giving the results obtained from a chemical examination of the fibre.

From SIR F. A. ABEL, Bart., K.C.B., Secretary and Director, Imperial Institute, London, to GEORGE WATT, Esq., M.B., C.M., C.I.E., Reporter on Economic Products to the Government of India, Calcutta,—No. 83—70, dated the 18th March 1896.

In continuation of my letter, Flying Seal Series No. 82, dated March 12th, 1896, I have the honour to forward the results obtained from the chemical examination of the sample of Sisal fibre. For purposes of comparison, the results which are given below are arranged side by side with those furnished by samples of Sisal from Trinidad and from the Bahamas respectively. The fibre suffers somewhat more in the hydrolytic processes than the other fibres, otherwise there is but little difference between them. The quantity of fibre sent was insufficient to admit of the carrying out of the "mercerising" and "acid purification" processes:—

	Trinidad Sisal.	Bahamas Sisal.	Indian Sisal.
Moisture, per cent ...	11.6	12.8	11.2
Ash, per cent. ...	1.0	4.4	1.7
Hydrolysis (a), loss per cent.	11.7	12.0	13.4
Hydrolysis (b), loss per cent.	13.5	16.1	17.2
Nitration, gain per cent. ...	32.9	29.7	30.8
Cellulose, per cent. ...	77.2	75.9	78.8
Acid purification, loss per cent.	1.0	8.1	...
Mergerising, loss per cent ...	8.9	13.4	...

These communications were acknowledged by the Reporter in the following letter:—

From GEORGE WATT, Esq., M.B., C.M., C.I.E., Reporter on Economic Products to the Government of India, Calcutta, to SIR F. A. ABEL, Bart., K.C.B., Secretary and Director, Imperial Institute, London,—No. 1226—76 F. S., dated the 29th April 1896.

I have the honour to acknowledge with thanks the receipt of your letters, Flying Seal Series, Nos. 79, * 82, and 83, dated 4th, 12th, and 18th March, 1896, respectively, on the subject of *Agave rigida* var. *sisalana*.

In reply thereto, I beg to state that a copy of the report kindly furnished by you has this day been forwarded to the Superintendent, Government Botanical Gardens, Saharanpur, from whom the fibre was received. I also propose to issue these letters as a fly leaf of additional information to our *Agricultural Ledger* on *Agave*. I would take this opportunity, however, to observe that in a communication received from the Director of the Royal Botanic Gardens, Kew, a less sanguine view is taken of India's prospects in the *Agave* fibre supply than would seem justified by the valuations furnished by the fibre experts of the Imperial Institute.

* Acknowledging receipt of letter covering sample of fibre and promising action on arrival of the latter.

RAMIE.

The following letter from Messrs. John Haddon & Co., Salisbury Square, London, E.C., dated 4th December, will be found of interest. We may mention that it was written in reply to some enquires of ours:—

Machinery.

RAMIE.—We have sent out several machines for the treatment of this fibre on the spot, and for your guidance we are sending you under separate cover our "Produce Merchant's Guide," [An extremely comprehensive and very useful publication, this, for all planters.—Ed.], giving full particulars on pages 20 & 21. You will understand of course that it would be necessary for us to know before supplying you with a machine what quantity per day you would be likely to require to turn out. Steam power also is a necessity for working the machine. If your friends would like to communicate with us, we shall be pleased to place any information we have before them.

With regard to whom they shall despatch the fibre for sale, we of course can handle this quite well, and if any such parcels are committed to our care, we shall be most pleased to remit immediately upon receipt of the produce, say, two-thirds of the value of the goods and accounts would follow in due course.

Picees.

Now with regard to prices. The raw *Ramie* is commanding just now from £15 to £16 per ton delivered here. This is a regular market, but the *Ramie* arriving here in a prepared state is more or less nominal, and it is difficult to get at quotations. Privately, however, we may tell you that we are hand-in-glove with one of the largest syndicates here, and we know that they have bought parcels up to £27 to £28 and even £32 per ton in the prepared state. Do you think that it would be a wise plan for you to make a small trial consignment? And we can assure you we will do our very best with same.

Personally, we are quite satisfied that sooner or later this *Ramie* fibre business will be a huge success, the articles we have seen prepared from the fibre certainly run silken manufactured articles very closely. The great drawback of course with regard to *Ramie* is its non-elasticity, but of course there are many articles which are now manufactured from silk in which elasticity can be easily dispensed with."

The following synopsis of a "Travers Lecture" on "Recent Researches in Commercial Fibres" delivered at the London Institute, just before the mail left, by Dr. Morris, C. M. G., Assistant Director of the Royal Gardens, Kew, is worth reproduction:—

After a brief review of the progress made in the production of fibres already familiar in commerce, Dr. Morris directed attention to recent developments in the singularly interesting fibres known as China grass and ramie. These, he said, had hitherto been regarded as at once the most attractive and elusive of fibres, and as having not only raised the greatest expectation, but led to the most lamentable failures. As the result of efforts extending over 50 years, these fibres were at last being utilized in this country in the manufacture of textile fabrics of a high order. The two plants concerned were members of the nettle family, but without stinging hairs. The China grass (*Bohmeria nivea*), a native of China, was suitable for cultivation in warm temperate countries; while the plant known in Assam as rhea, and in Malay Islands as ramie B. (*tenacissima*) was suitable only for tropical countries. It was pointed out that remunerative crops could be grown only in well-drained soils of an exceptional character. A plentiful rainfall, well distributed over the year, was essential, as well as a high and uniform temperature. Under such conditions crops of stems weighing 15 to 20 tons per acre could be produced in the year. This quantity would yield ribands or raw fibre of the value at present prices of £8; or filasse (the finished fibre) worth about £14. The cost of the cultivation in suitable localities was estimated at £4 per acre. The cultivation was recommended as likely to be advantageous in some parts of the West Indies, and especially to supplement that of sugar. The fibre, when completely cleaned, was capable of being used for the finest lace as well as for canvas and sail-cloth. In fact, the industrial application of this beautiful fibre was calculated to prove of the greatest service in the manufacture of textile fabrics of all kinds.

Rhea in S. India.

On another page will be found a brief resumé of a most unsuccessful experiment with Rhea in Wynaad. The plants grew vigorously, but the second year vast hordes of caterpillars appeared on the scene and relieved the proprietors thenceforth of all expense in the matter of removing the crop.

Rhea has also been tried some years ago in the Bowani valley, but was given up as a bad job. The improved machinery and better market now available should tempt experimenters afresh. By the way in our short advertisements Rhea seed is offered for sale.

FAURE'S NEW PATENT RAMIE FIBRE DECORTICATOR.

No more Ribbons or Strips.

New Machinery.

It is claimed for this machine that it forms the connecting link, so long sought for between the grower of ramie and the spinner and manufacturer of the fibre; and that its effect will be to place ramie on the list of every-day textiles to be produced and utilized without difficulty in any desired quantity. The battle has been long between the chemist and the machinist concerning the role each has to play in the production of ramie, and until the point has been definitely settled, the fibre, notwithstanding its magnificent qualities—strength, lustre, ductility, capacity for taking colour by printing and dyeing, and for mixing with other fibres, has been under cloud. The manipulation of the stems in the dry state so long advocated, has been definitely acknowledged to be erroneous, experience having proved that to obtain the full advantages of the many brilliant qualities of the fibre, the stems must be treated in the green state. The chemist has insisted that as little as possible must be done to the green stems by machinery, leaving the main treatment to be carried out by chemicals. The machinist has retorted that the fibre is seriously damaged by chemical processes, which take away its strength, its lustre, and its ductility, and that therefore machinery must play the important part; and so for many years the battle has been waged, first one side and then the other gaining the victory.

The problem, commercially considered, has been to obtain a machine, which can carry out economically the following processes without damaging the fibre: (a) Remove the woody parts from the green stems; (b) Remove the outer skin or cuticle, which has so long baffled all efforts, mechanical and chemical, to remove it; and (c) Extract as much as possible of the juices of the stems, so as to simplify and cheapen the degumming process. The two former processes are effectively carried out by hand labour in China, where workmen scrape each stem and remove the skin and the wood, but leave most of the juice in the fibre.

All inventors of ramie decorticators have concentrated their efforts on machines to produce ribbons. Needless to say, the object aimed at has fallen far short of the real necessities of the case, hence the long delays and numerous disappointments with which this fibre is associated. Ramie ribbons have three serious, almost fatal, defects: They contain a large percentage of woody matter; they contain the outer skin or cuticle of the stem, which has been the despair of the chemist to solve and remove; and they contain the major portion of the juice which coagulates in drying and becomes gummy.

Mr. Faure has aimed at the construction of a machine to produce *not ribbons but the fibre* in one operation, free from woody matter, from skin, and with the least possible amount of juice in it. His product is equivalent to "China Grass," but in an improved condition, because his machine is much more regular and efficient in its action than the varying hand labour obtainable in China, and because the possibility of adulterating the fibre is done away with. Mr. Faure's first decorticator obtained the gold medal at the last Paris trials. It was the best of the machines exhibited there and tested by actual work with green ramie stems. Being desirous of improving on his first attempt, he has since constructed several decortivating machines, each one showing marked superiority over the preceding ones. A

skilled engineer and machine maker, with every facility in his own works and ample means for carrying out his ideas, he had the benefit of another very important advantage, namely, the growing of ramie on his own estate in the Limousin near his works, which enabled him to practically test his ideas by actual experiments on the raw material—a combination of advantages probably not enjoyed by any other inventor of decorticators. Patiently and scientifically he has, step by step, worked out the problem; and the machine now produced represents the result of his several years' labours. It is simple, inexpensive, and does its work admirably.

It is fed by two men, working alternately, each holding in his hand about ten stems. The stems are used in the same condition as cut, with the leaves on. The operation of feeding is as follows: The stems are passed in twice. They enter the machine, leaf ends first, and after having been treated about two-thirds of their length they are withdrawn, an operation easily carried out, and fed in a second time, the thick ends first, so as to complete the operation. It frees the stems from all woody matter and from the outer skin or cuticle and extracts a large portion of the juice, thus producing fibre retaining all its valuable qualities.

The machine, which weighs 11 cwts., is simple in construction, very strong and not liable to get out of order. It consists mainly of the framework and driving gear, the decortivating drum carrying beaters, and the feed bed. This latter is the important feature of the machine, by reason of its special construction which varies at different parts to suit the various descriptions of work which the machine has to perform. The first part of the bed is curved outwards, the second is straight, and the third is curved inwards. The ramie stems are fed into the machine over the first part of the bed, where the woody portion becomes immediately broken and partly removed; the stems pass on to the second part, and as the speed of the beaters is considerably greater than that at which the stems are fed into the machine, a scraping effect is produced on the strips, seeing that the distance between the beaters and the surface of the bed is less than the thickness of the strip. This scraping action effects a double purpose; it attacks the outer skin and also all matters extraneous to the fibres. The strips or stricks of filaments then pass down vertically into the machine and the separated matters, viz., most of the woody parts, the skin and gummy substances, are thrown out to a distance by the centrifugal force of the beater drum. When the stems have entered to within a short distance of their end, the return movement is effected and they are withdrawn. During the withdrawal the following action takes place:—At the inward curve or third part of the bed, the filaments are slightly and gradually grazed by the beater blades, which throw out the coarser of the debris still adhering. The operation is performed with great delicacy, the fibres assume the position of the chord of the curve and are constantly agitated by the beaters. When the fibres arrive at the second part of the bed, as the space between it and the beaters is infinitely reduced, the entire removal of matters still adhering to the fibres is effected, and these latter leave the machine:—white, parallel and free from woody matter, from skin, and from the major portion of the juice. The conca bed or breast is mounted in such a way, that its position to the action of the beaters is easily regulated. The brackets which carry the bed are supported by spiral spring cushions and flexible legs, the object being to obtain a rubbing action between the beaters and the fibre, having for its special object the loosening and removal of the skin or outer cuticle. The elastic bed gives way or vibrates an enormous number of times per minute, and this produces the desired rubbing or "knuck joint" action between the beaters and the fibres on the be

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Trichy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Sun-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to Common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 60 ft. by 3 ft.

Quotations and further particulars will be furnished by our Tellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

“PLANTING OPINION,” COONOOR.

the shape of the feed bed causes it to remain clean and free from extraneous matter through the action of the beaters. Hocking is thus rendered impossible. All abnormal strains are avoided, and the machine can be kept at work from morning till night without stoppages for cleaning. The refuse falls underneath the machine and is removed from time to time. In the case of a number of machines working together, an endless band or conveyor, passing under the machines, removes the refuse continuously and so keeps the neighbourhood of the machines perfectly free from it.

Faure's machine is simple in construction, and capable of being easily worked by native labour in the ramie plantations or works connected therewith. Although simple, it needs to be constructed with the greatest accuracy in order to ensure effective working. The cylinder, carrying the steel beaters is perfectly balanced and accurate in its action; it runs at 400 to 500 revolutions per minute; the surface of the beaters is perfectly parallel with the setting of the feed bed and capable of working close up to it, say within a distance equal to the thickness of a piece of writing paper. The feed bed, the varying profile of which is of such enormous importance in the efficacy of the machine, is made with the greatest of accuracy and of the best materials.

With regard to the production, practical experience shows that two men working at one machine can treat 360 lb. of fresh green stems per hour, or about 32 cwt. per day of ten hours. The amount of dry fibre produced depends largely on the nature and growth of the stems; the percentage of fibre contained in green stems varies very much according to circumstances. On a 5 per cent. basis, the nett production of dry fibre by each machine per day of ten hours is 180 lb. When the stems are specially good, more than 200 lb. of dry fibre have been produced per machine in ten hours. Under ordinary circumstances production varying from 160 to 200 lb. of dry fibre in ten hours per machine may be expected.

The apparently small production per machine needs a word of explanation, seeing that decorticating machines are being made professing to treat large quantities of green ramie stems per day, but it must be borne in mind that their production is ribbons not fibre. Ramie ribbons or strips must always be unsatisfactory, and will, no doubt, in time disappear from the market. The buyer has no means of testing their value, the quality or percentage of the fibre, and whether damaged or not by the decorticating machine; hence he will only give a low price for an unknown article, in addition to which they cannot be highly compressed and packed into proper bales as other fibres are. Therefore the freight on ribbons is unduly high; they also contain a very large percentage of useless material on which freight has to be paid.

Faure's machine produces fibre, which will always rank higher in the market even than China grass, by reason of its regularity in condition and quality. The buyer can easily see and test what he is buying; he will therefore be disposed to give it its proper classification and pay its full market value; in addition to which by reason of the bales being well pressed and containing little else than ramie fibre, the freight and expenses per ton will be at the minimum.

The product of Faure's ramie fibre machine cannot be compared with the ordinary ribbons or strips. It is an entirely different article, and will fetch a very different price in the market. The machine, when treating good stems, produces about 5 per cent. of waste fibre, that is to say, fibre which escapes from the hands of the workmen. It cannot, however, be correctly classified as waste, seeing that it has excellent value for second quality ramie, and here we would note that in relation to ramie, there is practically no real waste, as the fibre is always saleable.

Its qualities of strength and colour are so great that, even for paper-making, the very shortest of the fibre always has excellent value and fetches good prices.

In connection with the question of fibre production and waste, the nature of the growth of the stems must be considered. If they are planted too far apart, the stems have a tendency to unduly throw out branches. Each branch represents a break in the continuity of the fibre of the parent stem. Recent plantings of ramie are being made with the stems much closer together, so as to prevent undue branching and improve the quality of the fibre. Green stems grown in a tropical or sub-tropical climate give the best results. The growth being quick the stems carry plenty of fresh green juice, which assists the decortication very much by leaving the fibre freely and carrying with it in its downward course from the beating point of the machine large quantities of extraneous matter. The condition of the stems at the time of treatment also plays an important part. In order to ensure the best possible fibre, the stem should be treated within a few hours of being cut. They should not be over-ripe, as the fibre deteriorates after the stems have arrived at maturity. The best plan is to cut them either just at full maturity or slightly before. The fibre thus obtained excels in whiteness and ductility, retains its full lustre, and shows to the best advantage during subsequent manufacturing operations, such as preparing, combing, spinning, dyeing, &c. Each machine requires about one horse-power to drive it. When a number of machines are working together less power will suffice; thus eight horse-power will drive ten machines.

Faure's patent decorticators were sent last year to Italy, Egypt, Tonquin, &c., and have more than justified the expectations that were raised respecting their action and the quality of fibre they produce.

A few words will not be out of place concerning the disposal of the fibre after leaving the machine. It may be dried at once and then baled, its condition being the same as China grass. Experiments made last season show that steeping the fibre in boiling water for about half an hour and squeezing it thoroughly previous to drying, gives very favourable results, as when dried the fibre is soft and separates freely. The gummy nature of the juice having been seriously modified by boiling, the final degumming process is rendered very easy, cheap, and short. The addition of about 1 per cent. of carbonate of soda to the water may be made if the circumstances are favourable. This partially degums the fibre and does away with any possibility of fermentation or deterioration during the transport to manufacturing countries.

The sole representation of Mr. Faure's interest, both for machines, licenses, and patents has been entrusted to Mr. Thos. Barraclough, of 20 Bucklersquay, London, to whom all applications should be made.—*Tropical Agriculturist*.

LETTERS TO THE EDITOR.

ANSWER TO CORRESPONDENT.

["BET." Your suggestion regarding the reprint of the late Mr. Pringle's article is one we shall be glad to adopt. Can you give us the dates of publication?—Ed.]

ENSILAGE.

SIR,—Will "Agricola" (P.O. of 9th) kindly give information how to make a "Silo" pit *air tight*? I am trying "Ham Ham" Grass Ensilage in lime. Also if he found cattle did well on his Ensilage and if *stall* fed on it. Thanking him in anticipation,
N. S. C. P.

PLANTING BASKETS.

SIR,—Will you or any of your readers kindly inform me of

the names of any firms who undertake to supply planting baskets other than Messrs. Andrews of Mettupalaiyam, and also what rates they charge delivered at Railway Station?

Yours faithfully,
ESSAUDELL.

A WONDROUS SHADE-TREE.

SIR,—I am sending you an extract from the *Indian and Eastern Engineer* on a shade tree for coffee in Brazil. There is a tree of the same family common enough in Mysore and S. India (*Pithecolobium dulce*), Seemay hunasse, Can., Tamil Korkapille, which ought to be as good as the one in Brazil. The Korkapille is used extensively as a hedge, but if allowed to grow attains a good height.

The nature of the tree "going to sleep at night," allowing the cool air and dew to reach the coffee, is what we want.

"BILLY BUSREE."

The *Kew Gardens Bulletin* contains the following notice of a tree highly esteemed as a shade for coffee in the Republic of Columbia which is taken from a letter addressed to Kew by Mr. R. B. White, dated Palmira, August 6th, 1895. The tree has been identified as *Pithecolobium polycephalum*, Benth, *Hooker's London Journal of Botany*, lii. (1844), p. 219. It extends to tropical Brazil, and was collected near Rio Janeiro by Miers. Mr. White writes:—"I enclose some seeds of a tree which is being used most successfully here as a shade for coffee. It has flowers in small white balls just the size of those of the sensitive plant, pods long, flat, compressed, with 15 to 20 seeds. Pods do not open, being held together by strong marginal veins; they simply break up when rotten. No one here knows the name of this tree. I have referred it to Mr. Lehmann, and he does not know it. It is a native only of Antioquia, and grows in a mean temperature of 75° Fahr. It is fond of stony poor soil. A tree 18 months old will cover 144 square yards of ground (12×12). It goes to sleep at night, allowing the dew and cool air to reach the coffee. When young the wood is soft, but on ageing it gradually gets a red heart, and becomes hard and durable. The seed I send has been bathed in sulphate of copper solution, and I believe it to be good, so you can try a few seeds in Kew by way of curiosity and send the rest to one of our tropical establishments to be reported on. When full-grown this tree may be 50 feet high with a spread of at least 50 feet on all sides. Nothing can be better as a shade tree. It is a poor liver, and does not exhaust the soil. It spreads out horizontally; it gives a good shade, not too dense, and during the night allows the dew to refresh the plants beneath. The leaflets do not litter the plantation, and are too small to harbour fungi and moulds. It is easily trimmed and brought to shape. The umbrella ants will attack it, but they can only get hold of one little sub-pinna at a time. They cannot get a good bite and cut out a real imposing umbrella, and so they do not care to draw much on this tree when once they have balanced up working expenses and output. This is an advantage."

[We have already published a notice of this leguminous tree some many months ago. Of the allied species *Pithecolobium dulce*, Can. Korkapille, Mr. Cameron in his *Jungle Trees of Mysore* writes as follows (abridged): "Manilla tamarind tree. Native of South America, naturalised in India and the East. Extensively cultivated as fuel and for hedges. Goats very fond of it. Under favourable circumstances grows into a pretty large tree, which coppices well." Has it ever been tried as a shade tree in Mysore?—Ed.]

COFFEE.

A NEW FACTOR IN THE MARKET.

As a rule, the South Indian coffee-planter does not evince precisely an engrossing interest in the movements of the industry in Brazil. True, his mind is fluttered occasionally by rumours of bumper crops from that country, that are going to smash up the market altogether.

Yet as this dire event has been regularly prophesied every year for the last decade, and prices still keep up to respectable level, he bids grim care avaunt and plods on happily. He has moreover a very solid substratum of fact for his feeling of security.

The prices for the finer sorts of coffee, among which the well-cured bean takes a very high place, are as stable as that for the finer makes of tea. And for a very simple and similar reason. In both cases the countries or districts capable of supplying the highest qualities are or were strictly limited in extent, and the demand therefore invariably in excess of the supply. We use the term "are or were" with purpose. For though with tea things remain, and seem likely to remain, in *statu quo*, a new factor has been introduced into the coffee market that deserves to be closely studied. We allude to the probable, or more correctly, possible effects of the present large influx of European, and especially British, capital into Brazil; and not only into Brazil, but into Mexico and those other coffee lands in the New World which together supply nine-tenths of the world's demands.

Before proceeding, we wish it to be distinctly understood that it is far from our purpose to pose as alarmist or prophets of evil in any way whatever. But we conceive that we should be failing in our duty to our readers to pass over without notice, the presence of a disturbing factor, the potential effects of which are difficult to over-estimate.

As we have mentioned before, East Indian coffee now occupies a practically unique position in the market, due to its uniformly high grade of excellence. A question of the utmost interest arises: to what extent is this excellence due to its inherent qualities derived from seed, soil and climate, and how far is it due to superior methods of preparation? On the answer to this depends much, if the distinguishing characteristics of our plantation coffee are mainly due, and we do not think they are not, to our peculiar local conditions, then all is well. But if, on the other hand, this excellence is more largely dependent on the care bestowed in curing, both on the estate and in the curing works, then indeed is there some cause for apprehension.

The coffee countries of the New World have hitherto been very content to garner their large crops with the minimum of trouble and expense in gathering and curing. And this is not to be wondered at, if we take into consideration the nationality of the planters, and the social atmosphere in which they are enveloped. Descended in the most part from the old hidalgos and noblemen of Spain and Portugal—those intrepid conquistadores who filled the Old World with their fame and the New World with their infamy—there is nothing on which they pride themselves more than their ancient lineage. They do not trouble themselves about details of cultivation, or take much concern in the hundred and one minutiae of plantation work. The blue blood forbids it. They view their vast possessions for their estates or haciendas are reckoned in thousands and tens of thousands of acres, with much the feeling of the old seigneurs and ancient nobility of France and England, content to take what the gods gave, as long as all was well. Of late, it is true, the abolition of slave

has roused them to a sense that the times are changing, and that they must rouse themselves in earnest. But the southern strain in their blood, intensified by the tropical climate, is as yet too powerful for their new born enterprise to counteract.

Added to this the fall in both the silver and paper exchange has been the means of largely restoring their former losses. So that it may be said with absolute safety that if Brazil were left to itself, we should have little need to fear from its capabilities for producing apparently unlimited quantities of low grade coffee.

Aye, if Brazil were left to itself. But this is precisely what is not being done. European, and especially British, capital is being attracted freely, and the total amount of coffee land now under European control is by no means small. And the enterprising Briton has an insatiable greed for wealth. Ten per cent. will never satisfy him, if he thinks he can get twenty; and he will not stop at twenty per cent. if there are reasonable chances of getting twice that amount. A Brazil coffee plantation pays very well in the ordinary way, but the British shareholder wants to make it pay better, and is casting about for all manner of means to secure that desirable result. Take the Dumont Coffee Company, for instance. Last year its crop was about one-tenth of what Ceylon's used to be in its palmiest days, say 73,000 cwt. or roughly a quarter of the total yield of South India. Well, the great differences between the prices of American and Indian coffee has struck the Managers of this company very forcibly, and they are taking steps to imitate our methods of curing in their own works and factories. And that their hopes are not without foundation may be noted from the example of Costa Rica, a country whose produce occupies a very favourable position in the market compared to that of Brazil. The higher price enjoyed by the former country is stated, and we believe, on excellent authority, to be wholly due to its improved methods of curing, introduced many years ago by an ex-Ceylon or Indian planter. We have not statistics giving the exact extent of land, in coffee or fit for coffee, owned or controlled by European capital. But put into crop, and the American crops are glorious ones, there is little doubt that it more than exceeds the total yield from South India. And be it noted that the success of one company is sure to be noted and followed up by other companies, and perhaps even by the Brazil planters themselves. Then will come the tug of war.

We do not believe, nor do we wish others to believe, for a moment, that the long skilled experience and pluck of planters in South India will allow them to be worsted in the struggle. They have been in the depths ere now and have risen again more buoyant and prosperous than before. We would only wish to point out a very simple moral. If it be a fact that the general adoption of improved methods of curing have the effect, it is surmised they will, the energies and brains of planters will be taxed to the uttermost. Planting has become a business in which all possible means should be tried to secure its success. In short, planting tends or should tend, every day to become an exact science, a pursuit in whose aid should be invoked all the services that experts, be they botanists, chemists or

skilled gardeners, can render. There is still far too much routine, too much "rut-work" on plantations. The tendency is still too great to decry everything that has not become hoary with age, as mere unpractical theory.

We will conclude with a report of a by no means imaginary conversation. The owner of a three hundred acre estate was complaining about the poor crops of now-a-days and the comparatively poor returns he was getting. A non-planting friend, with theories of his own, instanced a certain patch owned by an old retired planter who had "seen better days," as giving regularly seven cwt. per acre. Ah yes, but that is only garden cultivation. It could never be done on a large acreage, look at the manure and the cost in superintendence! Like all men with theories of his own, the non-planter remained unconvinced. What is your present manure and cultivation bill? It was as high as a hundred rupees per acre. The "garden planter" only spent twice that. And your superintendence? Say twelve rupees per acre. Reckoned at Rs. 200 a month the "garden planter" spent just ten times that amount. There you are, exclaimed the other triumphantly, how could I afford that with my profits? Why I should lose twenty rupees per acre on superintendence alone, without counting the loss in cultivation of one hundred more. It's as clear as ditchwater, didn't I tell you it wouldn't work?

Wait a bit, said the pig-headed Theorist. My friend, the "garden-planter," nets *two hundred and forty* rupees per acre, after deducting all expenses of superintendence and working. What have you got to say to that? The discussion closed here.

With a certain amount of toning down, there is a moral to be drawn by some from the above, an they would. It is rather clearer than ditchwater, we think.

First beginnings.

It is said that all the coffee trees now growing in America are the progeny of a single plant introduced in 1714. There are some 60 species altogether of the coffee plant, the most valuable being natives of Africa. Its introduction into Mysore is stated to be any time between 500 and 200 years ago. We should be inclined to fix it rather at the former than the latter date, as a considerable time must have elapsed to develop the peculiar characteristics of the Mysore "chick." There are a certain number of Indian varieties besides, and as far back as 1696 the Dutch carried the seeds of coffee trees from Carranova in Malabar to Java, which country produced as much as 30,000 lbs. some 23 years later.

Costa Rica.

The average yearly crop from this district is about 350,000 cwt. The climate is said to greatly resemble that of Ceylon, the latter being seven, and the former ten, degrees north of the equator. The hilly country lies between two seas or oceans, and rises to 7,000 or 8,000 feet. The dry season in both being from January or February till May, the rest of the year wet with occasional dry intervals in August or September. The crops are reported from the most authentic sources to be simply huge, a general estimate of 15 cwt. per acre being considered about correct. The trees

are planted ten to twelve feet apart, *i.e.*, some 300 to 400 per acre. As mentioned elsewhere, the pulping and curing are on modern lines, with the result that Costa Rican coffee sells up to 107s. per cwt. The margin of profit can readily be imagined to be extremely great. The only drawback is the scarcity of labour, plucking being simply a general stripping, owing to lack of hands. The native Indians will not work, the labour being performed by Costa Ricans, who claim to be pure Spaniards. The Government is doing its best to encourage immigration of poor Spaniards or Italians. Of course the outcome has been a Company: capital £120,000; land 22,000 acres, unplanted forest, from 1,000 feet to 7,000 feet elevation. The name of the venture is the Sarapigni Company. There is one railroad in the country, and the Government is stated to be, for South American republics, fairly honest.

IMPROVED COFFEE SEED.

INTERESTING EXPERIMENTS.

MR. L. W. GREY, of Pykara, Nilgiris, has during the last two years been making some interesting experiments with regard to the production of a first-class coffee seed, containing all the elements necessary to enable it to give seedlings of more than ordinary vigour. A short time ago he submitted two samples to Mr. D. Hooper for analysis and report, on which this gentleman replied as follows, in a letter dated Ootacamund, 6th January 1897:—

"You send me two samples and you ask me as a chemist to analyse and report upon the two samples, giving their value as plant producers And then you say again that "No. 1 produces very good plants."

"As you told me the difference in the preparation of the seeds it would be undesirable to submit them to a full proximate analysis as the ash would not affect the proportion of oil, caffeine and albumen. I tested the seeds for the amount of ash and found in the first sample as received 7 per cent. of ash, and without the parchment 3.71 per cent. The No. 2 coffee as received contained 2.6 per cent. of ash and without the parchment the same. This shows that some of the soluble ash has entered within the outer coat and contributed to the composition of No. 1. The increase of ash would probably improve the germinating power of the seed and not retard it, and so make a vigorous plant. The ash of the No. 2 sample is very poor and is likely to produce a weak seedling and a poor plant liable to the attack of any disease that is prevalent at the time The potash and phosphoric acid in this ash No. 1 would afford the first food for the young plant and give it the necessary start in life that it requires. The absence of this stimulus in No. 2 would be productive of a famine-stricken coffee bush, especially if it were planted out in poor soil. I do not know whether I have made myself clear or have done what you wanted. On reading your letter again I think I have answered your queries and could do nothing more but put the seeds out into different pots and await developments, but this I have no time for."

The No. 1 sample is seed prepared according to certain methods which Mr. Grey does not intend divulging at the present moment. We may mention he will have 200 bushels for sale next October and November at Rs. 50 per bushel delivered at Ootacamund. The No. 2 sample, upon which Mr. Hooper comments so unfavourably, was prepared, says Mr. Grey, in the manner coffee seed is usually treated, that is, with no treatment whatever.

It is to be noted, however, that this latter sample seems to be an exceptionally poor one, as by Mr. John Hughes'

analysis Ceylon parchment coffee is represented as having 3.30 per cent. of ash. Other figures given in Mr. Cochran's Ceylon Manual of Chemical Analysis show that "raw" coffee (presumably minus both parchment and silver skin as it was tested against roasted coffee) averages about 4.4 per cent. of ash, some being as low as 3.97. We prefer, however, taking Mr. Hughes' figures, as in the other case the bean must have lost a great deal more moisture and consequently the ash percentage shows up higher. Mr. Grey's No. 1 sample is certainly excessively rich in ash, having 7 per cent. compared with Mr. Hughes' 3.30 per cent.; and Mr. Hooper's comments are worth careful noting.

There is still one thing we should like to point out, and that is, the desirability of such additional data as the weight in lbs. per bushel of the two samples, and the amount of moisture present in each. Mr. Grey might also do well to have samples of seeds from other estates analysed in the same manner. In concluding we congratulate him on initiating investigations that may possibly prove of very great importance to the industry. The details of Mr. Grey's process are such as to lead us to expect far greater results in the future, if he continues his experiments. According to reports of certain somewhat similar trials made in France and England with potato seed, most gratifying results were obtained, and, though bearing in mind the different nature of the two products, it is not unreasonable to hope for like success resulting from Mr. Grey's experiments. Since writing the above, we have heard from Mr. Grey, who points out that the Ceylon analysis was made in the good old days when leaf disease was in its infancy and that later analysis would show a different tale. He also asks us to procure him samples of seed coffee from Mysore, Coorg and all other districts, and he will have them analysed. Samples of 100 beans each would be quite sufficient. Will some of our friends kindly oblige?

SHADE AND COFFEE IN MYSORE.

(Communicated.)

In reply to Mr. Waldegrave Thompson's queries *re shade* in the *Planting Opinion* of May 9th, No. 18, and his letter of July 7th in No. 27. As Mr. Thompson complains that if one answers his queries, I send you my experiences and trust they may be of use to him as well as to others, and may be somebody else will be roused by his appeal and give their opinions.

Shade is a subject of the greatest interest to all planters and has every year been growing of greater importance and one on which so few men seem to agree on all points. There is not the slightest doubt that we in Mysore have been able to fight borer and leaf disease by having kept our shade or grown it where needed.

Perhaps some of the Mysore Coffee Company's people will give you the necessary information about those places. It is many years since I saw them and they were then not doing very well, not from the system of cultivation being defective, or the kind of shade or want of it, but from want of sufficient and regular supply of funds for keeping up the large extent of land under coffee.

But there are many other places besides the M. C. C. Estates opened under the original shade and well worked splendidly, namely Cannon's Places "Mylemoney," "Busgode" and "Balur" giving their 3 to 5 cwt. an acre, Porter's "Santavari" producing about the same; Courpalais' "Sumpigay Khan," Denton's "Kulhutti," Meppen's "Arobudukool" and very many others in North Mysore. I don't know what these are giving in the way of crops now, but they were all opened out under the original virgin forest, and I don't think such a thing as a burn was done on any of them in the old times. "Mylemoney" and "Busgode" are still under very dense original and some very bad shade, and although the oldest European estates in Mysore are still giving splendid crops, Mr. Thompson wants particulars on:—

1. Shade grown on estates originally thrown in the open.
2. „ planted together with coffee.
3. Original jungle left.

"Shade grown on estates originally thrown in the open."—I don't think there are any places in Mysore that have been intentionally felled "bang in the open." Lots of estates have had the shade that was left scorched and burnt and large fields left without a stick, so we can dismiss No. 1 and go on to No. 2 which covers it.

"Shade planted together with Coffee."—Most of the estates opened within the last 15 or 16 years in Koppa Sullebille and the Jagarvalley have had all the bad shade trees cut out after the clearing, lopped up and burnt off. Shade in the shape of "Atlas," "Jacks," "Howligay" and Cedars, has been planted regularly with or immediately after the coffee. Wherever this has been done systematically and early, the shade has come on splendidly and the lines of young trees 30 and 40 feet high are a sight. And there is no doubt that with the Coorg variety of coffee the first three or four years cannot be too open; after that when they begin to crop, they must have shade. For quick returns for money expended, this is without doubt the best way to go to work. After a good burn the land is very clean, and lining and pitting and filling can be got through more easily than land that has been under-wooded and left to rot. Time, which is of so much importance, is saved and a larger clearing can be done. Young plants, both coffee and shade, too, come on magnificently in the burnt land (provided it has not been over-burned), and in proof of its success one has only to see some of the Sullebille Koppa and worked Jagarvalley estate which are giving their 3 to 5 cwt. an acre. The burnt places come on very quickly and give early returns, some having given phenomenal maiden crops and practically "wiped the state" by the proceeds. With good and regular cultivation and an early intelligent application of manure, estates opened under this system, notwithstanding their early maturity and crops, do not show any signs of exhaustion. But of course it is all a question of capital and labour if your weeding has unavoidably been delayed; the way that weeds can and do come up on the burnt soil is a caution. Every imaginable sort of beastliness in the way of weed and thorn and burr comes up and grows into scrub jungle while you are looking on. Clean hard weeding from the first is the only chance to keep the estate clear of weeds and a digging as early, in fact it cannot be too early, as

possible. If these two works happen to get neglected and the shade does not get put in early after the coffee, the plants get a shock that many do not recover from, and the vacancies will be more plentiful than the standing plants. And in the second year the vacancies have a way of not coming on, which is only equalled by the want of growth of the second year's shade trees.

The advantages of this system are obvious from the above, but that there are many disadvantages will be admitted. Of the great loss of accumulated humus and nitrogen by the burn, I will say a few words about later on. But if the felling and lopping has not been done in time, and a good burn done before rain comes, the leaves drop from the loppings and the twigs will not burn, and the constant heaping and burning costs a lot, and the ground is simply littered with branches and twigs that get in the way when lining, pitting and filling and again when digging; in fact a bad burn means 25 to 30% added to the expenditure and gives the clearing a very untidy appearance. It is neither one thing or the other. Then again if the heaps of loppings are very large, the land gets so burnt that nothing will grow on the patches, for years, or a high wind gets up and a big running fire is the result scorching and burning the shade that has been left, making the clearing too open. Charring the unlopped trees which get so hard, they require twice the number of coolies to lop up.

Original jungle left.—All the oldest estates in Mysore were opened under original shade and that very dense. After underwooding and removing all small trees, the plants, picked up anywhere out of Gowda's "hitloos" were dibbled in in twos and threes in a bunch. I remember the first planting I ever saw done (some time very very long ago, I am frightened to think of the year) coolies had been sent with a request to a neighbouring Gowda. For permission to pick up plants out of his hitloo and they returned with bundles of long lanky stems with three or four pairs of leaves at the end, the bundles being tied with more coffee plants. I was sent out with the Overseer who brought a few coolies and each man was served out with a bundle of plants and a crowbar. The bar was jammed into the ground and a hole made; the cooly held the top of the plant in his hand and the stem above the root between his big and first toe, and guided it into the hole two or three jabs with the box round the plant, which was drawn up a few inches, to be sure of a straight tap root, a small war dance round the plant by the cooly, to run firm and the plant was planted. But to return to our subject very little else was done, but rough underwooding; weeds did not grow under the dense shade, and if a planter was inclined to overdo it, he chopped up the surface soil for a few inches and put it down in his diary as "digging." In the course of time these plants bore crop. There were no such things as lining and pitting or nurseries. "Arabidcool" was the first place systematically lined and pitted, but the shade of the nearest big busree tree in a gowda's garden was the nursery, and I believe a lot of the old trees are still giving decent crops. Cannon's places, with the exception of "Balur," are not planted in line. There are very many old native places in the Jogar Valley planted originally and now over 60 to 80 years old that still have the two and three old trees growing

in clumps, with stems as thick as one's leg. But wherever these places have had the shade cut out in the later years and been put in the open, and the old system of so-called cultivation carried on, they have gone out after one or two big crops. I may as well get back to opening under original shade again.

There is no doubt that to destroy by burning the large amount of accumulated humus, the droppings of numberless years seems to be a most reckless way of going to work, and the loss after a heavy burn and the succeeding monsoon's wash must be incalculable.

Some heavy clogs and loams may be improved by the process of burning, but the lighter porous sandy soils must suffer to an extent that would take them years to recover from. But it is not so much the soil that gets burnt as the surface, the rich nitrogen bearing humus.

But if one could "eat one's cake and keep it," that is find some practical means of saving one's humus and at the same time get so much of the soil charred and burnt as to give the young plants the start they need. If one could turn in the surface soil of 5 or 6 inches and bring a layer of new green soil on the top to cover it so effectually that it could not get burnt, then fell, spreading the lopping over the surface and get a light burn charring the new surface soil. I say if we could do this, it would be the means of saving much valuable mould and manure that would be stored up in the land to be drawn on in future years.

To cut down the forest and shove a firestick in and drive out all the nitrogen and then to allow the mineral matter in the form of ashes to be washed out of the soil by the first heavy rain is such a wasteful way of getting rid of what is a source of manure for years to come—we destroy all this to gain a few months time and spend the rest of our lives and large sums of money in trying to remedy the evils we have knowingly committed.

But digging in and burying the humus and turning up a lot of green soil, without weathering or burning it, I don't think answers. Young plants do not seem to come on well in the new soil. The sun and air have not had a chance of acting on it, and now we know that the nitrogen-producing bacteria do not thrive at a greater depth than 4 or 5 inches. Consequently the young plants with their immature roots are robbed of all available and assimilable food and are starved. I have heard of land being underwooded and pitted and the bad shade cut out and lopped up and put into lines and all the pits filled with twigs and "kutchera" of sorts and burnt in the pits—the ashes being taken out when filling and then put in mixed with surface soil and charred sides of the pit. This ought to give the plants the necessary "leg up" they require.

The difficulty is to find the happy mean, to avoid the two extremes to save the leaf mould and still give the plants the little fillip up they need. But not to run any risk, I say it is better to be on the safe side and save the humus and leaf and loppings and decaying wood and let the sun and rain and air do their work slowly but surely what a firestick will do in a few minutes, with the chance that what has been gained so easily may be as easily lost. The former is a more deliberate way of getting rich perhaps, but it is sure. In one case you have banked your capital,

and if you "can stay" are bound to reap the benefit of it. In the other you are working on your capital and may lose it.

But the trouble is not being able "to stay;" many of us at work on a small capital of course try to get an early return as possible, and what seems easier than to do a big clearing; get a good burn and a large planting done the first year and then get a good big maiden crop. But with the small capitalist, items not in the estimate will crop up; the money runs out only too soon; the maiden crop is a failure. Then he has to mortgage and borrow, and back a mortgage to grow against any coffee yet invented and the worse the seasons and the poorer the soil the better it grows. It seems to be the only thing that will grow with any certainty on some places. And the trouble comes when you have to face the music. It's wonderful what a lot of interest does accumulate in a place, not quite the kind of interest you did take in it, but a good solid petrified interest that works out in rupees, annas and pies.

I have been trying awful hard to tell you and Mr. Thompson all about coffee planting under shade, but don't seem to get any "forrader;" I would recommend him to underwood line, pit, fell and lop up very fine, put as much small stuff and rubbish in the pits and stock all logs and big branches in the lines, up and down the side, of the hill (not across) they form a regular shelter belt and barrier for the line of young coffee. As soon as the stuff in the pits is sufficiently dry burn it. When filling take out the ashes, fill in the pits up to about 3/4, with good surface soil; mix the ashes with more surface soil and fill in breaking in the charred sides of the pit as he does so. I would recommend him also to pit for and treat his shade pits in the same way. And if he will just add 2 to 4 oz. of oilcake and bone and pinch of nitrate of potash to each plant and then dig as early as he can, he will have a clearing that will do him good to look at. Of course if he can't get the oilcake, cattle manure and good short stuff if possible, with 2 oz. of bone meal per plant will do just as well if not better.

There are one or two other questions he wants answered which I will try and do some other day.

"GAS-BAG."

TEA.

Re-firing in London.

There is a movement on foot to start a re-firing house in London, as to restore to tea that briskness which it is so apt to lose on exposure to the damp London air. It will have to be extremely carefully done though, or there will be wailing and gnashing of teeth among Indian planters.

The Share Market.

Last year again witnessed increased demand for tea-shares from the investing public at home. This is shown by the marked rise in the price of shares of all the first-class companies, the debenture stock rivalling the position held by gilt-edged securities of the first class. The interest obtainable, despite the price of the shares, from a careful investment with reasonable security, is 6½ per cent. on ordinary and 4½ to 5 per cent. on secured preference.

flavour extract.

We notice in a contemporary the suggestion that efforts be made in India to obtain an extract of tea possessing all its qualities of flavour and, we presume, "body" also. The matter is certainly worth investigation, but as such a work would demand the highest skill, the extract industry will not be established yet awhile in India. Borroughs Wellcome's bloods are the first step in this direction, and there is no doubt it is a right direction.

best fasteners.

A clever American invention has just been patented. It is a clamp for fastening tea chests or other wood boxes. The clamps are of two kinds, one of steel having eight teeth, and the other of coppered steel having four teeth; either will effect considerable saving in time, labour and expense. Some thousands of chests have already arrived in a satisfactory condition from India entirely fastened with clamps of this kind, with very few nails, and no hoops being used. This little novelty is well worth the attention of tea planters.

tea in China.

The Chinese "creeper," Mr. Sing Put, who recently proceeded to Ceylon to pick up some wrinkles in the working of modern tea-machinery, gave some rather interesting details to the Ceylon papers. Imprimis he states, contrary to all we have hitherto heard on the subject, that there was no tea in China over 80 years old, the custom being to plant out fresh, apparently in the same old fields. Manuring he stated spoilt the flavour, but if this flavour only enables him to get 8*d.* a pound for his best Flowery Orange Pekoe, it does not strike us as being worth much preservation. The yield per acre on Mr. Put's plantation, which is a thousand Chinese acres, runs out to about 160 lbs. per annum, which is very little. We may mention that this gentleman paid his visit of inspection on behalf of the Foochow Tea Improvement Company, a mixed English and Chinese venture, to whose operations we have already alluded.

review of the year.

In their report dated 31st December 1896, printed, except the tabular forms, in full in our Market Supplement, Messrs. Gow, Wilson and Stanton have many interesting figures on the progress of last year's trade. The consumption in 1896 was greater than ever before, being 226 millions against 208 in 1893. The consumption per head too, rose to 5.73 from 4.1 during the same period. The consumption of British grown tea increased 11 millions in one year, the fall in China being 6 millions. The percentages were: Indian 40%, Ceylon 35%, China 9%, other kinds 2%. Over production is an evil which is steadily kept at bay for the present. Foreign markets are growing in importance, consuming last year 42 millions against 27 in 1893. Exchange averaged 1/21½ against 1/13½ in 1895. The average price of Indian tea was 8½*d.* against 9*d.* last year, and over 9¼*d.* in 1894. The average for the season (from 1st June) up to date was 9¼*d.* against 8½*d.* last year. Market kept fairly steady except during the close of the year, when medium qualities went down as they have ever done. Ceylon averaged 8¼*d.* against rather over 8½*d.* for the

preceding two years. Java is gradually improving her position.

Manuring in Ceylon.

That faithful guardian of the interests of the Island planter, the *Ceylon Observer*, has a theory that chemical manures are likely to cause serious damage to tea besides unduly increasing the yield. So he has issued a set of questions concerning manuring in Ceylon, and from the answers already published, we gather the following impressions. That the practice of manuring, though not general, has "come to stay." That bulky manures are almost *non est*, and that little prejudice in their favour exists. That consequently artificials are practically the only fertilizers used, castor poonac and bones being the favourites, in the mixture of four to one. That the effect on the yield is undoubted, an instance being given of some of the oldest manured tea in an estate giving 200 to 250 lbs. more per acre than unmanured tea of a similar age on the same estate. On all hands the value of the tea is said, if anything, to be enhanced.

The above confirms our own opinions very strongly. To begin with the yield and general health of the bushes. After a certain number of years, a very large proportion of the most valuable constituents of the soil are lost, not only by the crops removed, but far more so by wash due to the modes in vogue of careless cultivation. If manure is applied, the bush must largely benefit by making healthier and freer growth. Its roots will extend further into the soil to catch the plant-food carried down by heavy rain. The ascent of the sap will be quicker and more abundant, the bark will be less "bark-bound," and being in better health all round, the bush will be far less liable to the attacks of blights or diseases.

Now as to the flavour question. It is obvious that "flavour," as with the other constituents of the leaf, must primarily be derived from the soil. It is merely an elaboration of the various salts in the crude sap, and if these salts are deficient in the soil, how can they be found in sufficient quantities in the sap? True, this process of elaboration demands certain conditions, such as moderately slow growth of the flush, to enable the sun to effect its full influence on the leaf sap. But, provided manuring is carried on in such a manner as to avoid excessively quick flushes, or in other words if the use of poonacs or other nitrogenous manures is somewhat limited, there is no reason to suppose that the original flavour will be at all seriously affected. But besides flavour there is "body" to be considered, and on all hands it is admitted that the percentage of this quality is greatly increased by the use of manures, especially when carried out on poor soils.

DIGESTED TEA NOTES.

II.

(Continued from our issue of 5th December, 1896.)

Varieties.

There are three recognised varieties, two being Chinese, *Thea bohea* and *T. viridis*, and one Assam, *T. viridis assamica*. To botanists the differences between the Chinese and Assam

varieties are very slight, to practical planters they are infinite, requiring different treatment from the nursery to the dryer. To put it briefly, the China jat is stunted and many-stemmed, with very small leaves. The Assam variety grows into a tree, and on the tea-garden, develops as a rule only one stem, the leaves are very large. The former is a much hardier plant than the latter, and thrives at elevations where the latter only exists; but the Assam bush up to 6,000 feet gives quite double the crop. But whereas the China bush loses almost all its desirable qualities when at a low elevation, the Assam even at fairly high elevations retains many of its low-country advantages.

Hybrids.

These originated accidentally from the Assam tea being crossed with the imported China. The term Hybrid is a very loose one and comprises anything from a China once removed to an Assam once removed. The general favourite is undoubtedly what is termed an Assam hybrid, namely a variety that offers the fewest possible differences from the indigenous Assam. The rule observed by practical planters is to buy their seed from gardens or districts specially renowned for all-round excellence, Manipuri coming first, then Bazaloni, Talcock, Chadna and Singlo. There are others also of course well worth getting. Many planters in South India seem scared at being asked to pay anything over 80 rupees a maund, or say a rupee a pound, f. o. b. Calcutta. Whereas prices for *good* seed range as high as 120 rupees in the Tea districts of Upper India, and even with those prices orders should be booked at least a year beforehand.

Law of crossing.

The produce of a flower fertilised by the pollen of another more nearly relates to the character of the pollen-giving plant than to the other. In fact heredity is more influenced by the male than by the female in this case. As a "perfect hybrid" would be more valuable than the best of either the Assam or Chinese varieties, Mr. Bamber recommends artificial crossing of the best Chinas to, presumably, the best Assams, the pollen of the former being applied to the stigma of the latter.

Soils.

Soil is simply decayed rock and decayed vegetable matter. And the more decayed or soluble they are, the better will plants thrive therein. The decayed rock gives the minerals, and the humus gives the nitrogen. The richest soils are alluvials, *i.e.*, formed by the silt of rivers. The decay of rock (and by "rock" I mean all insoluble minerals, whether in lumps or as soil) is effected by various means. An important one, from the planting view, is that of water, especially when it contains oxygen, carbonic acid or saline solutions or lime. The first can best be supplied by thorough aeration, draining and deep digging. The latter, by the decay in the soil of vegetable matter and also by application of lime. The saline matter can be supplied either as crude salt or as salts of potash, etc. The fertility of the soil is moreover affected by slope and aspect, and temperature of the soil by the heat of the sun's rays. Usually the more finely divided the soil, the more fertile it is, though if so finely divided as to form very compact and

adhesive clay, the formation of roots will be greatly hindered. Again the more clayey the soil, the greater is the depth from which sub-soil moisture can be drawn in times of drought. The moisture holding powers of a soil depend largely on the humus present, hence sandy soils are greatly improved by green-manuring. Now comes a practical point, to be seized on by practical planters, who often have the most fantastic notions on this subject. Evaporation is greatest when the soil is occupied by a crop, *i.e.*, in the dry weather, the more weedy the more the dryer it will be. On clean land, the harder the surface, the greater the loss of moisture: moral—keep stirring the soil in dry weather. In moderation, the warmer the soil, the better the growth of the plant. Wet soils are invariably cold. Almost every soil contains a sufficiency of plant food, the great difference between poor and rich soils being that in the former case almost none of the food is soluble. Clay soils are almost invariably rich in potash. Lime is an invaluable constituent of soils. It mellows and "warms" clays and improves sandy soils by increasing its moisture-holding capabilities. In most tea soils, however, there is very little lime, but magnesia largely takes its place.

The Chinese hold that the quality of the tea wholly depends on that of the soil. In a measure this is true, but climate generally has a far more important effect. Tea will grow in any soil, but thrives best on thoroughly friable loose soil, in which its roots can freely extend in all directions.

In Assam the best soils for both yield and quality are pale, reddish coloured rather sandy loams, containing a good proportion of organic matter and with an open and free subsoil. An abundant and, note this, ye sucking tea planters of Coorg, a *well distributed* rainfall. Bamboo forest soil has been found excellent.

A blue clay subsoil is to be avoided, as the colour is partially due to the lower forms of iron, which, as "Nitrogen" has shown his readers, are such a deadly enemy of coffee, though with very good drainage and cultivation they do well; when soils are light and porous little cultivation is needed, and weeding (burying it is the Assam method) is only necessary when the jungle gets mixed up with the tea-bushes. I cannot help thinking that Mr. Bamber makes a serious blunder (page 57) when he says that a large supply of carbonic acid is indispensable to the use of the growing plant. However, he is no doubt quite right when he says that rapidly decaying vegetation induces a luxuriant growth, whatever the precise cause may be.

In Assam and Cachar, etc., the soils are mostly either low lands, practically reclaimed swamps, or table land slightly raised above the swamp level. The former give huge yields but the quality at first is very coarse, though improving gradually.

Mr. Bamber then gives a long list of chemical analyses which are too elaborate to more than refer to, nor would they be appreciated by the practical planter, who is the very man I want to get at.

It may be noted that old village sites should invariably be well dug and drained before clearing, as though usually extremely rich, yet certain poisonous salts are found whi

must be got rid of before planting. To high elevation planters, such as are on the Kannan Devans and Nilgiris, it will be interesting to note that the only marked difference in the Darjeeling soils, as compared with those of Assam and Cachar, was the comparatively large percentage of lime. The moral of this: use lime freely, but, unless you have excess of humus, always as carbonate, *i.e.*, slaked. Where lime is deficient magnesia seems to replace it with apparent advantage. A fairly representative Darjeeling soil gave the following analysis:—

Moisture	...	...	21.55%
*Organic matter and combined water	...	...	11.28%
Sand silicates	...	...	70.33
Potash	...	...	2.50
Lime	...	...	.25
Magnesia	...	trace	...
Oxide of iron	...	...	5.97
Alumina	...	...	9.27
Manganese	...	...	.13
Phosphoric acid	...	...	.27

Total ... 100

*Containing nitrogen equal to Ammonia ...	...	...	.535%
Do. nitric acid	...	...	.005

The high percentage of potash was derived chiefly from the easily decomposable potash mica.

The question of lime being a most important one, it will be interesting to note that out of samples from each district the average percentage was as follows:—

Assam	.07	(High prices and good yield).
Cachar	.06	(Indifferent prices and „).
Kangra	.29	(„ and fair yield).
Darjeeling	.32	(Excellent prices and poor yield).
Dooars	.22	(Low prices and huge yield).
Chota Nagpore	.01	(Very low prices and indifferent yield).

The main features in all tea soils are:—

1. Lime: very little.
2. Sulphuric acid or sulphates: only traces.
3. Manganese: abundant (this is found in ash of tea.)
4. Nitrogen: the more nitrogen, the more luxuriant the tea.
5. Open soils with porous sub-soils are better than compact clayey soils.
6. Rapid exhaustion of soluble salts in the heavy rains.
7. Phosphoric acid: mostly in insoluble form, and phosphatic manures (bones, superphosphates, &c.) give excellent results.
8. Mica: fairly abundant—soils rich in potash.

The following analysis of tea will be found useful for reference. To simplify it I shall omit all but the most important constituents, *i.e.*, those which have to be replaced by manures;—

Nitrogen	...	...	6 per cent.
Potash	...	...	39.22
Lime	...	...	4.24
Phosphoric acid	...	...	14.55
Magnesia	...	...	6.47

The moral of the above, drawn by Mr. Joseph Cripps, the well-known analyst, is as regards manuring as follows:

- (1) Use plenty of lime, but unless there is abundance of humus, only as carbonate.
- (2) Where potash and phosphoric acid are deficient, in top soil deep cultivation will bring them up again.
- (3) Phosphoric acid, potash and nitrogen are the three chief things, besides lime, that are wanted.

PLUMP AGAINST A BIG FACT.

It is not properly any part of my business to enforce lessons in ethics; therefore I commonly leave that responsible task to those whose vocation it is. But no man can continually write on the subject which constitutes the burden of these essays without now and then running plump against a mighty fact in morals. If you will be good enough to read the following short letters I will then try to show why I was moved to speak as I have spoken.

“My daughter Annie Jane,” writes that young girl’s mother, “now five years of age, was a fine healthy child up to March, 1891, when she began to sicken and fall away. She had no appetite and every particle of food she took came up. She lost strength rapidly and within a fortnight she was thin as a rake, being not much else than skin and bone. For days and days she laid in a half-conscious condition, scarcely moving hand or foot, and to all appearance lifeless. I had a doctor attending her for four weeks, and he said the child was suffering from indigestion, yet, so far as we could see, his treatment had no effect. My husband and I, and all that saw the poor baby, thought she was slowly dying, and we were almost heart-broken at the thought of losing her.

“Nothing that we gave her did the slightest good; and the child was fading away, when one day, towards the end of April, a lady called, and after seeing Annie Jane, advised us to use Mother Seigel’s Syrup. She said she had known the lives of many children saved by this medicine who were down with the same complaint. I hurried to get a bottle from Mr. Routly, the chemist, in Susan’s Road, and began giving it in small doses. In less than twenty-four hours the child began to eat, the sickness stopped, and we could see a change for the better. We kept on giving the Syrup, and in two weeks Annie was well as ever, and fast getting back her flesh. Since that time—now four years ago—she has never been ill. We consider that Mother Seigel’s Syrup saved her life. You can publish this statement and refer anyone to me. (Signed) Mrs. Annie Alexander, 35, Melbourne Road, Eastbourne, August 1st, 1895.”

“My son Joseph,” writes Mr. Joseph Bond, of Salter’s Green, Mayfield, Sussex, “was never strong. He did not come on like other children. He was weak, sickly, and puny. He ate but little, and was usually in pain until he vomited most of it up again. Nothing gave him strength. In February, 1894, his feet and ankles began to fester. Next three abscesses formed on his neck and under the chin, making deep holes. He was merely skin and bone. The abscesses seemed to be exhausting his life’s blood. He was in a doctor’s care five months, but got no better. From July (1894) he had four months’ treatment at the Tunbridge Wells Hospital without benefit. The doctors gave him medicines and cod-liver oil, but nothing strengthened him.

“In December (1894) I concluded to take the case into my own hands and gave him a medicine that had cured my wife—Mother Seigel’s Syrup. To our astonishment and delight he began to improve in a few days. He could eat, and was stronger for it. We kept giving him the Syrup, and he grew better every day. The abscesses soon healed, and he is now a fine healthy boy, nine years old, and strong for the first time since he was born. Publish this letter if you wish and refer inquirers to me. (Signed) Joseph Bond, July 26th, 1895.”

What, now, is that mighty fact in morals? Ask yourself the question. What justice was there in the suffering of these two little children? For whose sake was it? Why do the majority of the human race die in infancy and childhood? That bundle of laws and forces called “nature” has no pity, no mercy. Obey and live; disobey and perish, that’s the whole story.

Then how does Mother Seigel’s Syrup cure? It cures by bringing the diseased and suffering body back where nature’s hand can reach it. *It puts the derailed coach back on the rails, it re-launches the stranded ship.* The radical trouble of both Annie Alexander and Joseph Bond was of the digestion, the first (a mere baby then) having been seized with acute indigestion, and the boy having, as his father tells us, been born with a feeble stomach. Hence, in his case, the bad blood and the abscesses by which nature sought to remove it. Will parents take warning from these instances? I hope so. Watch the little ones and use Mother Seigel’s Syrup whenever you see them inclined to droop or languish.

MARKET SUPPLEMENT.

SATURDAY, JANUARY 23, 1897.

COFFEE.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending December 30th, 1896, says:—The Bank rate remains at 4%. Bombay Exchange closes at 1s 3 $\frac{1}{16}$ d. Brazil Exchange 8 $\frac{3}{8}$ d. Rupee paper 3 $\frac{1}{2}$ % 63 $\frac{3}{4}$. Silver 29 $\frac{1}{4}$ d per oz.

The fortnight under review contained only one day of Public Sales when the market was quiet without any material alteration in prices. Fine qualities are scarce and realize good prices, whilst other descriptions are neglected. Brazil markets are steady.

Daily receipts have averaged 11,357 bags in Rio, and 12,643 bags in Santos.

Futures have advanced 1s 9d owing to reduced receipts in Brazil, and a report from Rio of excessive heat and want of rain, but the market closes weak, a shade under the highest, viz.:—Good average Santos in Havre, March delivery closes at fcs. 62.75, in Hamburg pf. 51 $\frac{1}{4}$, and No. 7 low ordinary Rio in New York \$9.70.

To-day's London official quotations are:—

	Jan.	March	May	Sept.
Rio ...	48/-	48/6	48/6	—
SANTOS ...	51/3	51/9	52/3	53/-

We quote:—

Ceylon, mid. to good mid. 104/@115/	Costa Rica, mid. to fine... 93/@107/
Do. small to low mid. 87/,, 102/	Do. ord. to low mid. ... 77/,, 91/
East India, mid. to good mid... 97/,, 106/	Jamaica, good to fine ord. 71/,, 80/
Do. small to low mid. 87/,, 94/	Do. greenish to fine colory... 88/,, 122/
Guatemala, mid. to fine... 92/,, 105/	African ... 43/,, 45/
Do. good ord. to low mid... 74/,, 91/	Columbian, ordinary ... 66/,, 71/
Salvador, good ord. foxy greenish... 72/,, 73/	Do. good ord. to low mid... 72/,, 91/
	Do. mid. to fine... 92/,, 105/

Receipts in Brazil compare as follows with previous years:—

	1896-97.	1895-96.	1894-95.
	Bags.	Bags.	Bags.
Rio ...	2,173,000	1,588,000	1,468,000
SANTOS ...	3,580,000	2,369,000	2,761,000
	5,753,000	3,957,000	4,229,000

Movements of Tea in United Kingdom from 1st Jan. to 30th Nov., as shown by Custom House Returns.

Indian. The only sale held this week consisted of 7,389 packages brought forward on Monday. These were mostly sold with good competition but without change from last week's rates. Some good Teas from Assam were represented in the auction. The following averages may be mentioned:—"Empire of India and Ceylon Tea Co., Sonajuli," 1/1 $\frac{1}{4}$; "Debrooghur Combination Co.," 1/1; "Castleton," 1/0 $\frac{1}{4}$.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of December 23rd, 1896, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1896-1897... 941,308 packages.	646,787 packages.	23,471 packages.	
1895-1896... 912,429 "	555,783 "	31,062 "	
7,389 pks. INDIAN	Total 23,342 packages were offered in public auction this week.		
15,953 " CEYLON			
— " JAVA			

Figures compiled by the Custom House, showing the imports, Home Consumption, and export of Tea from the commencement of January, are given below.

The progress thus shown in the Home Consumption of all Tea is encouraging, especially so in regard to Indian and Ceylon Tea, both of which show very substantial increases over the quantities previously taken. The falling off in the use of China Tea on the other hand is very marked.

The export of all Teas shows a slight increase.

Comparative prices of Indian Tea in London:—

PEKOE.	(Blackish greyish, some tip, inferior liquor)	... 5½d	5¾d	7¼d	6¼d

Ceylon. Tuesday's auction comprised 15,953 packages. Bidding was not very animated and quotations were rather below last week's prices, the slackness in the bidding being probably caused by the near approach of Christmas and the difficulty of reselling the Teas so near the Holidays. The quality was partially responsible for some of the lower quotations, as well as to some extent for the fall in the average price.

Average for week 7½d. against 9d. for same period last year.

Comparative prices of Ceylon Tea in London:—

		1896.	1895.	1894.	1893.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, FEBRUARY 6, 1897.

[No. 3.]

MANAGER'S NOTICE.

Back Numbers: A few odd back numbers of 1896 for sale at four annas each.

Back Number Wanted: One copy of No. 16, for which one rupee will be paid.

Offered: A few back numbers of 1896 at eight annas per copy.

N.B.—It is particularly requested that the names and addresses of the *senders* be legibly written on the covers of the papers despatched.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 19th February 1897.

S. E. Wynaad. PUNDALORE, 3rd February.—*Weather.*—By day it is very hot; at nights cool. *Crops* completed. *Plant-diseases.*—Leaf-disease passed off. *General Health.*—Good. *Labour.*—Fair. Grain pretty cheap.

South Wynaad. SULTAN'S BATTERY, 30th January.—*Weather.*—Has been fine since beginning of month and no rain. *Crops* nearly completed, in most cases under

the estimate. Stripping and pruning going on. *Plant-diseases.*—A little leaf rust on some parts of old coffee. *General Health.* Just beginning to get unhealthy, and several coolies down with fever.

Central Travancore.

PEERMAAD, 30th January.—*Weather.*—Fine and dry with very little wind. No rain at all this month. *Crops.*—Tea as usual at this time of year not flushing much. Coffee crops rather below estimates. *General Health.*—Good. *Labour.*—Sufficient, but more coolies would be advantageous.

Coorg.

POLLIBETTA, 2nd February.—*Weather.*—Fine with east wind on some days, but there were a few days when there was hardly any perceptible wind, and yet no clouds. There were passing clouds from 20th to 22nd ultimo. It is getting hot. *Crops.*—Mostly all gathered, but gleaning is going on. *Labour.*—Plentiful. *General Health.*—Still some bowel-complaints and fever about, but there has been a decided improvement.

Nelliampathy.

1st February.—*Weather.*—Very hot in the middle of the day and very little wind; land wind seems lost. *Labour.*—Most estates have paid off, crops being light (nearly as light, but not quite, as the U. P. A. report makes out, 4 edingalies from 3 acres!); work was early finished. In openings there is still lots to be done, and Malabar labour still to be had freely. Pitting has this year been carried on very late and only this week has it stopped on account of the hardness of the ground. *Plant-diseases.*—"Leaf" is bad on a few young places, but for the most part it is where the pitting has been bad, it would seem. *Health.*—Fair: not more sickness than is to be looked for here at this time of the year. *Roads.*—Still in their usual disgraceful state, and the general topic of conversation is about who is to be the next to fall through a bridge! We have had the Cochin road "boss" up, but, although he has spoken nicely—I am afraid its like the proverbial new broom,—only it won't last so long!! *Water.*—There remains a fair quantity yet, but for how long there will be is the question. Scarcity of water is the bane of the district, and it is very creditable, being as it is, that the consumption of *aqua fortis* is not larger!!

PHELPS & CO., Fashionable Tailors and Costumiers, 16, Old Court House Street, Calcutta. (Ladies' Department: 4, Russell Street.)

Nilgiris.

SHOLUR, 1st February.—No rain during month: highest and lowest temperatures between 6 A.M. and 6 P.M. since last report 72° and 42° respectively. Pruning and hoeing in full swing and cold weather repairs in hand. Health good and labour plentiful.—Ragi 14—25 seers per rupee at Sholur village.

COONNOOR, 4th February.—Weather.—No rain save a few cents some ten days ago or so. Bright hot days and cold nights. Very mild cold weather this is proving. Crops.—Coffee backward in parts and wants rain to ripen up; but spike being very forward, its just as well its keeping dry. Grain still unduly high. Tea flushing poorly and pruning well on everywhere. Outturn of parchment to ton much better here than at Kotagiri this year, in one case as high as 93 b to the ton. Plant-diseases.—Late go of leaf-disease doing a lot of damage to this year's bearing wood. Red spider on tea beginning again. Porcupines doing lots of damage on tea, brutes! General Health.—Indifferent. Labour.—Ample.

GENERAL NOTES AND ARTICLES.**THE ADMINISTRATION OF TRAVANCORE.**

If it is an advantage to an individual to be taken at his own estimate as regards intelligence and worth, it is an advantage also for a State to be taken at the valuation put upon it by its chief officials, the men whose reputations are made or lost according to the apparent success or failure of their administration of public affairs. This advantage has fallen to Travancore. Officials have cried it up, and the few men who have cried it down, have themselves been cried down as "agitators," as men who are consistently "ag'in the Government;" almost, in fact, as rebels. Officials have reported on the excellence of the Administration; and what the Brahman official has set down in reports, the British Resident has usually been quick to endorse. Let it be admitted, too, that the modicum of truth so essential to the success of tactics of this kind is not wanting in Travancore. Several matters might be mentioned in regard to which Travancore is fully abreast of the times. To bring these to the front, to slur over things that reveal a less progressive policy, and to keep out of sight all that points to retrogression or even to an absence of progress—this is the art of the Brahman official, and the British Resident has usually praised all specimens of artistic work of this kind that have been brought to his notice. Nor is this all that has caused the Government of Travancore to acquire high repute as a progressive Administration. For men who might have spoken with weight against it have been for the most part silent, content not to grumble when they were powerless to amend, not to remonstrate where the remonstrances of their fathers or their predecessors had not been heeded. Indeed, such adverse criticism as the Travancore Government has received has been from extremists, and the obvious exaggerations indulged in have not merely deprived this criticism of weight, but have even had a tendency sometimes to make it tell in favour of the very Administration it was aimed against.

It would be pleasant to think that this state of things was about to be changed. We would gladly see some of the light of public criticism of the highest kind thrown on "The Model State;" and even though there is little indication that this will occur, except as a mere accident, so to

speak, we are glad to note any informed criticism that tells us that the optimism of officialdom in Travancore is delusive, just as the pessimism of prejudiced critics is misleading. An instance of this kind of criticism is to be found in the report of the annual meeting of the Central Travancore Planters' Association, given on another page. Mr. GRANVILLE L. ACWORTH, the Honorary Secretary, should, from his knowledge and experience as a planter, be able to weigh the "pros" and "cons" of arguments concerning Administration in Travancore as well as most officials and better than any 'outside' critic. For a long time the Association to which he belongs has been silent about the broad question whether the local Administration is good or bad. As Mr. ACWORTH remarks the matter has been regarded as rather outside the province of such an Association. And this rightly. But circumstances have so far changed that there is now a risk of prolonged silence being misinterpreted. Communications to the Press have taken such a form that further silence would involve a tacit expression of approval of the Administration on the part of Mr. ACWORTH himself, and perhaps his Association also. Realising this, Mr. ACWORTH has spoken, and there is no trace of an effort to run with the hare and hunt with the hounds in the moderation he displays in his handling of a delicate and complex subject. The main trend of his remarks is to show that while Travancore is not as well administered as it has often been represented to be, and as official reports would lead all the world to believe, the condition of affairs is not absolutely hopeless. Past silence must not be taken as pointing to satisfaction with the way in which things have been, or are done. Present speech states plainly that in regard to several matters Mr. ACWORTH, personally, is very far from satisfied; and while it cannot be expected that every planter in Travancore shall take precisely the same view of matters as the Honorary Secretary of the C. T. P. A., it is probably safe to assume that he has the majority on his side.

Defects in the administration are more hinted at than pointed out in Mr. ACWORTH's remarks. The present Dewan, we are told, is no worse and no better than the generality of Dewans of Travancore. Mr. ACWORTH evidently thinks it a mistake to select Dewans locally; but this is a point about which there must necessarily be great difference of opinion. What is mainly urged is that Travancore is a country that is undeveloped. The large annual surplus shown in accounts is not utilised for the further development of the resources of a resourceful State. The financial test alone is the test by which each Administrator seeks to be, and is, judged. A deficit would be taken to mean maladministration; a handsome surplus is conclusive proof that things have been well managed. And then, there is a preponderance of Brahmanism: the ultra-conservative Brahmanism of "the old school." These and other defects are sketched into Mr. ACWORTH's outline (for it is little more than a sketch) of critical observations. To those who have studied Travancore reports without prejudice and watched the progress of affairs in the State with interest, there is clearly truth in what is said. It need not be said that all official reports are too highly coloured, nor yet that writers like those referred to by Mr. ACWORTH as having praised the Administration, or admirers like Baron von ROSENBERG, of Nor-

PHELPS & CO., Calcutta, have probably the largest and best assorted stock of Woollens in India and will be pleased to send patterns and form of self-measurement.

SHORT ADVERTISEMENTS.

NOTICE.

THE cost to subscribers of short advertisements is One Rupee for every three insertions of five lines or less. To non-subscribers a charge of Two Rupees will be made.

N.B.—Advertisers should state exactly the number of insertions required, failing this the advertisement will continue running until stopped and will be charged for accordingly.

OFFERED.

European Dairy. Oaklands Coffee Estate Dairy, 600 acres, with good grazing. To open 1st March 1897 under European management and with the latest machinery. Quality under strict guarantee. Butter Re. 1 per lb., including Freight charges. Orders now being registered.

J. PARTRIDGE,
PROPRIETOR,
Cantonment, Bangalore.

Coffee Shade Tree. Sun-dried Erythrina lithosperma contains per ton:—
61.50 lbs. Nitrogen
57.38 „ Potash
14.92 „ Lime
13.68 „ Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis. Price Rs. 3 per 1,000.

This variety is the only thornless kind extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE,

SHENCOTTAH;
Tinnevely.

Razors. The undersigned undertakes to turn out old razors as good as new, i.e., with the perfection of a keen cutting edge guaranteed, for a small charge of eight annas and upwards, according to quality and temper of steel. The undersigned is importing the latest machine for this purpose.

The minimum charge will however be Re. 1 on each parcel of razors, postage extra. Do not allow any Native barber or knife grinder to touch your razors. They almost invariably spoil the temper, and although they may put on a keen edge, it will only last for one or two shaves.

A. R. ROSLING & CO.,
MILLER'S ROAD,
Bangalore.

SOUTH COAST OF ENGLAND.

St. Leonards on Sea, Ancaster House.

English Education.

The Rev. Frank R. Burrows, M.A., Trinity College, Oxford, receives Boys to prepare for Public Schools and Royal Navy. Ages 7 to 14. High and healthy situation, home comforts. Terms 50 to 70 guineas per annum. References kindly permitted to, and particulars to be had from, C. A. Martin, Esq., LL.D., Darjeeling, and Lt.-Col. G. C. Dobbs, I.S.C., Commissary-General, Bengal Command, Naini Tal.

A Level.

FOR SALE.—A level by Troughton and Simms, in case, with tripod and levelling staves.

Complete and in good order. Price Rs. 300. Open to a reasonable offer.

Apply "AJAX,"

Five.

C/o Editor, *Planting Opinion*.

Coffee Estate.

FOR SALE.—A valuable Coffee Estate, in a good district, 100 acres in bearing, 25 young, 55 acres now being opened, 300 acres forest.

Apply Et. L.,

C/o Editor.

u. c.

Tea land, &c.

Tea land at high elevation, also coffee land, for sale, or partnership to open. Particulars to

T. C.,

Editor of this Paper.

u. c.

Eucalyptus Preparations.

Eucalyptus Boiler Disincrustator at 12 annas per gallon in 40 gallon barrels.

Eucalyptus Oil at 3/8 per 27 oz. bottle.

Apply T. BROWN,

"Glendale," Coonoor.

Saddle.

FOR SALE.—A good saddle and bridle by Parsons, St. Martin's Lane. Used only once—imported last year. Can be seen at Mr. Lexevich's Agency, Bangalore.

PERCY W. WOOLLEY,

Nellacottah.

u. c.

Coffee Land.

FOR SALE.—On easy terms, a block of 1,000 Acres of land in Wynaad, suitable for Tea.

Apply "SOUTH,"

C/o Manager, this Paper.

Coffee Land.

FOR SALE. A BARGAIN.—A block of 210 acres of good Coffee Land in the Nilgiri District, planted with 20,000 4-year old coffee trees. No difficulty about labour. Grazing plentiful. Manure 1 a. per bushel delivered.

Apply to "BARGAIN,"

C/o Editor, P. O.

u. c.

Good Land.

FOR SALE.—Block of 1,000 acres, situated in the best district of Wynaad for the early showers; average annual rainfall 80 inches, with an average in January, February and March of over 5 inches.

Government Road from Coast to Mysore bisects the Property which is moreover bounded on the North and West by large rivers, each containing ample power throughout the year to drive Overshot Water Wheels.

The greater portion of the land faces North, North-East, and North-West, with a very easy lay, and the soil is admirably fitted for the growth of Arabica and Liberian Coffee, as well as of Tea. For further details apply to 303, C/o MANAGER, *Planting Opinion*.

u. c.

WANTED.**Wanted at once.**

A trustworthy Writer for a small estate near Gudalur. Must understand Check Roll and Accounts and write neatly.

Apply in own handwriting to

Apply "PLANTERS' LIBRARY,"

C/o This Paper.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better or in want of a manager, assistant, or writer, &c., is entitled to insert advertisement to that effect free for as long a period as desired. The advertisements will appear on this page. Non-subscribers will be charged the small fee of one rupee.

There are so many cheap imitations of Ellwood's helmets in the market that it is a comfort to know that PHELPS & CO. keep Ellwood's only.

Travancore, and Messrs. FINLAY, MUIR AND Co., of Calcutta, have not written conscientiously. But the letters in the *Opinion* are redolent of the Residency and of officialdom, and for the rest, both sides of the case are deserving a hearing. It would be impossible to weigh or sift the evidence here, and to arrive at a sound judgment we should have to travel far beyond the records cited in Mr. WORTH'S speech on this article. It is sufficient for the present to note that the "fair seeming" of the Administration of Travancore is under suspicion of being only a sheer. It would be well were planters to assist, by calm statements of fact and authoritative revelations of abuses and defects, to bring the actual truth to light, and thus to induce the Government to overhaul its machinery and adopt an improved system of administration.

Binding covers.

In answer to numerous enquiries for special binding covers for Vol. I. *Planting Opinion*, we may point out that these can be obtained from our printers, Messrs. Addison & Co., Madras. Details of prices, etc., will be found elsewhere.

Substitute for jadoo.

A reader gives it as his experience that jadoo fibre is superfluous in nurseries, as very astonishing results are got from a bedding of thatching or lemon grass covered with a mixture of rich mould and friable soil, when percolation is perfect. It does not unduly force germination.

Freights in Ceylon.

Last year's rates dropped to the lowest on record, some weeks being as low as 7s. 6d. per ton to London. The average for tea-freight for the year was of course a great deal higher, being 12s. 6d. per ton, or almost twice as low as in 1891. Freights to Australia still continued high, being as much as Rs. 40, or 1 anna per lb. of tea.

Notes on pests.

We have just received from our London agents a few copies of Miss Ormerod's Reports on Injurious Insects with methods of prevention and Remedy. Thoughtful planters should be able to extract a good deal of useful information from Miss Ormerod's valuable notes. The pamphlets are some 100 pages in length, and can be obtained at Re. 1-8 each from this office, postage extra.

Cinchona tenders.

We recently pointed out how undesirable it was for Government to effect purchases of cinchona bark by private treaty, instead of inviting tenders. We are now glad to learn that, acting upon a representation made by the U. P. A. S. I., the Madras Government has decided to authorize the Director of Government Cinchona Plantations to invite tenders for such quantities of bark as may from time to time be required to supplement the yield of the plantations. No guarantee will be given as to the quantity annually required, and the prices which will be sanctioned.

Bangalore Dairy.

Mr. Partridge, an irrigation planter of Doddballapur, near Bangalore, is striking out a new line in planting in starting a first class European dairy in conjunction with his other business. He asks us to notice the enterprise, of which an

advertisement gives fuller details, and hopes his brother planters will support him by giving him their custom. Good butter is certainly a very difficult thing to obtain at reasonable prices, and if Bombay butter—which should be tabooed till the plague dies out—can reach Coonoor in excellent condition at the low price of one rupee per pound, there is no reason why Mr. Partridge should not do as well in Bangalore. Good grazing, the latest machinery, and skilled European supervision can do a great deal: witness the excellent Sliev Mor dairy at Ootacamund. We wish Mr. Partridge all success, and hope the planters of Mysore and Coorg will support him heartily.

Gum kino.

A correspondent recently enquired as to the best methods of extracting this gum. The following extract from Dr. Watt's Dictionary of Economical Products should give the information required:

This species yields the gum kino of European Materia Medica. The gum as it exudes has the appearance of red currant jelly, but hardens in a few hours after exposure to the air. It is obtained as follows:—"A perpendicular incision with lateral ones leading into it is made in the trunk, at the foot of which is placed a vessel to receive the outflowing juice. This juice soon thickens, and, when sufficiently dried by exposure to the sun and air, is packed into wooden boxes for exportation" (Hanbury, quoting Cleghorn.) Dymock states that in the Kanara District of Bombay it is collected in little cups made with leaves, and consequently assumes the form of concavo-convex cakes 3 to 4 inches in diameter. These are said to be always broken up and garbled by the wholesale dealers. The supplies are chiefly obtained from the Government Forests in Malabar, permission to extract the drug being granted on payment of a small fee and on the understanding that the tapping be performed skilfully and without damage to the timber.

Illustrations—a new departure.

It had long been a wish of ours to have occasional illustrations in this journal, for illustrating new species or varieties of plants, and reproducing designs of buildings, maps, etc. We are glad to announce that we have now made arrangements to undertake such work, and hope it will be the means of rendering these pages of greater use than ever. We shall not, however, confine ourselves entirely to the severely practical, but shall be glad now and then to reproduce landscapes, pictures of local interest, such as figures of local tribes, and so on. Any help such of our readers who have taken up photography can render us, will be gladly welcomed. In the case of photographs, it is not absolutely necessary that the negative itself should be sent, providing the print is a *clear and distinct one*. In either case the original would be returned intact after use. Something in the way of a description of the picture would add greatly to its interest.

Orange-growing in Coorg.

A correspondent writes:—"In re orange-cultivation in this district, I know of no European in the country who has gone in for the systematic culture of oranges with a view to profit. A few trees are planted about bungalows and perhaps a road or two, and the fruit gets mostly wasted. Much of it is eaten by the coolies to the detriment of their health.

"I don't suppose the cultivation would cost much as I have seen trees bearing profusely without the least attention being paid to them. Especially, one disadvantage about the trees is that they bear during the monsoon; but

it must be remembered that it is then very hot weather in Madras and other places where the fruit would be much appreciated. Natives grow the fruit and sell it to merchants and others who export it; but I don't think that they go in for its systematic culture on anything like a large scale."

Black bug.

For the past two years many Coonoor and Kotagiri estates suffered severely from a bad attack of black bug that suddenly appeared on both coffee and tea, especially coffee. In one case a young extension at Kotagiri was dreadfully damaged, over 2,000 young trees being actually killed out by it, and many more being left very shaky. Curiously enough, since last December, the bug seems to be going off as rapidly as it came on, and this without any application whatever. A correspondent suggests that Mr. Brodie's recent letter on the success of his "cure" is probably explained by the simultaneous disappearance of the pest on untreated estates in the neighbourhood. This again is held, by a Kotagiri planter, to be principally due to the ravages of a parasite that feeds greedily on the bug, probably of the same description as that noted by Mr. Newport on the Lower Pulnies. Will the Kotagiri planter referred to kindly give us details of his discovery?

Planting statistics.

Alluding to the article in our last issue under this heading, a valued correspondent states that the figures furnished to the South of India Enquiry Committee are, for the Nilgiris, as follows:

Coffee	...	...	...	24,570
Tea	...	...	...	6,015
Cinchona (exclusive of Govt. Estates)	...	...	...	6,796
				<u>37,381</u>

There is, besides, probably a considerable extent of small native holdings not included in this return. South Mysore has 39,000 acres under coffee, of which 15,000 acres are owned by Europeans and 24,000 by Natives. By the way, the reason why South Mysore statistics did not appear in the U. P. A. appendix was owing to the change of Secretaries, the necessary forms from this district having been filled in and sent many months ago. We regret these figures were not available to us when our directory was published.

A Coonoor firm.

Among the firms who have so largely contributed to the welfare of this rapidly expanding town, "Lee's Pharmacy" (known before as the Nilgiri Pharmaceutical Company) occupies a high place. When Mr. Standish Lee took over the business in 1893, its reputation was at a very low ebb, but by perseverance and any amount of "go," the new proprietor—who is also manager—has effected a very considerable change for the better. The medical stores, which under the former régime were very musty, are now renewed direct from England every three months, and the quality is undoubted. Besides the pharmacy business proper, most Nilgiri planters are familiar with his excellent soda water, and quite lately he has commenced to lay in a stock of tinned provisions of all kinds, which cannot fail to be a great convenience to his customers. We cannot conclude

without remarking on the encouraging way in which he has helped to foster the latest Nilgiri planting industry,—jam and condiment making. This enterprise was only started a few months ago, but the run on the fresh Nilgiri jams and preserves has been most gratifying, and we hope in the course of a few years more that Nilgiri preserves will be known and appreciated from one end of India to the other.

Value of manure analysis.

To illustrate the unwisdom, put it very mildly, of buying manure without a guarantee. Two samples of castor poonac give respectively 7 and 6 per cent. nitrogen. The difference of one per cent. seems a very small thing, but the practical meaning is that fully eight tons of the latter are required to produce the same effect as seven tons of the former. And as ten to one the purchase price per ton would be the same, it means an actual waste of the money spent on the extra ton; and castor poonac is not cheap. Take fish. The proportion of sand varies from 15 (a relatively good sample) to 50 per cent. Contrast two lots containing respectively 20 and 40 per cent. of sand, allowing the same price for both (and how is anyone to know what one is buying without a guarantee?) a man buying the latter when he can get the former, is just paying *twice too much*. The whole system of calculation is a very simple one, when one remembers that, in buying artificials, you want plant food and not sand or fibre for your money. If buying nitrogenous manures, reckon the value on the nitrogen only. If phosphates, take phosphoric acid as the unit. The following formula will be good enough for practical purposes. If one ton of poonac land on the estate costs —rupees, and the percentage of nitrogen is 6, then —rupees $\div (6 \times 22\frac{1}{2})$ = cost per pound of nitrogen. The lower the percentage of nitrogen, the higher the cost per pound. To ascertain the exact comparative values of mixed manures is rather more complicated.

It is enough for the ordinary planter to bear in mind that by insisting on the manure he purchases being up to guaranteed analysis, he will save himself many hundreds, and in some cases, thousands, of rupees per annum.

Cooly law in Selangor.

The following extract is interesting. Says a Borneo exchange:—
We are evidently "quite out of it" in the way of penal legislation for coolies. The Selangor Planters' Association have drafted the following provisions as to plantation thieves which they wish to become law. Just fancy what would be said if the British North Borneo Company adopted these as Territorial law! "Chartered Companies and their attendant brutalities" would be the order of the day. Yet in Selangor if a man be found in possession of unripe fruit, branch, root or stem of a coffee, cardamom or areca nut (worth about $1\frac{1}{2}$ of a cent) he may be sentenced to 3 years imprisonment or \$1,000 fine; or for a second offence a flogging. Talk of the Native States "humane" procedure after that. At home the culprit would be fined 5s.; in this Territory \$1 or a few days' imprisonment at most. We are not of course blind to the nuisance of petty thefts on plantations. But how anybody profits by taking the unripe fruit of the coffee or betelnut or bark, root, or stem of the same passes comprehension. To run a man in for mischief, as we do, is reasonable. But we must confess ourselves more than astonished by the Selangor Ordinance. quote the paragraphs:—

"Every person found loitering or lurking about any plantation shall, unless he can give a satisfactory reason to the magistrate before whom he is tried for such loitering or lurking, be deemed

They have no pretensions to cheapness, nor do they advance any such claims, but PHELPS & understand their business.

To be worked in conjunction with the above, we have established a register, and names will be entered on application, together with copies of their testimonials. Thus should any enquiries be made for the services of a manager, assistant, &c., the names and testimonials will at once be forwarded, saving delay and trouble. Subscribers may have their names entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO.

Field Overseers. Field Overseers from November 1896 in opening new clearing. Salary Rs. 20 to 25 per mensem. Natives only need apply.
Apply to A. H. SHARP, Esq.,
Devikulam.

Coffee Writer. Wanted on a Coffee Estate an Under-Writer who understands field work and accounts. Must be young, active, and willing. Must speak and write English well. A labour connection is necessary. No one without these qualifications need apply. Good salary.

Apply for list.

MANURES.

Steamed Bone Meal.

Fish Guano.

Whole Fish.

Nitrate of Soda 95% soluble.

Trichinopoly Phosphates.

Poonacs:—Ground Nut and Niger Seed, Castor, Hoongay, Mowra.

Sulphate of Ammonia 24%.

Mixtures can be made in any proportion without extra charge. Also packing to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karapuramba Works, Calicut, the Calicut Railway Station, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for Basic Slag or Phosphate, Kainit Salts, Muriate of Potash, Nitrate of Potash, Sulphate of Potash, Saltpetre, Superphosphates of Lime, 15% Phosphoric Acid, Superphosphates 40%, Soluble Phosphates, and any other Manures not kept in stock. Approximate Analyses of these can be had on application.

ilty of an offence, and shall be liable on conviction before such magistrate to imprisonment of either description for any term not exceeding six weeks, or to a fine not exceeding twenty-five dollars.

Whenever the unripe fruit of the coffee or cacao tree, or of tea cardamom plant, or of the arecanut palm, or the bark, whether the branch, root, or stem, of the cinchona tree, shall be found in the possession of any person who is unable to give a satisfactory account of his possession thereof, such person shall be deemed guilty of an offence, and shall, on conviction before a magistrate, be liable to imprisonment of either description for a term not exceeding three years or to a fine not exceeding one thousand dollars, or to both, and for a second or subsequent offence shall also be liable to whipping. It shall not be lawful for anyone to purchase or take in barter, exchange, or receive, any produce from any labourer employed on any plantation.

Any person committing any breach of any of the provisions contained in the 5th section of this Enactment shall be deemed guilty of an offence, and shall be liable on conviction before a magistrate to imprisonment of either description for any term not exceeding six months or to a fine not exceeding one hundred dollars, and for a second or subsequent offence shall also be liable to whipping."

Rhea on the Nilgiris.

A burnt child dreads the fire, and the failure in the experiments carried out some ten to twelve years ago in the Bowani valley and E. Wynaad have the very natural effect of deterring local planters from trying their luck again. The Glenrock Company carried on their experiments from 1885 to 1888, and about 150 acres were planted with rhea in the Bowani valley alone. *Boehmeria nivea* and *B. tenacissima* were both tried, but chiefly *nivea*, as being the freer grower and more easily propagated. The trials made were thorough and exhaustive, and went conclusively to prove that Rhea could not then be grown and treated by Europeans to pay. Machinery of the best kind was tried, worked by water-power; and also by stripping the ribbons by steaming, and the manufacture of the filasse, or clean fibre, with caustic soda.

The chief financial difficulty arises in the handling of the immense quantities of green stems required to turn out, say, a ton of either ribbons or fibre, the latter only amounting to some 3% of the whole.

Again the market in either ribbons or filasse was most unsatisfactory, and very poor prices were obtained compared with what they were led to expect.

The growth of the Rhea presented no difficulties, the propagation being easy, either by seeds or cuttings. Good soil and plenty of moisture enables it to grow readily. Even in those days, however, a big native-managed industry might have flourished, something on the lines in which the silk is produced in Northern India. The "caterpillar plague," noticed in similar experiments in the Wynaad, was not so disastrous as we imagined. The damage done was real enough, but could be successfully prevented if taken in time.

Times are now changed, and if the recent machinery costs but a tithe of what is claimed for it, the Bowani might again be the scene of more experiments in Rhea. The whole situation hangs on efficient machinery, and until a practical experiment has proved its value, Rhea cultivation is undoubtedly a risky venture. One of the most promising of the machines in the market is M. Faure's, a full description of which we gave in our last issue. The cost is

only £36, and the sole agent for the inventor is Mr. Thos. Barraclough, 20 Bucklersquay, London.

Keep your eyes open.

There are many planters who complain of the dullness, the everlasting routine of plantation work, its monotony and generally unintellectual occupations. To a certain extent all this is true enough, but only to a certain extent. On every side there are avenues for original research and experiment, more than enough to give employment to everyone concerned in the industry. Every single detail of plantation work rests on well-known natural laws: how many of those who complain of the dullness of planting have cared to study these laws in themselves? Let us take digging. Why is the land dug at all? It disturbs the roots: does this matter? But digging does good. Yes, but cannot it do more good if done in other ways.

A planter simply following the routine of estate cultivation, jogging along in its deep old ruts, what can he know of half the real and deep pleasure to be derived from "planting as a science." He keeps his eyes shut, and looks neither to the right nor to the left. Such and such work has to be done, and it is his duty to see it done. As to why it is done, or whether it cannot be done better, is a question for others. He cares for none of these things. And yet, poor dull old hack, he complains of the dull unintellectual side of planting! Keep your eyes open, trace the effect back to the cause, follow the ruts only as long as there is no better track to go by. There are great secrets yet to be won on the field, in the factory and in the curing sheds. Some of them are easy to unravel, others require deep and patient investigation. Do not always bear in mind that deadening so-called business motto: what good will it do *me*? Try and do work more for the work's sake. But if you want to put it on a basis of rupees, annas and pies, the answer is simple and practical enough. Every improvement you effect, every useful discovery you obtain, all add to your value as a planter. Yet do not consider the results of your investigations as profound secrets, worthy but difficult of patenting. Give your experiences freely to others, and you are sure to receive many a useful hint in return, which may lead you to yet further success in your trials and experiments. It is against all principles of trade and commonsense to lock up your knowledge in your own bosom. What would the nations of Europe be without their world-wide system of barter and exchange? Not one of them is self-sufficient, each must borrow and exchange from the other. Your bent may lie in pruning, and by systematic trials and investigations you may rightly consider yourself the authority in your district. But are you as perfect in say cultivation, or manuring, or draining, or building? If you are, well, you are not worth wasting printer's ink on. Yet if not wholly eaten up by self-conceit, you will admit that Green can give you points at cultivation, Brown at manuring, and what's-his-name at draining. Offer your knowledge in pruning and see if they don't gladly give of their best in exchange. Some of our readers in favoured districts may think we are combating a phantasm of our imagination. Sad truth to tell, there is more than one district we wot of, where "ideas" are looked upon as patents, and particular methods as important trade secrets.

HELPS & CO. rely on excellence of workmanship and good taste in building up the biggest Tailoring trade in India.

FRUIT CULTURE ON THE NORTH INDIAN HILLS.

SOME interesting facts regarding fruit culture in the hills are given by the Rev. M. M. Carleton in the last issue of the *National Magazine*, published in Calcutta. Mr. Carleton, who is one of the foremost pioneers of the fruit-growing industry in the Himalayas, has made various experiments at Ani, a village in Kulu, 4,500 feet above sea-level and distant 65 miles from Simla. As regards apples, it appears that American and English trees have proved almost a failure. The experiments have now extended over a period of ten years, but though the trees themselves flourish and a few apples are produced, the return is of the poorest. The conclusion arrived at is that apple cultivation will not be profitable at a lower altitude than 6,000 feet. Apricots, on the contrary, have proved a remarkable success. The native tree of the Kulu valley is not very prolific, but the Kashmir and English varieties yield fruit after the fourth year in great abundance. Mr. Carleton strongly advocates the extension of the cultivation of these varieties in all the lower hills; and he suggests the introduction into Simla of the American fruit-drying machines. He believes that enterprising persons could establish a very profitable industry in preparing dried apricots for the Indian markets. American grapes at Ani have done extremely well. Fifteen years ago the Black Hamburg variety was tried, but it turned out a failure. Mr. Carleton, six years later, sent to America for a hardy prolific vine grown on the northern limit of grape cultivation, where the spring opens in May and the frost comes in September. He held that this variety would ripen in Kulu before the heavy rain, because spring begins in the valley early in March. He has now a vine eight years old which yields 70 lb. of grapes. He remarks that a few such vines around the houses of intelligent zemindars in the Simla district would give a handsome return in the local market, especially in the month of June. There can certainly be no question about the great demand for fresh fruit in Simla during the summer months. Experiments with the European orange have shown that the Maltese variety can be grown in the lower hills as high as 4,500 feet. Mr. Carleton thinks a great industry might spring up if the cultivation of oranges was undertaken. From one tree at Ani, eight years old, he gathered 220 oranges last February, which is the month for plucking the fruit, following the Californian custom of leaving the oranges on the trees until the new leaves appear. Snow does not appear to injure the fruit though it affects the leaves. It is pointed out that oranges sold from the Gujranwalla and other gardens fetch from Rs. 5 to Rs. 8 per 100, and it is believed that still higher prices could be obtained for the Kulu fruit in the Simla market during April. If this were so, one tree yielding 200 oranges annually would give the owner a handsome profit, and that on only 10 feet square of ground. It is evident that grape and orange cultivation in the lower hills could be made a very paying industry, but the natives are not enterprising enough to take the matter up. European energy is needed to show them the way, and in the absence of other agency the Forest Department might well step in and give the movement a helping hand. —*Pioneer*, Oct. 3.

THE NILGIRI AGRI-HORTICULTURAL SOCIETY.

WE have received a copy of the Proceedings of the Sub-Committee Meeting of this Society, held at Ooty on the 6th of last month. The show should be a thorough success, if we may judge by the generous list of prizes offered. Flowers of course take pride of place, both as regards the number of prizes (34) and their value (Rs. 113). Vegetables come next with a list of 24 prizes, value Rs. 71; then fruit with 16 prizes of a value of Rs. 59; and lastly farm and field produce, 9 prizes of a value of Rs. 31. Next year, when funds are more

flourishing, we hope to see the value of the prizes for the farm and field produce greatly raised. Out-station members of this Society would, we venture to think, take a great deal keener interest in the Society, were the correspondence alluded to below published either in full, or edited at length. But this again is a matter of finance we suppose.

Read Proceedings of last meeting. Approved. Read paper from General Baker revising the General Conditions and Prize List to show in May, circulated to Members of the Committee. Read letter from Hon. Mr. H. P. Hodgson, suggesting that prizes should be given for products grown in the Districts by ryots. First and second prizes for varieties of Potatoes and also for the best samples of Cooralie, Samai, field Onions and Garlic. Resolved that the prize list and conditions, as amended, with prizes amounting to Rs. 27, be adopted for the show. Resolved that the show be held on Saturday, the 1st May 1897. Read letter from B. Baulyah Naidoo, Esq., offering medal of silver for the best English Pears grown on the Hills, to be called the Havelock Medal, on His Excellency's permission being obtained. The Committee accepts with pleasure, Mr. Baulyah Naidoo obtaining H. E.'s permission for the use of his name. Read letter from L. W. Grey, Esq., of Pykara, asking for seed of the *Pithecolobium Polyccephalus* and stating that the *Pithecolobium Samai* promises to be a good Coffee shade tree, from his own experiments. Read letter from Collector of Nilgiris, 17th December, asking for information re "*Oryza Coarctata*," a wild rice growing in the Sunderbunds and elsewhere. On the request of the Reporter on Economic Products to the Government of India, Mrs. Batchelor forwarded specimens of some of the enemies of Agriculture on the Nilgiri Hills. The grub of the cock chafer, three stages of development, which she considers that it takes three seasons to perfect, before becoming the fly. Also specimens of iridescent small beetle, which does very much damage to vegetables and flowers. Specimens of a minute white wire worm that does much damage in bulbs, especially Lilies. Also specimen of soil impregnated with a white micelium or mildew. Members of the Society are invited to give any information in their power, as to the best means of getting rid of these pests. Members of the Society are informed that Mrs. Batchelor has obtained a larger supply of bulbs, principally Lilies, than she requires, and she will be glad to dispose of some of them at cost price. Members are informed that the Madras Agri-Horticultural Society's Annual Exhibition will be held on 27th February next. Medals and prizes will be given for Tea, Silk, Tussa Silk, the best collection of produce usually exported from Madras, Green Forage, Forest Products, Fibre plants and cleaned fibres, Economic plants, Timber and other useful trees, Medicinal plants, Dyes, Tanning materials, Mordants and the best collection of different varieties of Paddy. The first order for seeds will be despatched on 12th January, but the Hon. Secretary will obtain further supplies as requested.

(Signed) J. W. MINCHIN,
Honorary Secretary.

JADOO FOR PLANTATIONS.

MR. H. PILKINGTON, of Koppa, Kadur District, writes to the *Mail Mail* :—

"I have only recently seen Colonel Halford Thompson's letter which appeared in your issue of the 12th instant. As my name was mentioned therein in connection with Jadoo it will perhaps be better if I give a brief account of what I saw and heard of the fibre recently in Devonshire. My attention was first drawn to it by an article in the *Madras Mail*, and on enquiry in Exeter I found it extensively used by nurserymen and private gardeners. I then paid a visit to the well-known rose growers, Messrs. Veitch and Co. in Exeter, and their foreman showed me many plants growing and doing well in the 'fibre.' He told me that they found all 'soft wood' plants did particularly well in it; also orchids, ferns and crotches and it was most useful for germinating seed in, for which purpose the Jadoo that had been already used in pots answered admirably. I then, on the 11th November last, went to see Colonel Thompson and was taken round his conservatories, hot and orchid houses. East Cliff, Teignmouth, where he lives, no soil is now allowed. Whatever one sees, and there is much to be seen, is growing in Jadoo. I could not have chosen a worse time of year for my

If their representative has not been in your station recently, PHELPS & CO. will be happy to see him—anywhere, from Quetta to Mandalay.

THE MADRAS EQUITABLE ASSURANCE SOCIETY

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ...Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.,)
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} — for payment of death claims.

On Policies transferred to the London Register, death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Draft on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years, at Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

at the conservatory plants were looking splendid and there was a very fine show of chrysanthemums. There were numbers of very sturdy little apple and other fruit trees, growing in ordinary sized pots, then pruned back for the winter, but which had cropped heavily at autumn, as shown me by photographs and verified by Messrs. Leitch and other gardeners. What mostly concerns *Madras Mail* readers, though, is a coffee plant that I was shown. It had been obtained from the Regent's Park Botanical Gardens, in March, 1896, as then four inches high and was transplanted into a six inch pot of pure Jadoo. When I saw it, eight months later, it was in the same small pot, was 19 inches high, and had three pairs of primaries. It had a nice thick stem, and good open bark, and looked like a very good specimen of one year old nursery plant. Colonel Thompson turned it out of its pot for me to see and the very small quantity of Jadoo in which it was growing was full of nice healthy white roots—certainly better rooted than a basket plant grown in earth. I was also shown a small tea plant, then six inches high, which had been grown from seed germinated in Jadoo. It was a healthy looking little plant and had also made good root growth. I was then taken to the Jadoo factory. The 'fibre' found to answer best is 'peat moss litter.' This is boiled for 30 minutes in the fertilising solution and afterwards goes through a process of fermentation. Colonel Thompson gave me the ingredients of the 'solution,' and I can only say they are very simple and contain nothing 'forcing,' though they certainly seem to form an excellent plant food. Later I made further inquiries amongst some of the leading nurserymen in Torquay, and found that they, too, used and appreciated Jadoo. Generally, they told me that plants 'strike' root in it more quickly and readily, and flower earlier, and that as it retains moisture in a very marked way, it is most useful for plants in rooms. I found they generally use it as one part rotting mould to one part Jadoo.

I have not seen 'Toda's' letter; but to get at the cost of Jadoo for a supply basket nursery I examined what was in a six inch pot such as the coffee plant was growing in—and this, by weight, worked out to 1,820 such pots to the ton. Shortly after Colonel Thompson sent me a bushel of Jadoo, and I then tried again, judging as well as I could what would fill an ordinary three quarter size basket, and it worked out to about 1,700 such baskets to the ton. Mixing the ton to an equal bulk of earth would thus give 3,400 baskets, which putting Madras cost at £7, or Rs. 112, and carriage from Madras to Kadur Station at Rs. 11 per ton and carting from Kadur Station to Koppa at Rs. 13 per ton, gives a total of Rs. 136 per ton, say Rs. 140 at the nursery; or about 7½ pies per pot-basket for Jadoo. The cost of preparing an equal amount of jungle soil for mixture is not included in the above figures. But as a set-off to these figures there is the saving in value and carriage of the cattle manure usually applied to the pot-baskets and which would not be needed. I believe on the Nilgiris a smaller basket is used than is usual in Mysore, and if this were done, a considerable reduction in cost as well as in carriage would be at once effected.

Provided Jadoo makes coffee grow, as I believe it will do, both from what I saw and from what vinegrowers have written of it, there are three great points in its favour for use for 'supplies' (1) its richness, and the great probability that a smaller basket will answer, thus effecting a great saving in carriage from the nursery to the estate; (2) the firm, though penetratable, ball which it makes in a pot, rendering planting out easy even though baskets were rotten; (3) its retention of moisture, which would, I think, go a long way to help a 'supply' through its first hot weather as well as helping it forward with suitable plant food. After all, if Jadoo does bring supplies on, the initial cost would not be heavy compared to the annual outlay and disappointment of renewing them year by year. As to manuring old coffee with Jadoo, there is no doubt that the present price is prohibitive. But if a sufficient demand was created the Company might be induced to make it in this country at a very much lower rate. I may add that I am experimenting with Jadoo myself in a small way."

WEEDS AND WASH.

THE following thoughtful remarks appeared in the *Centatta Planter* from the pen of its Coorg correspondent. Though primarily referring to coffee, they are just as

applicable to tea. One of the most useful objects to which the U. P. A. could devote its funds—and it would not require more than a few hundreds—would be to institute an investigation into the yearly losses suffered by preventable "wash" or "waste of land."

The results would, we fancy, be astounding; and if the lessons taught were learnt and digested, the saving in the manure bill would be measured in lacs:—

The exceptionally heavy south-west monsoon through which we passed through last year has taught us a lesson from which it will be our own fault if we do not derive great profit. It is the practice here, and perhaps is in all the coffee districts of Southern India, to wage a perpetual war against weeds and keep places more or less clean; and the consequence is that the "wash," or "waste of ground" as Laborie more forcibly puts it, is something tremendous, and this year it has been especially so. One has only to look into a hollow or a depression in the course of a ravine, or say a tank or a dépôt pit, to form an idea of the harm that is done in a single year; for these are chock full of the most nourishing part of the soil—the "ghee" as one planter forcibly puts it. But no just estimate can be formed of the actual extent of the damage that is accomplished, as tons upon tons of valuable mould are carried away in the streams and completely lost sight of.

It is certain that this sort of thing cannot go on for long without places being as completely washed out as they were about Mercara and down the Ghats. The rainfall being less in the Bamboo than in the above mentioned districts, the destructive process would be perhaps slower, but none the less sure. It behoves all who are interested in the well being of the industry, therefore, to devise means to mitigate this loss of soil as far as possible. Writing with reference to the estates about Mercara and down the Ghats, Simmonds, in his excellent work "Tropical Agriculture," says:—"The slope of the land being steep, it is evident that unless cultivation is carried on with due precautions against the waste of the surface soil, by terracing, draining, or a judicious system of weeding, the trees will in a few years be deprived of the coolest and most nourishing portion of earth, and the land become sterile."

This was verified only too soon. Only a little draining was needed in a half-hearted fashion, and as for the system of weeding being judicious, why it only aided and abetted the waste of the soil, for it consisted of making shallow holes at intervals, scraping the weeds into them and covering them with a light covering of mould, which was washed away with the first downpour of rain, as also the inch or two of soil which the momati had loosened in scraping the weeds.

The solution of the whole difficulty lies in a judicious system of weeding. Some of our most experienced planters, Mr. G. L. Yonge I think among them, were of opinion that hand-weeding should never be done, but that the weeds should be simply hoed in. After 16 years of experience, I find myself in perfect agreement with the opinion that hand weeding should never be practised. One strong reason against it is that the roots should always be allowed to decay in the soil, as this insures a more equable diffusion of organic matter through the particles of soil.

I have found the following treatment of advantage. Grassknives the weeds in heavy wet weather, to prevent them growing into and choking the coffee and preventing the air and light having free access to it. This leaves the roots in the ground and does not kill the weeds, which go on growing and absorbing nitrates which would otherwise be washed into the subsoil and lost. This style of work has therefore the double advantage of binding the soil together and preventing the particles of soil being carried away mechanically by the rain, and also of checking loss in the drainage waters. The cut weeds I have buried in pits at intervals, covering them over with the soil taken out of the pits to prevent loss of nitrogen from decay which the covering of soil accomplishes.

This burying in pits is held by some to be harmful, as it excludes the air and gives rise to fermentation and souring of the soil. These people forget that fermentation and putrefaction take place in the open air, and that fungi seize on all dead plants and animals wherever they may be. They also forget that although these

is so well-known now that Messrs. PHELPS & CO.'s prices, notwithstanding that they are considered high, are so much below those of London, that their trade is advancing by leaps and bounds.

processes taking place in the near neighbourhood of animals is hurtful to them, they are not necessarily so to plants.

Two such weedings and burings would be necessary before the cessation of the heavy rains. After this I have given a fork digging, reversing every spadeful in the spot from which it is taken up, as much as it is possible to get coolies to do it. This turns the roots of the weeds uppermost, and they soon die and decay away. The next growth is usually white weed, and as the weather is by this time dry, they are easily disposed of. They might be lightly chopped and allowed to lie on and mulch the ground, or be buried out of sight.

THE SOURCE OF MALARIA.

ACCORDING to Dr. Bachmann, who writes on the subject in *The Journal of the American Medical Association*, the word 'malaria' is extremely ill-chosen, if the name is to give any clue to the facts instead of representing mere tradition. He insists that observation has clearly demonstrated the propagation of the disease not by 'malaria' (bad air) but by 'malaqua' (bad water); in other words, the malaria germ lives in moist ground and is taken largely into the system with drinking-water. This view harmonizes pretty well with the recent discoveries, described in these columns, regarding the connection between mosquitoes and malaria, for these make it probable that the germ when it leaves the insect finds its way into a human victim with food or drink. Says Dr. Bachmann:

'The germ, which is of soil origin, is strictly a protozoön, and reaches its highest development in low, moist ground with a favourable temperature. Surrounded by the proper soil conditions, this protozoön passes from one stage of life into another with considerable rapidity; so that in the present state of our experimental knowledge, it is impossible to identify it; nor is it probable that by culture we shall be able to produce the accepted Laveran germ outside of the human system.

'As a rule, the potable water from the malarial districts is derived from driven wells not over twenty-two feet deep, in soil with clay or some other impervious substrata, which water is generally cool and palatable, often sparklingly clear, but more frequently a little turbid. This water is filled with an incalculable number of these germs in all stages of development; and if used as a potable water, they naturally find their way into the system through the alimentary channel. This protozoön passes through so many forms or stages of life that in some stages it is light enough to float and be transported by the moist air of low grounds, but in this state it is comparatively harmless except under most extraordinary conditions; it is not until the surface-water is used that the real mischief begins, when, by reason of higher development, it has become much more virulent than that floating in the air. A very short period of incubation is sufficient to develop a severe case of malarial fever in the newcomer who uses the surface-water.

'From personal observation I know that the exclusive use of pure, deep-seated water affords entire immunity against malaria in sections of country where no white man dared live, using the surface-water. Nor must it be understood that the exclusive use of pure water simply fortifies and strengthens the system against the attack of the germ. The water is the primary cause of infection, which acts as the direct carrier of the germ into the system through the intestinal tract.'—*British North Borneo Herald*.

LETTERS TO THE EDITOR.

ENSILAGE: A CORRECTION.

"P. O." No. 2, p. 67.

Will "Agricola" kindly read for "Ham Ham" "Harri Harri" (running jungle grass) and for in "limes" in June.

PHELPS & CO. have often been asked why they don't open a branch in Darjeeling, but for that matter they have been pre- for years past to open at Bangalore, Coonoor, Madras, Rangoon, Lucknow, Cawnpore, Delhi, Mussoorie, and even in Naini but they prefer doing business from their Head Establishment, where the Managing Proprietor can have everything u his personal supervision, and travellers are employed to visit everywhere.

I'm sorry to trouble you and would not do so were it not that I'm afraid my letter as printed is quite unintelligible.

N. S. C. P.

AIR-TIGHT SILO.

SIR,—Your correspondent N. S. C. P. asks how to make "Silo pit air tight"? In closing Silo put on three feet earth tightly rammed, fill in all cracks as they appear. Pl mats on the top of ensilage. Cattle did well on the ensilage some were stall-fed, others fed in lines in the open.

Yours faithfully,
AGRICOLA.

BASIC SLAG.

SIR,—Has anyone used Basic slag as a manure? I see referred to in last P. O. The phosphoric in it is said to be in readily available condition. The considerable quantity of quick lime in it would, I should think, be valuable in shade coffee where the soil is well supplied with organic matter.

Yours faithfully,
SLAG.

PITHECOLOBIUM POLYCEPHALUM.

SIR,—I see you have again printed the extract from the Kew Gardens Bulletin about *Pithecolobium polycephalum*. I wrote Professor Thiselton Dyer of Kew, and have received a reply that seeds could probably be obtained through the British Vice Consul at Medellin. Perhaps you may be glad to have this information.

KARRADI HALLA, CHANNAJNAGAR, }
25th January 1897.

Faithfully yours,
EDWIN C. FOOT.

[Thanks for the information, which we hope to see availed of by some of our readers.—ED.]

PIGS AND TEOSINTE.

DEAR SIR,—In your journal, No. 2 of the 23rd instant, page 46, you say that pigs and porcupines leave the teosinte grain untouched. I had a $\frac{1}{4}$ bigah of land planted with this grain as an experimental measure, and when crop was half grown wild pigs attacked and destroyed a large portion of it. They showed a special liking for the stocks, leaving the leafy portions.

SAIFABAD, HYDERABAD, DECCAN, }
25th January 1897.

Yours faithfully,
MIRZA MEHDY KHAN.

[Our authority for the statement referred to has had some years experience in growing teosinte on the Hills. Perhaps fodder is scarce on the plains.—ED.]

INDIAN VERSUS LONDON COFFEE PRICES.

DEAR SIR,—In your issue of January 9th I see "A like Story" which I have no doubt is quite true, but I'll go one better.

I sold last year one small estate's whole crop in cherries picked half ripe, and very imperfectly dried when sold and delivered for Rs. 11-1 per bushel on the estate; had I sent to Calicut for curing and shipping, it would have turned probably 160 bushels to the ton; but counting it at only 150 bushels to the ton, I netted Rs. 1,659-6, or at the then rate of exchange the equivalent of about £97 on the estate!

I thus saved Rs. 37-8 transport, Rs. 45 coast curing, pilferage on the road, in Calicut and London, and I had my crop marketed at the end of January instead of waiting till June and July, and not lose further by exchange.

WYNADIEN.

WILL LADY-BIRDS LIVE UNDER SHADE?

SIR,—There is one point worth consideration by those who advocate the Lady-bird Experiment. The Lady-bird (Coccinella) is a sun-loving insect, and is seldom found in the shade.

SEEDS AND PLANTS OF COMMERCIAL PRODUCTS.

Tea, Assam Hybrid and Indigenous of high class jats, China Tea, Cacao, best Forastero Trinidad varieties, Sterculia Acuminata (Kola nut), true superior variety, Hevea Brasiliensis (Para Rubber), True Maragogipe, Liberian and Arabian Coffee, Nutmeg, Clove, Cinnamon, Cardamom, Vanilla Planifolia (true Mexican variety), Erythroxylon Coca (large and small leaved kinds), best Sumatra Tobacco, Mangosteen, Sapodilla, Giant Kew (fruit weigh from 10 to 28 lbs. and over) and twelve fruited Pine Apple, E. Umbrosa, Fourcroya Gigantia, Artocarpus Incisa (seedless Bread Fruit), Arnatto, Kapok, Cocoanut several varieties, Penang Areca nut (large), Landolphia Kirki (African Rubber), Teak and numerous other seeds and plants. Price on application. Boehmeria nivea (Rhea) fresh seed Rs. 5 per ounce (about thirteen hundred plants may be raised to the ounce, or say 20,000 per lb.) Erythrina lithosperma, new crop of seed Rs. 3 per 1,000 post free, cash with order.

Touching a shipment of Indigenous Tea seed, an experienced Indian Planter writes us from Madura District dating 24th June 1896: "Just received the Tea seed; it has arrived in perfect condition, notwithstanding unnecessary delay in transit, and does you credit. Please book me for five maunds as early next May as possible."

ve collected coleopteræ for many years and know of five
ferent species found in the coffee districts of Mysore. I have
ways found Lady-birds in open sunny places, on small bushes
creepers, and I doubt very much if they would remain on a
aded coffee estate; but if they did, I think their abode would
in the top branches of the shade trees. In hunting for
etles I have seldom found a Lady-bird on a coffee estate, but
ve at times seen many hundreds on fences in the open, which
d become covered with creepers. It is well known the Lady-
d feeds on aphides, and it would be unlikely to forsake these
blunt its "teeth" on
ADUR, 28th January 1897.

BLACK BUG.

SNAKES ON THE HILLS.

SIR,—In your issue of 9th January there is a most interest-
g record of the "Wynaad" by Mr. Adolphus Wright. In
e "Natural History" paragraph your correspondent talks of
bras, "length from $2\frac{1}{2}$ feet to 9 feet." Mr. Wright must
ve made a mistake, for no cobras have ever been known
approach anything like 9 feet!

One of the largest cobras is now in the British Museum and
asures 6 feet 4 inches—and I think the longest on record is
ly 6 feet 9 inches.

The Hamadryad (*Naia bungarus*), sometimes called Black or
ing Cobra, of course grows to over 14 feet. The "Mundell
awe" (Can.) your correspondent talks of is the Tic-prolonga
Russell's viper (*Vipera russelli*); though of sluggish habits is
e of the most deadly snakes of India. It grows to 4—5 feet.
is commonly supposed that these snakes are not found on
e high hills of South India, which is quite a mistaken idea.
short time ago a Russell's viper was shot on the top of Doda-
tta (8,000 ft.) after it had bitten two dogs. One died in less
an 5 minutes!

MMERGODE,
Mudgiri.

A. M. DALY.

THE COFFEE PROPAGANDA.

SIR,—While looking over some back numbers of *Planting
Opinion*, I came across the figures given by Mr. H. G. Parsons
"The Decrease of Consumption of Coffee in Great Britain"
his speech at the U. P. S. I. meeting of August 17, 1896, and
as very much struck with the decrease, which Mr. Parsons
tributes to two causes: 1stly, the cheapness of tea compared
th coffee; 2ndly, the ignorance of the public in not knowing
w to make a good cup of coffee. In the above-mentioned
eech he very truly asserted that "a good cup of coffee is pre-
rable to a good cup of tea; at the same time there could be
rdly anything worse than a bad cup of coffee."

Mr. Acworth, commenting on the above assertion at the time,
d he really thought that the decrease of consumption of
ffee in Great Britain was more due to the fact of the difficulty
making a good cup of coffee. And if the Planters wanted to
rease the consumption of coffee in Great Britain, they should
scribe a large fund among themselves and send an expert
nd, with a new coffee-pot, through the different villages in
gland, and teach them how to make coffee, just as the ener-
tic and enterprising tea-planters were doing in America at far
eater cost. He (Mr. Acworth) would do it in England, if
y sent him there for £150 a year.

It is recorded that after this speech of Mr. Acworth's there
s laughter. Was the idea looked upon as a mere jest? It
ems to me that the subject is deserving of graver considera-
n, and I am surprised that no abler pen than mine has not
this kept it before the readers of *Planting Opinion*. One
uld have thought so after the article "Coffee Planting in
razil," which appeared in *P. O.* of September 12th, 1896,

page 19, in which the writer says: "Brazilian coffee growers
are taking measures for an active propaganda, one plan being to
establish cafés and permanent exhibitions in Europe, in order
to demonstrate the deliciousness of Brazil coffee when properly
supplied and prepared." I dare say another plan of the active
propaganda will be to "take a new coffee-pot round to the
different villages of England" and teach the people how to
make a good cup of *Brazilian* coffee. Why should they not be
taught, sir, how to make a good cup of *Indian* coffee instead?
Perhaps some of your readers will let us know why.

"CUP OF COFFEE."

THE "IMPERIAL BUSHEL."

SIR,—As a subject of some importance to the planting
community in general, I feel sure that many will be willing to
give the matter I wish to bring before them their consideration,
and I hope that many will give their opinion and experience, and
suggest, if possible, a remedy to one of the many worries we are
subjected to. I write now from practical information and from
no ill will, but to protect ourselves from loss on despatch of coffee
to curers. There seems to me to be no standard measure of
parchment bushels for coffee measurement. There is a so-called
standard, but even then there are conflicting ideas as to the pro-
per capacity of an Imperial bushel, and I should like to know
for one what a Standard Imperial bushel really is? What are the
cubical contents, and being a Standard Imperial bushel, does it
guarantee its measurement being correct? I have a stamped
Imperial bushel *used only for despatch of crop* and bought pur-
posely from a curing firm in order to save the continual annoyance
from the cartmen who were invariably short in measurements.
I fully expected that at last I had secured myself against short
deliveries and paid some rupees twenty for my Imperial bushel,
but what was my annoyance to find that I was still short and a
request from the firm to send my bushel to them for comparison
with theirs. I did this and found that it was just a degree
smaller than theirs, and when I write and complain that I had
bought this Imperial bushel from their firm as a protection to
myself, I am informed that they are exceedingly sorry; but when I
purchased it from them their principal was at Home in England
on leave at the time, and so they had got it for me from another
curing firm. Now what is the good of buying a supposed
stamped Imperial bushel if they are not true in measurement, and
why do they not scientifically prove the measurement before
selling such. This is not all; the following year the same firm
might in the middle of crop provide themselves with a new
Imperial bushel measure and turn things upside down as the
despatch from the estate is woefully short. Contractors refuse
to measure with the new bushel and telegraph up for the estate
one. I send my bushel and crop turns out as despatched by mine
right, but some 3 or 4 short as measured by theirs. This is not,
I should say, helping the planter, but only making extra annoy-
ance between him and the contractors, and it is not business
surely: if they must have a new bushel, they ought to provide
their constituents with new ones also, and if there is to be such
a marked difference in Imperial bushels, it is time that one
standard be struck once for all. I have always found this with
crop despatches, and it is a well-known fact that the coffee is stolen
between the estate and the works in transit, but it would be some
satisfaction to both planter and curer and contractors also if a
Standard Imperial bushel of one standard in measurement were
established, as otherwise it is a case of annoyance all round. I
could not claim anything from my contractors for short delivery
after it turned out correct with my own bushel, and whether it
had been stolen by them is not and made up to my measurement
again by their many dodges en route who knows. The most as-
tonishing part of the business is however that the following year

has been remarked several times that no doubt PHELPS & CO. will raise their prices, now that they
have taken their Ladies' Department to 4, Russell Street, but it is a mistake.

I despatched with the same bushel to the same firm, but by a different contractor, and lo and behold there was not a bean short in a despatch of 168 bushels parchment coffee. My coffee as despatched was from 33 to 34 lbs. and on arrival was some 32½ lbs.

Yours, &c.,
"IMPERIAL BUSHEL."

PRACTICAL EXPERIENCE IN LEGUMINOUS MANURING.

DEAR SIR,—In P. O. of 15th August you published some experiments of mine in Leguminous manuring; and as "Wynaad Bean" in P. O., 9th January, asks that those who have tried the "Legume cult" should publish their experiences, I give you a few notes of what mine have been since August.

In my former letter I made mention of a 12-acre field manured in August and September 1895. The crop was small and I now consider the manuring was done too late, but at present time the trees are looking well and with a good spike. In June—July last year I applied "E. Lithosperma" cuttings to some other portions, and in three months the effect of the manuring was most marked, the trees having made a fine growth. They are continuing to look well and have an abundance of healthy spike. In October I manured another portion and the trees now show the effect of the manure by a nice growth of wood and leaves. The wood will of course not ripen to bear crop, and my experiments show the best time for applying Leguminous manures is not later than July. Their action is so quick that by applying them you get a wood for next year and help your tree through leaf disease.

I last year also manured with both Fish and Cattle manure, and before comparing results I might mention the cost to me of each manure. To cut and apply a good armful of "E. Lithosperma" cost 2 pies per tree. Fish applied at about 1 ton per acre cost 6 pies per tree. Cattle manure two baskets to a tree cost 1 anna per tree. Perhaps I did not manufacture my cattle manure as cheaply as it should have been done, and in calculating the cost I have taken cattle-keeper's pay and cost of applying. The fish was applied in May and the result is much the same as the "E. Lithosperma" manuring. The cattle manure was applied in June and so far the trees show very little appearance of having been manured and the benefit will come next year. The great point in "E. Lithosperma" manuring is its quick effect which proves that all the plant food constituents are in a soluble form and can immediately be taken hold of by the coffee. Those who don't know "E. Lithosperma" would be astonished at its quick growth, and when once established the amount of cutting it will stand. Albizias are not in it with "E. Lithosperma" for growth. The wood is extremely soft, almost pithy, and if instead of the loppings being buried they are left on the ground, they decay and are eaten up by whiteants in a few months, thus improving the soil and feeding the whiteants. While on this point, I believe a remedy for whiteants in tea would be to place a quick-growing Leguminous tree, keep it lopped so that its shade should not interfere with the tea flushing. The loppings would feed the whiteants and they would not then trouble about the tea and the nodules on the Leguminous tree would be supplying nitrogen to the tea. Whiteants don't attack tea in a new clearing, at least this is my experience, but only in clearings which have been opened some years and where the tree roots and trunks have all disappeared. The whiteants having nothing to eat, they attack the growing tea.

If confirmation is wanted that planters are on the right track in using Leguminous manures, I think what native cultivators do is a proof in that direction. In the paddy districts below

these hills the price for a bandy load of such Leguminous plant as "Tephrosea purpurea" (Cassia Auriculata) is Rs. 2 and the are carted miles. For cattle dung the price is 4 annas, but this is never carted except from the house to the field. The native has also found out that Leguminous manures are quick acting and prefers to apply them to his three months' paddy crop rather than to the six months' one.

LEGUME

COFFEE YIELDS AND EXAGGERATION.

DEAR SIR,—I suppose there is nothing more interesting to planter than statistics of yields per acre of coffee in different districts, and I think it would be a good thing if men from various localities on the Nilgiris could be induced to publish what coffee in their respective parts yield, taking the average say of the last 7 or 5 years.

One hears of such miraculous *expected* crops during blossoming time that it strikes one as funny. The *actual results* are not proclaimed with the same flourish of trumpets!! The good impression on the minds of some who hear of these expected fine yields (as each "blooming" season comes round) is a fine way of advertising our tote as I know of, as well as the district in which the tote is situate. Of course to publish the *actual results* in contrast to the expectation would be foolish for the advertiser so to do, inasmuch as a good deal of the guilt would vanish off the proverbial ginger bread. Again it would be nearer the truth to give the yield *per acre* and not the sum total in tons,—80 or 90 tons no doubt sounds a grand crop and 50 or 60 nothing out of the ordinary, but I contend that when (we will say) a 3, or 400 acre estate has given the former crop and 150 or 200 acre estate has given the latter, the bearing is decidedly better on the smaller property; consequently in valuing or purchasing, the yield per acre is the *safest* guide.

A good deal of romancing goes on during picking season. Tom meets Harry, says he has *got in* so much and there's much left on the trees. A look at the agent's receipt shows the difference!! As far as this went, it would not hurt any one, if it did not happen that Harry is a large proprietor who straight away writes to his Manager Dick and draws comparison between Tom and himself. To Harry, as a fellow proprietor I would say, "Verbum sat sapienti." It's only natural I suppose each man to stick up for his district, but that's no reason why any planter should *publicly* condemn another and tell arrant nonsense, for if put to the test he would be unable to verify his wild statements or prove that the yield of *his* district or tote exceeded the one he blackguarded. Now a good deal of this sort of thing has been going on lately, and it may be that district is condemned by a man, *because* he perhaps was once that district, and having made his own tote a failure, vents spleen on the locality.

The Colacumbie district has lately come in for its share of abuse, I hear, hence my taking up the cudgels in its defence. Any one with an unbiassed mind visiting these parts could not fail to be struck with the *solid* looking fields of A-1 coffee. Every district has its poor totes, but these even are conspicuous by their absence, bar one or two at the most. Taking the large properties, they are second to none in any part of the Hills; their yield ditto. Finer coffee than on "Sultana," "Mullay," "Manaar," "Tudor Valley," "Kodamund," "Welands," "Olands," "Colacumbay," "Craigmor," "Glencairn," "Mailoor" could not be seen. The smaller estates also and do proportionately as well as the above-mentioned. It has been proved to me that one of the above-named estates given an average of 4½ cwt. per acre for the past 5 years, an area, which I believe consists of under 200 bearing acres, yielded during season 1894-95, 83½ tons. 75,000 trees on one side

Ladies in the mofussil do not always realize that they can by corresponding with PHELPS & CO. at their Lac Branch at Russell Street, keep in touch with all that is newest and most fashionable in the world.

estate the same year gave 47 tons, or an average of $12\frac{1}{2}$ t. per acre. This is not so bad for this district, which one would not look at" or nearly ruined one, and bunkum and lib" to the same tune!

Yours faithfully,
"PROPRIETOR."

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma contains per ton:—

61-50	lbs.	Nitrogen.
57-38	"	Potash.
14-92	"	Lime.
13-68	"	Phosphoric acid.

Orders booked for the coming crop of seed from the parent trees of above analysis at Rs. 3 per 1,000.

Manager, ARIENKOW ESTATE,
SHENCOTTAH,
Tinnevelly.

COFFEE.

NATURE AND ARTIFICE.

INDIA AND BRAZIL.

WHAT everyone does must be right, for is it not the natured practice of the majority, that body of present day "routine" be, and a world without routine is unthinkable. Therefore, when we note that the practice of "topping" and close planting is universal in South India, as it was in Brazil, we assume it must be perfectly right. It would be interesting to learn in these latter days of scientific planting exactly how far close planting necessitates topping and *versâ*. This is merely by the way. What we wish to mark is the extraordinary differences that prevail in Brazil on these very points. There, close planting is unheard of, and topping equally unknown. The logical conclusion apparently seems to be that both systems are the best possible in their respective countries.

Is this really so? Now Brazil has admittedly a great deal to learn from us in the matter of picking and curing. It is not just possible, that we may have something, a mere thing of course, but just a wrinkle or two, to learn from Brazil? Let us see how the case stands. We do not intend to put cause and effect together, but a rough comparison between the two countries will be of interest. With all our careful cultivation, shading, pruning and manuring, we can show very indifferent results in the quantity of our crops. Leaf disease, like the poor, we have now always with us, and—except in the excellent cases obtained for our coffee—we can scarcely be said to have reached perfection.

Brazil planters have a splendid soil to begin with, no leaf disease, no topping and consequent pruning, and admittedly large crops. The prices, it is true, are very low, but it is at least a question whether the lowness of the rates may not be largely remedied by improved methods of curing.

First as to leaf disease. As a general rule it may be taken for granted that the more artificial the conditions under which plants are grown, the more likely are they to be attacked by disease. Is there not, perhaps, a certain connection between the presence of leaf disease and the

highly artificial conditions under which coffee is grown in India? We make the suggestion with great diffidence, and invite criticism thereon.

Supposing an attempt were made to imitate Brazil methods, the question arises, how about the differences in the soils of the respective countries?

Manuring would of course have to be resorted to, and obviously with fewer trees to the acre, each would receive a larger quantity of manure. Thus the four hundred plants would individually get three times as much as the twelve hundred that now occupy the same space. The expenses of pruning and handling would be almost altogether done away with, while the picking alone would, or might, entail a slight extra expense.

To show that our suggestions are not based altogether on mere plausible theory, may be seen from the following remarks of an experienced and successful planter:

"I intend to try a small field after the Brazilian style, and think it the rational plan, as coffee grows principally on the upper branches and suckers. I have noticed that stumped trees always crop well, and believe that cutting them down every sixth year or so would do well, if the tree were well nourished. I may cite the case of plants in isolated places yielding a large crop."

It may be of still more interest to note what has been already done in a somewhat similar direction.

In 1892 Mr. Phil. Beaver, of Kullakamby, Nilgiris, had occasion to take charge of an old and semi-abandoned estate, of which one field in particular had been given up as hopeless. His experiment, which turned out to be singularly successful, consisted in nothing more than to allow the old trees to spring up again naturally, in other words making "native coffee" out of useless old stumps. In describing the trial at our desire, Mr. Beaver writes:

"In 1892, on taking over the estate, I noticed that about five acres of coffee had been abandoned. In cutting my way through this field (for it had been all overgrown with brambles and brushwood), I noticed that the stems of the abandoned coffee were particularly large and full of vitality. It then struck me that it would be worth while giving the field a good clearing, cutting the stems down to six inches and burning over. This I did, and forked the land after the burning, just before the spring of 1892. About 3,000 stems responded to this treatment and sent up a wonderful growth of healthy suckers. It then occurred to me to let these suckers grow up naturally. So far, 27th January 1897, the experiment has been an unqualified success, and to-day the field is a 'sight for sore eyes.' The 3,000 stumps yielded in:

1893-94	fully	$1\frac{1}{2}$ tons.
1894-95	"	2 tons.
1895-96	"	$\frac{1}{2}$ ton.

For the coming year the suckers are perfectly full of spike, and as the suckers are now fully developed, I look for quite 3 tons.

These yields have been obtained without a pinch of manure. The only work done was a thorough trenching and regular weeding; no handlings, of course. After crop the dry wood was all broken off. The suckers do not die off to an alarming extent, as might be imagined, though after a heavy crop, many do, and the lower primaries die away too, of course, up to a certain height. But I find that new primaries take the place of any that die, and so the stem seems always to have its complement of bearing suckers.

I do not for a moment mean to assert that this field will do well for an indefinite period without manuring; no, I believe manure must be given to keep them up to the mark. I am also planting shade, for I find that wherever there are old "Nagas" or charcoal trees growing, the suckers under them are specially vigorous and stand crop better than those planted out in the open.

Again, I do not in the least wish to suggest that a whole estate could be treated in this fashion, for I am certain that it is only in sheltered hollows and in good soil that naturally grown trees from a good parent stem will do well.

Neither do I think that a fresh field of young coffee allowed to grow up naturally will pay, for each tree will grow into a long whippy specimen. But if an old estate has a decaying field that will not come round in spite of all work and attention, and the said field is in a sheltered aspect, then I say, treat it as I have done my abandoned field. I can guarantee the result will be a happy one. If the trees get in addition a good surface manuring after the forking, the results will be astonishing. I may again lay stress on my opinion, from experience, that shade grown over these suckers will make them last as long as any coffee treated in our usual style. I give these notes with pleasure and hope they may be of interest. It has just struck me that it may be asked if the picking of crop off these long suckers does not entail a lot of damage. I can say it does not. I provide a long crooked stick to my coolies; with these they just bend down the heads of the suckers; if they are held at the head they will not snap off and it's when the cooly begins hauling at a sucker near its connection with the parent stem that it parts company. This is all that has to be looked to in the picking. One more interesting fact. This particular field was abandoned on account of its cold locality. The leaves got "cockled" and the trees never recovered to blossom after a winter. But the suckers growing naturally seem to withstand the effects of cold, and certainly I have not seen a 'cockled' leaf on any of them."

We presume that Mr. Beaver, in his advice not to treat young coffee in this fashion owing to its growing up into long whippy trees, had in his mind the usual close planting in vogue. It is a well-known fact in forestry that the closer trees are planted, the cleaner will be their stems from branches, and if any branches do form, they will speedily die and fall off. Nowhere is this shown more clearly than in the blue-gum plantations on the Nilgiris, and the great contrast afforded between the thin, straight and clean stemmed rows of plantation trees, and the sturdy and branching specimens to be found in the open. We opine that much the same effect would be observed in coffee: the wider the planting, the less likely would the tree be to grow up thin and whippy. More information on this point would be of interest.

Fungus in Mexico.

It seems as if Mexico were not to escape the fate of most other districts in being plagued with fatal pests to the coffee tree. The fungoid disease *Stelbum flavidum*, Cooke, which we believe almost annihilated the coffee industry in Jamaica early in the century, is reported to have appeared in Mexico.

Erythrinalithosperma.

Mr. Nelson lately wrote us that his crop of seed of this grand tree was just beginning to ripen, and that as it would be over about, or before, the end of this month, anybody who wanted fresh seed should apply at once. The seed is a very hard one to get into condition and keep without spoiling. Talking of the difficulties of collecting it, Mr. Nelson mentions that parrots are keen competitors, two and sometimes three men being kept to shoot them.

The interest taken in the plant has been, we learn, extraordinary, and by no means confined to planters. The Bench, the Bar, the Church and Army, all are represented, enquiries coming from districts so far apart as Burmah, Assam and Kumaon.

The Ceylon name.

The reputation that Ceylon has achieved in the plantation world from "China to Peru" is unique, and is due in no small part to its happy geographical position. The skill and enterprise

of its planters is proverbial, but it does seem a little strange that the Brazil Dumont Coffee Company should choose, as they have done, a Ceylon man as manager for their estates. We do not wish to make unkind reflections, but if there is a country where coffee has been more utterly "wiped out" than in Ceylon, we have not yet heard of it. South India is still comparatively unknown at home, and the vastness of its planting industries is minimized by the way in which the various districts are scattered. There is no doubt we want a lot more advertisement than we get, and if we cannot get others to do it for us, we had better take a wrinkle from Ceylon and do it ourselves.

Sumatra.

From an interview with Mr. W. Turing Mackenzie, published in a Ceylon exchange, we note that the climate of Sumatra is a great deal healthier than that of Perak and Selangor, which is very feverish. The Sumatra labour is indentured from Java, and costs about Rs. 12 per man and Rs. 6 per woman per mensem, besides an advance of about Rs. 80 per head. Half of the advance is recovered and half is written off. All the coolies have a kind of passport, without which they are treated as vagrants and imprisoned. Sardang is the coffee district of the island. Some astonishingly large yields are reported, the produce being well over $\frac{1}{2}$ ton per acre for 4 year old coffee!

As to the argument against exhausting the trees, Mr. Mackenzie says boldly: "When nature offers you a good thing, take it." To-morrow "she may give a slap in the face." The present experience of British Central Africa planters teaches a very different lesson on this very point.

Market statistics.

From the interesting table of statistics published by Messrs. Rouse and Co., to be found in our Market Supplement, we note that as compared with 1895 the deliveries last year show a marked improvement, while the stock on the 1st January this year is slightly below that held on the corresponding date last year. Of the principal European entrepôts, Hamburg is easily first, showing more than double the amount of imports of any two of the other ports. London comes fifth on the list. The average price for middling Plantation Ceylon works out to 101s. 4d. for 1896 as against 100s. 10d. for 1895. It is now some eight years since the great rise in prices, and there seems every likelihood—barring the effects of such factors as we drew attention to in our last issue—of a similar range ruling for the next ten years at least. "Good channel Rio afloat" on the other hand shows a remarkable drop of about 23% in last year's prices, the average of 1896 being 58s. against 75s. 11d. in 1895. This again shows conclusively how very little we have to fear from the movements in the common kinds. It is worthy also of note that the Java crops are steadily decreasing, and it will take some many years yet for the Borneo and Straits coffee industry, most Liberian, to stay this decline appreciably.

Improved seed.

Referring to the article under the heading in our last issue, we have to thank friends for two samples of Coorg and Mysore seed, but should be glad to receive more from other districts.

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Richy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Un-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to Common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 10 ft. by 3 ft.

Quotations and further particulars will be furnished by our Tellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS.

Planters' Library.

Please note that purchasers will effect a saving by sending a M. O. or stamps for the price of the books, plus one anna on the rupee for packing. The value payable commission and registration fees will be saved, while the postage being charged bearing (at the same rates as if prepaid) will ensure safe delivery.

"PLANTING OPINION," COONOR.

"Englishman," August 1st, 1896

APPRECIATION OF AN INDIAN MIXTURE

Messrs. CHILD & CO.,

The Wholesale Tobacconists of Chowringhee, are in possession of an autograph letter from Mark Twain.

"Indian Daily News," August 1st, 1896.

Mark Twain left a substantial memento of his visit behind him in Calcutta in the shape of a letter addressed to Messrs. Child & Co., and an old Mississippi pilot knows what good tobacco is, even when he takes to literature.

MARK TWAIN.

Calcutta, February 8th, 1896.

MESSRS. CHILD & CO.

SIRS,—This is the brand I wanted. I have smoked your Honey Dew Mixed in another part of the world, and learned to prefer it.

Truly yours,

S. L. CLEMENS.

CHILD & CO.'S HONEY DEW MIXTURE

Is prepared from the four finest growths in the world, viz:—

Sun-dried Virginia (sweet and mellow), Old Kentucky (flavoured), Turkey Dubec (mild), Latakia (fragrant). All fine matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength

WITH DELICIOUS FLAVOUR.

THE FINEST THAT CAN BE MADE. NO EQUAL

In 1lb. air-tight tins, Rs. 2-8 per lb.

CHILD & CO.,

WHOLESALE AND RETAIL TOBACCONISTS,

MESS AND CLUB CONTRACTORS,

2-22, 2-23, CHOWRINGHEE ROAD, CALCUTTA

GENERAL PRICE LIST ON APPLICATION.

fore having them compared with Mr. Grey's seed. We have again heard from this gentleman, touching on the proportion of moisture in the prepared and unprepared samples described last fortnight. Mr. Hooper in a supplementary report says: "The moisture of the two samples of coffee was in the prepared sample 9.20 per cent. and on the original 10.73 per cent. Making allowance for this water calculating the ash on the absolutely dry coffee berry, the ash only reaches just 3 per cent. This is decidedly low and much below the average yield of ash, which is about 4 per cent. on dry coffee. You have certainly made a discovery." We hope Mr. Grey will not rest on his oars, but will pursue his investigations further. He has already succeeded in producing a bean containing 75 per cent. more ash than the ordinary bean. Let him go a step further, and give us a bean as superior in nitrogen as it is in ash, and lastly let us so treat the seed that it will yield a plant with a constitution capable of defying the worst attacks of leaf disease. This last point Mr. Hooper regards as hopeless, basing his objection on the fact of the disease being carried by means of spores. Yet we think the proposed inoculation would be very practical, and though nothing could prevent the lodging of the windblown spores, it is quite conceivable that the sap of the plant could be so doctored by previous treatment in the seed as to offer no suitable food for the development of the fungus.

But it is better to make haste slowly. Planters have a chance of experimenting with a very superior class of seed, and we hope they will not lose this opportunity. The astonishing neglect of planters in the selection of their seed is one of the marvels of present-day planting. The large extensions contemplated on the Annamalais will, we trust, be made with only the very best seed obtainable.

COFFEE CONSUMPTION: HOW TO INCREASE IT.

AMONG the "Letters to the Editor" this fortnight will be found an appeal from "Cup of Coffee" to his fellow planters to bestir themselves on this subject heading. That the small consumption of coffee in England is decreasing, is as patent as that the great consumption of tea is increasing. Both are used solely and wholly as beverages, and the question arises, why is tea drunk more than coffee? The statistics of the tea trade show beyond any possible doubt that a fall in cost (due to a drop either in price or duty, or both) markedly stimulates the demand. Taking Great Britain alone, there has taken place during the past dozen years an enormous increase in the consumption of tea. Preceding concurrently with this movement, both the duty and price of tea has fallen considerably. Knowing the high prices of coffee during the same period, can anyone doubt that they have not been a considerable factor in restraining consumption? In a very large measure, the question is one of cost. "The man in the street," who is usually the great element to be reckoned with, has not, we fancy, any violent predilection for tea in preference to coffee, or *vice versa*. He wants a hot, refreshing drink, and wants it at the lowest cost possible. He can get more pints of tea for a shilling, than he can of coffee, at present, and naturally takes to the tea. Equally, however, for the coffee planter, the question does

not end here. With Santos coffee in the shilling fifties, our friend of the pavement evidently does not get good value for his money. Why? There is the "middleman" between. This useful, but iniquitously minded individual, requires to be brought to his bearings in much the same manner tea planters have found so successful. "Coffee-pot touring" is all very well, but it wants more than this. Plantation coffee and grocer's coffee are two very different things. The latter is commonly sold ground in powder, ready for infusion, and in that process many curious things happen. First of all; adulteration of the bean itself often takes place. But even if pure, the roasting process is usually vilely done, and the true coffee flavour lost. Last and worst of all, does the shameless mixture, of often 75 per cent. of chicory take place, sold and drank in due course as coffee. And though this vile preparation were as cheap as tea, even "the man in the street" would, altogether apart from the flavour question, detect a notable lack in the exhilaration that should follow after drinking a cup of any decent tea or coffee. It will not be sufficient to supply the consumer with the pure unroasted coffee bean, for, unlike on the continent, practically no one in England roasts their own coffee. So the only thing left is for planters to undertake the roasting themselves by means of a suitable agency in London, and supply it in air-tight tins or packets, with a striking and distinctive trade mark or label. We must not forget the important point of ways and means. If the object is to induce the masses to drink coffee, can our high-priced Indian berry effect the desired result? If, again, American coffee is used for the purpose, is there not a danger of the public acquiring a taste for coffee that is not ours with a consequent fall in our prices? This, we fear, is but too likely, and we must resign the idea of converting the masses, and confine ourselves to the task of winning over the classes. This will simplify operations considerably, and the bigness of the undertaking is considerably reduced. Now as to funds. In a matter of this sort, payment in kind would be found most suitable in every way. It should not be at all difficult to induce one of the large provision dealers to take up the business, if a guarantee were given of so many hundred weight of coffee *free* for a term of years.

Another and more attractive method in some ways would be to start a co-operative roasting and packet factory, owned by planters. There would be initial cost of machinery and buildings, but this need not be very great to commence with. The raw material, the coffee bean itself, would also be supplied by planters, on credit, but not "free gratis" as in the other case. When the coffee was sold, the suppliers would be paid, and, probably, at exceedingly handsome rates.

There is no doubt many a planter will wonder what all the "bother" is about with the present excellent market, and not the remotest fears of over-production to frighten us with. Yet it is a very patent fact that the more we get the English public to appreciate our berry, the greater will be the competition to secure the limited quantities we can offer. The extension of his markets is by no means such a matter of life and death to the coffee planter as it is to the tea-planter, yet there are the two dangers of Brazilian competition and a rising exchange to consider. And even were

these dangers absent, it is a surely sound business to neglect nothing that will tend to materially increase our prosperity.

The subject is a most interesting one, and will bear a lot of discussion, which we trust "Cup of Coffee's" letter and our own discursive remarks will stimulate.

"BEES AND THE FERTILIZATION OF THE COFFEE BLOSSOM."

WITH reference to the notes on this subject by a "local scientist," which appears in your issue of the 9th instant, it would be interesting to know how, if a coffee estate be about the last place to find bees in large numbers, because besides the coffee tree, which is in flower for a very short period, there is very little for them to get honey from, how, I repeat, is it possible that the conditions would be so different near cliffs some eight miles distant that they would be found there? The absence of cliffs on an estate would make a difference; but it will be noted that this is not given as a reason for bees not being found on a coffee estate, but the paucity of flowers. If it is answered that the jungles surrounding the cliffs would provide the trees to supply the bees with honey, I may state that jungles are not infrequently found in the vicinity of coffee estates into which it would be just as easy for bees to make foraging incursions as for them to traverse a distance of eight miles from cliffs to visit a coffee estate in bloom. And although it may be true that the shade trees flower only once a year, yet as different species of trees are grown for shade, and they don't all surely blossom at the same time, it is possible that relays of blossom are provided sufficient with what can be got from the neighbouring jungles to supply the requirements of bees at any rate during particular seasons.

That there would appear to be sufficient inducement for bees to fix their quarters on a coffee estate, I may adduce an example to prove. In the Santikoppa District of North Coorg, there is an estate which derives its name from the fact that a large tree situated in it is covered with honeycombs twice a year. I never tried to count the combs on the tree, but I know its branches used to be black with them. The bees used to come some time before the coffee flowered and go away some time afterwards. I can't recall the exact dates, but I know they were always there during the coffee blossom time. They would return again after the monsoon, when one would fancy there was hardly anything for them. The natives said it was when the paddy flowered; but the trained quick sight of a bee can twig a blossom where we can detect nothing. The estate referred to was planted with the following shade trees:—*Nogas*, *Atti*, *Goni*, *Kuri Busri*, *Bili Busri*, *Pralwan*; and there were besides *Cinchona* and jungle trees. The difficulty is not that there is not sufficient inducement for bees to fix their diggings on a coffee estate, but providing them with suitable places to build in.

It is a fact that coffee blossom is fertilized to a large extent by various sorts of insects, especially moths. This may be noticed by any one going amongst the coffee at night when it is in bloom; so that we are not entirely dependent on bees for the fertilisation of the blossom. I agree with your correspondent that it is absurd to say that a bee will only fertilize 150 flowers a day. I couldn't trust myself to calculate the exact number of blossoms a bee could get over in a day, but I have watched a single bee get over a surprising lot in a very short time.

I cannot, however, agree with your correspondent when he says that it is immaterial whether the pollen drops on its own or another stigma; or that the coffee blossom is for the most

part self-fertilizing. Hear what expert authority has to say on the subject. Says Sir J. D. Hooker:—"It has also been proved that, as a rule, a pistil fertilized by the pollen of another flower or by that of the flower of another individual of its own kind produces more and larger seeds which grow into stronger plants than if it had been fertilized by the pollen of its own flower."

"These and many other observations tend to prove that the elaborate structures, colours, scents, sugary secretions, and other attractions of the corolla, stamens, and pistil, and their adjustments to one another and to the forms and habits of insects, are all intended to prevent flowers from being fertilized by their own pollen and to facilitate their being fertilized by pollen brought from other flowers, and also that the adjustment of the parts of the flower to the form and habits of the insect or bird, and of these to the flower, is so accurate, that it is in vain to speculate whether the plant is best adapted to feed the animal or the animal to fertilize the plant." This I think effectually disposes of your correspondent's contentions.

He says that the merest puff of wind would carry the pollen to an adjoining stigma. Is it not possible that there may be some provision by which the pollen grain is prevented from being detached in this way? Even if it were detached, its reaching a stigma would be the merest chance from the position of the latter. You see the pollen grain has to be deposited on the upper surface of the lobes of the stigma, and this would be precluded by many of the stigmas curving downwards. There would in this way be a large waste of pollen which a coffee tree could ill afford. We see this waste provided against in wind-fertilized plants by the tremendous lot of pollen they produce. The flowers of wind-fertilized plants are scentless and have no sugary secretions or bright attractive colours, and the pollen is like dust and produced in great profusion. It strikes me that if coffee blossom could be so easily fertilized by the wind the Natural Selection would have taken care that it had no useless appendages.

H. G. R.

BRAZIL PLANTING METHODS.

THE following very instructive and interesting interview with Mr. G. A. Talbot is taken from the *Ceylon Observer*. Mr. Talbot is a Ceylon planter who was, we understand, specially deputed by the Dumont Coffee Company to report on their property, and did his work to the thorough satisfaction of all concerned.

It will be noted that the yield is about 11 cwt. per acre, that the cost of production is about 13 shillings per acre with Italian labour at 3 shillings a day. A rough computation of profits, taking 50 shillings as the price per cwt, shows a net return of say £20 per acre. That the temperature is about 70° and the rainfall 70 inches. The cultivation and picking are bad, and Ceylon methods are to be tried. The coffee-bushes are unpruned, and grow to about 12 feet high. The Government is unstable, but landed property is unaffected by political disturbances.

Our readers will note that Mr. Talbot will remain in Ceylon for some months, and enquiries as to berths should be addressed him there. Probably if sent to the care of the Editor, *Ceylon Observer*, that gentleman would be good enough to forward them. The head offices of the Company are in London.

"The property of the Company consists of about 14,000 acres bearing. It is situated about 1,500 feet above the sea-level; but

must remember that that it is not the same as 1,500 feet in Ceylon, where here coffee land is only about 7 degrees north of the equator, and in Brazil, the Company's property is about 25 degrees to the south of the line. Consequently, the Brazilian climate is much more temperate, resembling that of Arabia. Yes, the estate is planted with *Arabica*. As regards the location of the estate, it is situated in São Paulo State, about 300 miles distant from the town of that name. A railway runs from São Paulo to within 13 miles of the Company's property; and between the terminus and the estate we have a railway of our own. This railway is of 2 feet gauge."

Can you give me any figures as to "the cost of haulage, working expenses, etc.?"

I cannot give you any precise figures, but it certainly answers very well and works economically. We also run passengers over the railway; the carriages are entered from the ends, and are fairly comfortable. The goods waggons are of the ordinary bogie type. I cannot work out the cost of transport per cwt., but I know that in the aggregate the cost is low as compared with the cost of similar transport in Ceylon. Santos is our market from which the coffee is shipped.

"What about the yield per acre?"

I think I am safe in saying that the average yield per acre is about 10 cwt. People in the district think that the labour supply is sufficient; but, according to Ceylon ideas, there are not enough of labourers. The labourers are principally Italians. They are not indentured. I believe you have to requisition the Brazilian Government for labourers and they assist in some way in bringing them over. I went to see some of the agents in Genoa on my way out, and they told me, if I went through this form, they could send me as many as I wanted. The bulk of the Italian labourers are peasants from the plains of Lombardy, with blue eyes and fair hair and many of them fine looking men and women. They do not pick so well as we did with Tamils in Ceylon.

"Can Europeans perform manual labour in the open without injury to health?"

"Oh yes! the property is just outside the tropics and the climate very healthy, the daily pay is something over three shillings per day."

Does not this high rate of pay largely increase the cost of production?"

No, because there is so little cultivation. The cost is about thirteen shillings per cwt. All the cultivation we have to do is hoeing, and weeding and the yield per acre being large, it makes the cost per cwt. much cheaper than it was in Ceylon. In Brazil we do none of the manuring, draining, handling and other odds and ends which were done by Ceylon planters.

Does the absence of pruning not cause the bushes to deteriorate?"

Pruning appears to be unnecessary, seeing the large yields we are getting. Draining can be dispensed with as the rainfall is not heavy. There was no rain gauge available, but I should say the rainfall was about 70 inches a year."

"What about the temperature?"

I fancy it would average about 70 degrees. Picking begins in January and goes on till about the end of August. There is a good deal of machinery on the estate, but the curing is not nearly so well done as it is here. However, we hope that by introducing Ceylon methods, we will be able to improve the quality very much, and to get a very much better price. In Ceylon, as most people know, we pick the coffee when it is ripe, pulp it, dry it, and then what they do is to peel it; whereas in Brazil they pulp only a very small proportion, and let it dry in the cherry and then hull it with a huller. The fault is that the husk being on the coffee so long takes off what is called the "colour" or quality and it gives an inferior flavour as a result of fermentation goes on. What we propose to do is first to get the coffee picked carefully done, and by introducing Ceylon methods and Ceylon machinery we hope to get a better sort of coffee. That cannot be done at once but it can be done by degrees. There will be a little difficulty in getting the men to adopt the new methods; and, probably, they will want higher wages for more careful plucking, and that way it will increase the cost of production, no doubt, but we think it will give us something like Ceylon coffee. As I have said, the people on the estate say we have all the labour we want and that we can get as many as we like, which is very satisfactory, as the intro-

duction of new methods will necessitate a larger labour force. In saying that much less cultivation was necessary in Brazil than in Ceylon, I forgot to mention that all the weeding is done with the hoe and not by hand picking, the work being done about five times a year. In Ceylon owing to the heavy rainfall, hoeing is impossible as the soil would be washed away. In Brazil no such difficulty presents itself and consequently the expense of weeding is very much less. The coffee bushes grow about 12 feet high, but they are not so lanky as those in Ceylon because of the more temperate climate of Brazil. The Italians have a comparatively easy time. When they are not required by the estate, they cultivate maize in the coffee fields for themselves. The maize they use for fattening pigs, and they contrive to make a good deal of money out of it. In some of the young coffee fields you can scarcely see the coffee for maize.

"Does it not smother the coffee and exhaust the soil?"

It is said not to injure it and the soil seems so rich as to be able to grow both. I however do not like it, and I hope we shall be able to stop, to some extent at least, maize being planted among the coffee.

"What about the cost of weeding?"

Weeding is done by contract, 80 milreis being paid for 1,000 trees, that is about £1 per acre."

"Have you ordered any machinery from Ceylon?"

At present there is no Ceylon machinery on the estate. The machinery is by Ledgerwood, a Glasgow firm, which competes with Messrs. Walker. Now that we are going to adopt Ceylon methods, we shall certainly use Walker's peelers and pulpers.

"What about power?"

"Steam is used, but at two or three points on the estate water power is available."

"Have you any black labour?"

"Not much. There are a few negroes about. A most extraordinary thing about that part of Brazil is that the slaves who were only emancipated some eight years ago are hardly to be seen anywhere. Where they have gone to I don't know. Most of them I fancy have drifted into the large towns and others have squatted on waste land."

"What about the future of the Company?"

"I am very hopeful of the future of the Company, and the best test of its continued prosperity is found in the fact that in the London market the shares are readily saleable."

"Does not the prosperity of the Company depend on the stability of the Government? What are your views on this subject?"

"I do not think the present Republic is a very stable Government; as a matter of fact, they were talking about a revolution when I was there. But a revolution in Brazil makes very little difference to property, especially if it is landed property, though it might be somewhat serious if the currency was disturbed. I consulted a man of some position—the manager of a large English Bank—on the subject, telling him that one of the things urged against subscribing to the Company was the unsettled state of the country, and he said—'Nonsense, landed property, house property, real property is perfectly sound and one need not fear anything.' I also asked a leading lawyer—a man of standing in his profession—and he said since the Brazilians had to pay the large indemnities to Italians they had been very careful to guard the rights of foreigners. Personally the Brazilians are a pleasant people to have dealings with."

Mr. T. L. Villiers of Yoxford, Dimbula, will take charge of the estates and he sails for England in the "Malta" on 11th Feb. No doubt Ceylon methods under his direction will have beneficial results. Mr. Villiers is to be congratulated on this important appointment.

Mr. Talbot went upcountry yesterday morning on a tour of inspection of the property of the Ceylon Tea Plantations Company. He remains in Ceylon about a month, and he will then leave for the Straits, visiting Selangor, and thence on to East Java, where he has properties, and afterwards to Batavia. He hopes to finish the trip in six weeks, and to leave Ceylon again for England about the end of March.

TEA.

TEA IN 1896.

THE tea season 1896-7 has now closed, and Indians have reached the record figure of 146,000,000 odd pounds, a

considerable increase on last and any preceding years. This increase on production is doubtless accounted for to some extent by increased acreage under tea in Travancore and South India generally, but mainly by expansion of the industry in the Dooars and Assam.

It is gratifying, however, to notice that the larger outturn has not been accompanied by the serious fall in prices.

The season, however, has not been an altogether satisfactory one. The Mincing Lane sales opened with a high range of prices; some people thought that another year like 1894 was to cheer planters' hearts, but later on in the season prices fell considerably, owing, we imagine, to forecasts of a very heavy outturn and inferior liquoring teas, and later the rise in the rupee made the prospect of a larger dividend earning season a very remote one. Towards the end of the season the market again rose for flavory and high grade teas, but buyers, as a rule, have had the advantage of all teas of 9d. and under. Provided, however, that the rupee remains in the neighbourhood of 1s. 2d., and is not artificially propped up by the Secretary of State in Council and the Government of India, the price of tea remains at a value which should give good dividends to well-equipped gardens, with large yields, and economically worked, but owners of small gardens, such as those that flourish on the Nilgiris, must insist on a higher class grade of tea being made, better plucked, manipulated and packed if they also expect to reap large returns from their enterprise. There is always a market, and a good one, for flavory high class produce, and an effort should be made to attack it with Nilgiri produce on equal terms with Darjeeling growths.

The chief feature of the past season has been the successful manner which the American and Canadian markets have been attacked by Mr. Blechynden, the accredited Agent of the Indian Tea Association, but money is now wanting for carrying on the campaign, and the United Planters' Association, now so many of the members are interested in tea, should take up the matter of South Indian planters subscribing to the fund. A levy of 4 as. per acre would doubtless willingly be paid, and would add considerably to the fund. The importance of such a step cannot escape the attention of owners, managers or assistants, for every million pounds of tea taken off the English market must make a considerable difference in the value of the remainder, and such a small impost would be quickly repaid by improved prices. Owners would directly benefit, and the billets of managers and assistants be more secure.

Australia again has become a considerable factor in the consumption of Indian grown tea; for a long time the bushmen would have none of it, but China imposed too much on her clients, sending such adulterated rubbish, that the good and economical qualities of Indian teas are now freely recognised by the Australians, and the consumption is going up by leaps and bounds, and will in the near future take 5/6,000,000 lb. off the market, an amount which will undoubtedly steadily increase.

The European market has not been neglected, and France, Germany, Spain and Portugal are all giving evidence of their appreciation of the cup that cheers.

It behoves producers, even at present prices, to first

improve the quality and cultivate higher, and at the same time take advantage of all labour-saving machinery, and reduce the cost of production per pound to the very lowest point consistent with efficiency.

On these hills especially, acres of land are cultivated carrying only a percentage of the plants they should be able to extend largely. Would it not be economy to supply up all this unremunerative land, or to abandon it? An improved jât of plant is required to be more generally planted up here, and then with our magnificent climate, combined with a high system of cultivation, our splendid communications, and cheap transit, and with improved methods of manufacture, London brokers would look for Nilgiri marks in the same way as they now do for Darjeeling, and the prosperity of Nilgiri tea planters would be assured.

With regard to manufacture there should be more interchange of ideas amongst planters. Samples should be exchanged with brokers' remarks, prices, &c., and emulation would soon arise, with a marked improvement in the quality turned out. Till something in this direction is done by the planters themselves, we can expect but little improvement. At the same time, with all the advantages we possess over other localities, it is disheartening to see Nilgiri teas, with notable exceptions, taking a back seat at all sales, and the lowest amongst all other hill districts.

The last reports to hand report a good market for flavory teas with a good infusion, and we trust during 1897 to see some Nilgiri marks take their proper place amongst the honor list in Brokers' reports.

Indian exports.

From the last Monthly Return of tea sailings of the Indian Tea Association, the following figures are of interest:—

TOTAL SAILINGS FROM	1896	1895	1894
	lbs.	lbs.	lbs.
1st April to 31st December.	128,128,411	119,705,655	111,575,444

The Australian market seems depressed, but the increase of shipments to America is most marked, being more than double those of the preceding year, and nearly five times those of 1894, which were only $\frac{1}{2}$ million pounds.

Japan enterprise.

We have already published the fact that Japan is girding up her loins for the struggle in maintaining her tea trade in America and elsewhere. It does not appear that they have as yet succeeded in obtaining the necessary funds, but it is noteworthy that they propose to maintain two representatives in India and China to keep the Japanese planters in thorough touch with the methods of their successful rivals. It seems rather absurd that they should go to China to learn lessons in tea making, but we do not fancy the idea at all of their investigations in India. Those little Japs are a great deal too quick and clever in imitation, and it would be just as well to crush them by extinguishing the American trade, before they have the chance they want.

Prunings and disease.

In the article in our last issue "Prunings and Disease Germs," we made a rather sweeping statement as to the necessity of collecting and destroying all tea-prunings before the leaf had time to drop off. In cases where tea is *absolutely*

in such diseases as black bug, red spider and so forth, the work of burning the prunings is scarcely needed. The necessity is certainly not apparent. But wherever any such disease is noted, however slight the attack may be, the precautions we advocate are wise ones, and can only be neglected at the peril of the planter. And the larger the garden which the disease appears, the greater the danger, and the greater difficulty in combating it when once firmly established.

Ceylon tea yield.

The official estimate for this year is 117½ million pounds, an increase of roughly 9 millions over last year's shipments, or 8½ per cent. Compared with the last few years the figures run as follows:—

		lbs.	Increase per cent.
Actual shipments 1891	...	65,274,421	...
" 1892	...	71,153,657	48
" 1893	...	84,406,064	4
" 1894	...	84,591,714	19
" 1895	...	97,939,871	nil
" 1896	...	108,141,412	13
Estimated 1897	...	117,250,000	10
			8.5

If, as the *Observer* fears, and the *Times* ridicules, the increase will be still greater the next few years, owing both to the planting up of poor reserve land and of manuring old tea, it will not take long before the Island outstrips the continent.

Artificial manures.

As we stated in our last issue, the consensus of opinion in Ceylon is that on old coffee lands, the yield of tea is quite doubled by the use of manures. It is of practical interest to note the proportion and amounts used. A favourite mixture being part of crushed bones to 3 of castor cake or fish, 5 ozs. of the mixture being applied to each tree. This means only about 6 cwt. per acre, and if, as in many cases, the yield rises from 300 to 600 lbs., it should be decidedly worth trying in South India, especially on old and steep, monsoon washed estates. It is held, too, that the effect of this artificial manuring lasts for two years, so that in reckoning out the cost of an experiment in this direction, this point should be noted. The only thing apparently that deters Ceylon planters from manuring as a matter of regular routine is the scarcity of labour. A very important point has been touched on, i.e., what is held to be the inevitable loss of yield due to repeated manuring on old estates. Personally, I think this evil could be easily avoided with a little thought. It is the old story of human wits against natural laws. Don't accept the usual results of the laws as final; obey the laws as your servants, don't let them be your masters.

The Mariawatte Estate.

Everyone almost has heard of this estate, with its prodigious yields. It is interesting to note that its best field (18 years) of 100 acres is still giving over its thousand pounds per acre. The manure, we understand, is brown sweepings; in plain words night soil. The following details are from the *Ceylon Observer*:—
"Mariawatte Estate Tea Crop return for 1896.—Total acreage 467 acres; total yield 410,436 lb., being 878 lb. per acre all round; of which the original 100 acre field has contributed 1,090 lb. per acre."

This 100-acre field is now 18 years old, and that it should still give nearly 13 maunds of made tea per acre is, we fancy, unique in the history of tea cultivation. From our "Handbook and Directory" we quote the past record of Mariawatte:—

"Mariawatte Estate original 104 acres planted 1879.—Yields: 1884 1,050 lb. per acre; 1885, over 1,133 lb. per acre; 1886, 1,018 lb. per acre; 1887, 1,115 lb. per acre. The acreage of young and old tea plucked over in 1887 was 307 acres and the total yield was 184,695 lb. or 600 lb. per acre, and when it is considered 147 acres of this was only 3-year old tea, the yield may certainly be called magnificent.—Mariawatte yield for 1889 over 424 acres was 625 lb. per acre; the original hundred acres gave in 1889 1,094 lb. per acre; in 1888 the yield from this field was 1,023 lb. per acre; in 1890 the crop was 321,167 lb. or 757 lb. per acre in bearing, the old 104 acres giving 140,144 lb. or 1,347 lb. acre—no manure for two years. In 1891, the yield was over 120,362 lb. or 1,114 lb. per acre; for 1892, it was 417,800 lb. for the estate—the old 100-acre field giving 1,114 lb. This was planted in 1879 and from 1884 has given over 1,000 lb. an acre, the highest return being 1,347 lb. in 1890. The average for nine years is 1,130 lb. For 1893, 1894 and 1895 we may say that the yield of the old Tea is still keeping up to over 1,100 lb. per acre and has every appearance of continuing its large yield, owing to the systematic application of bulky manure, say over 20 tons per acre, one-third of estate being so manured every year."

The Home Market.

The market for Indian tea opened on Monday, the 15th January, says the *Produce Markets Review*, when upwards of 30,000 packages were offered at public sales. Prices generally showed a firm tendency, especially as regards fine and finest grades. From the figures given below it will be noticed that the deliveries for the past month were on a very large scale, while the statistical position is particularly strong. This fact appears to have stimulated business, competition for desirable kinds showing an improvement, and all grades possessing quality marked a distinct advance on the easy rates established before Christmas. The finest kinds of both leaf and broken have shown a somewhat stronger tone, due to the generally small proportion offered. The deliveries in December were considerably in excess of those during the same time last year, showing an increase of 1,646,611 lb., the total being 11,584,879 lb. compared with 9,938,268 lb. in 1895; the imports, 18,526,383 lb., as against 17,305,803 lb., and the stock only being 1,506,125 lb. larger, the figures being 54,144,603 lb., against 52,638,478 lb. Taking the twelve months into consideration, the imports amounted to 125,412,214 lb., against 119,306,191 lb. in 1895, while the deliveries showed the large total of 124,651,855 lb. against 115,097,994 lb. The opening sales of Ceylon tea have been smaller than was anticipated, but prices do not at present show any signs of an upward movement. On the contrary, broken Pekoes generally may be quoted easier, and these kinds undoubtedly show better value than has been the case for some time past. Whole leaf teas show little, if any, change, and the commoner grades are entering freely into consumption at the very low range of prices recently established. It seems hardly possible, however, that the retail trade can be fully alive to the excellence of the value obtainable at from 5d. to 6½d., or a much larger business than is at present passing would be inevitable. The following are the figures of the past month compared with December last year:—The imports amounted to 7,387,000 lb., against 4,799,000 lb., and the deliveries were 6,990,000 lb. and 5,506,000 lb., while the stock stands at 18,354,000 lb., as compared with 13,812,000 lb.

DISTRICT ASSOCIATIONS.

NILGIRIS.

(From the "Madras Mail.")

OOTACAMUND, 22nd January.—The adjourned meeting of this Association took place on the 21st instant at the Masonic Hall, Ootacamund, when the following gentlemen attended, namely: Mr. Rhodes James, Mr. J. H. Tremenheere, Mr. J. W. Minchin, the Hon'ble Mr. H. P. Hodgson, Mr. W. L. Edmiston, Mr. L. W. Gray, Mr. G. Salmon, Mr. E. C. Marsh, Mr. E. G. Windle, Mr. J. H. Pascoe, Mr. J. W. Cherry, Captain N. G. Beadnell, Mr. G. Oakes, Mr. A. S. Cowdell, Mr. F. F. Turpin and one or two others.

On Mr. Minchin being called to the Chair, the Honorary Secretary opened the proceedings by briefly recapitulating the leading topics discussed and disposed of at the last General Meeting. Reference was made to the contribution by this Association to the funds of the U. P. A. S. I. and to the Sambur vs. Shade controversy. Mr. W. Mullaly's Resolution then recorded was re-read and the Hon'ble Mr. Hodgson's amendment, that was carried by a majority, was referred to. The proceedings of that Meeting were then confirmed by a show of hands. The second item on the Agenda was the reading of the correspondence between the U. P. A. S. I., Messrs. Binny and Co., and the Chamber of Commerce, regarding the exemption of chemical manures and of tea seed from import duty. There was a disinclination to co-operate with the Ceylon planters in this matter, owing to the irritation still felt at the attitude of indifference shown by the Ceylon men last year on the Tea Duty question. The Hon'ble Mr. Hodgson told the meeting that in communication with Mr. Acworth, he would move Government on both matters, as soon as it was in possession of the statistics on imported chemical manures, applied for from the U. P. A. S. I. and from other sources.

The Association next resolved to support the action of the U. P. A. S. I. as recorded in its circular letter announcing that Government had issued orders that enquiries be made as to the effect on Scale Bugs in Hawaii of the introduction of lady-birds, and the cost of procuring a consignment of lady birds; and as to whether Professor Koebele might be prevailed upon to visit this Presidency to investigate the pests.

The correspondence that passed directly between Mr. Sanderson, the Chancellor of the Exchequer, the Secretary of Customs, London, and the U. P. A. S. I. on the subject of an excise duty on coffee, and the treatment of coffee in the London Docks was then referred to, and the Association resolved that it could not do better than await the issue of the action of these authorities.

On the proposal of the Shevaroy Planters' Association to form an organisation for the protection of coffee from adulteration and the reference made on the subject by the U. P. A. S. I. for an expression of the views of this Association, it was resolved to leave the question for consideration to another and a later meeting, but on the Honorary Secretary urging that a postponement was undesirable, it was decided to inform the U. P. A. S. I. that independent action did not commend itself, and that what was to be done should be done by and through the U. P. A. S. I.

Another circular of the U. P. A. S. I. regarding the representation of South Indian planting interests on the London Chamber of Commerce was read and discussed. The opinion expressed was that as Mr. Mangles was willing to serve as the South Indian planters' representative, and he was in every way a suitable and strong man, his offer should be accepted. Regarding the Reserve fund of the U. P. A. S. I., it was resolved to approve of the proposal of the U. P. A. S. I. that it should be lodged preferentially in the Bank of Madras.

There was some discussion on reducing trade discounts in London on tea and coffee and a circular on the subject received from the U. P. A. S. I. read to the meeting. It was the opinion of most of the members present that the question was a fitting one to leave to the South Indian Planters' representative on the Chamber of Commerce to move in, and it was resolved to inform the U. P. A. S. I. accordingly and to support its action.

The maintenance of internal boundary stones on estates was a question that the Association had before it on a former occasion;

but it was not yet ripe for final decision. Mr. Tremenheere stated that the matter had been referred by him to the Board of Revenue but that they had not passed orders upon it. When such orders were received, he would lose no time in communicating the result to the Association.

He was also the principal speaker on the following item on the agenda regarding damage done by sambur to shade trees. The settled course of action adopted was for himself and the District Forest Officer to visit localities where damage was alleged to have been committed, and on finding the complaint valid to adduce Government for a temporary relaxation of the game protection rules. No orders had yet been received, he said, on any reference thus made, and action of the Association at present in that direction would accordingly be premature.

The claim of Mr. Hockin for remuneration for services rendered by him as a member of the Enquiry Commission was placed twelfth on the Agenda, and the correspondence that had passed between that gentleman and certain Associations and the U. P. A. S. I. was laid on the table and some of it read, with the result that the Association accepted the agreement entered into by the U. P. A. S. I. with Mr. Hockin, to reimburse him the salary he paid Mr. McInnes as his Superintendent during the months he was engaged on the Enquiry Commission. Some allusion was made in this connection to the practice of calling upon members to vote on subjects treated in voluminous correspondence without giving them the opportunity of reading the correspondence or of knowing what they were voting for or against; but no notice was taken of the protest.

The issue and service of warrants under Act XIII. of 1859 and the article of the *Madras Mail* of the 1st December was not considered. A statement was made by Mr. Tremenheere and thereupon the Association resolved that when a case of the kind came before the High Court on reference or revision, they should be informed and afforded the opportunity of engaging Counsel to represent planting interests.

The meeting expressed approval of the action taken by the U. P. A. S. I. and recorded, intimating that the Madras Government was addressing the Government of India with a view to the appointment of a full time medical officer to investigate the theory of transmission of malaria by means of the mosquito.

In reference to the call of the U. P. A. S. I. for a list of the members who desired to become subscribing members to the U. P. A. S. I., the Hon'ble Mr. Hodgson stated that the principle of permitting individuals to become members of the United Association irrespective of the position of such members in affiliated District institutions was already accepted by the U. P. A. S. I. and that only details remained to be worked out—those, therefore, who wished to join were invited to send in their names.

Mr. Windle asked for a reward for the toll-gate keeper who helped him to detect a case of coffee theft. A sum of Rs. 50 was sanctioned.

In conclusion Mr. Edmiston reported that it was impossible for him to continue to be Honorary Secretary any longer, and that he was reluctantly compelled to resign as the office interfered with his work. He was, however, glad to say that an able and willing successor had come forward in Mr. Windle, who was specially qualified for the post.

The meeting resolved to pass a vote of thanks to Mr. Edmiston for his past services and to accept Mr. Windle as the Association's Honorary Secretary for the future.

Mr. Edmiston gave a brief statement of the accounts for the past 4 years, and requested that the Association might arrange for the auditing of his accounts, to carry out which duty Messrs. Turpin and Cherry were nominated. The Hon'ble Mr. Hodgson proposed, and it was duly sanctioned, that Rs. 20 be allowed monthly to enable Mr. Windle to obtain the services of a writer to help him in keeping the accounts and copying papers.

TRAVANCORE.

THE Annual General Meeting of this Association was held at the Church Bungalow on Saturday, the 26th January, at 9-45 A.M., when there were present: Messrs. H. W. Baker, H. J. Blandford, L. Crawhall, J. Finch, R. H. Goldie, R. S. Imray, C. Lance, B. Lane, Rev. Father P. Segretain, R. D. Tollemache, A. E. Veale, the

B. Wilbraham and G. L. Acworth (Hon. Sec.); also as visitor, J. Knight.
Mr. Goldie, who was moved into the chair, in opening the meeting : "You are all aware, gentlemen, of the sad cause of my presence in the chair here to-day, and I will not say more than that Mr. Ashton has the fullest sympathy of every member of this Association. On the Agenda Paper I would draw attention to the subject of Government buildings, in particular that of the hospital, which at the present moment may be said not to exist, for the only accommodation there is an open and unroofed shed. I will not detain you further, but will move that the minutes of the last meeting be taken as read."

His having been carried, the Chairman called on the Hon. Sec. to read his Annual Report, which was as follows :—

CHAIRMAN AND GENTLEMEN,

In reviewing the year that has just passed, I think we may first of all congratulate the Association on its continued vigorous life. There is now not a single planter in the district whose name is not on our list, and the full attendance at our quarterly meetings together with the ample discussion of all topics more than testifies to the general interest in our welfare. In spite of a heavy drought followed by one of the worst monsoons on record, the year has been not unprosperous one, and, though there has been a general fall in prices for our produce, our crops have been fully up to the average, and the fall in prices has been general throughout India, by no means confined to this district alone. This universal decline is due to a deterioration in the quality of our produce, but to the fact, as stated by Messrs. Gow, Wilson and Stanton in a recent circular, that the production of British grown tea has now more than over-whelmed the home consumption. The position is a very grave one, and more than ever incumbent on us and on all growers of tea to combine together for the forcing open of new markets, and this being the case, it is most gratifying to be able to record that this district has done its full duty in supporting the

Indian American Tea Fund.—Every estate subscribed its full quota, and many individuals, not proprietors, contributed. From various American newspapers I have from time to time laid upon the table, you have been able to judge for yourselves what excellent work has been and is being done in that quarter of the globe by our able representative, Mr. Blechynden. The hearty thanks I testify to the good fruit borne of his efforts. The hearty thanks every tea producer are due to that gentleman for the skill, energy and energy he has displayed in carrying on the campaign. He will again be called upon in the current year for contributions to his Fund, and, being as it is a Life Insurance Fund for us, I am satisfied you will all respond as liberally as you have done heretofore. The *Labour Enquiry Commission* has been for us the great event of the year, and, the labour question being so serious a one for us indeed for all planters in Native States, it is earnestly to be hoped that the Committee's Report will soon be passed on from the Government of India to that of Fort St. George. You may rest assured that Mr. Rees in the one Council and our Planting Member the other will not cease to press for its production.

Roads and Communications have as usual been a subject of complaint throughout the year, but I would point out that our new Chief Engineer took over, as the *Western Star* expressed it, an "unpleasant Stable" and has had practically to re-organise the whole department. It is impossible for him to put everything in order at once, and I am convinced that time being given him, we shall in course see not only an immense improvement in the roads in our hills, but also in the various lines of communication throughout the state. You will be glad to know that I heard from the Dewan a short time since that the maintenance allowance for the main roads throughout our district has been increased. We have also to congratulate ourselves on the fact that, now that a subsidy has been granted for the Day Karnum and Kuduv Karnum roads, all roads in the district are partially maintained by Government.

Medical Fund.—Owing to the utterly inadequate arrangements of Government we have been compelled this year to form a fund amongst ourselves for the support of a medical man, and we have been fortunate enough to secure the services of Dr. Joseph. Hitherto, in spite of our representations, we have received no assistance from Government, which has looked coldly on our schemes, and

asserts that its rules will not admit of its aiding us except under certain conditions, which conditions are in themselves so utterly unsuited to a district of this kind as practically to amount to a refusal. We further approached the Government with a view to the establishment of a first-class hospital in our hills, expressing our readiness to bear a fair share of the cost, but were again met with a refusal. However I trust the decision of Government on this point is not final.

Health of the District.—In the past year the months March to May inclusive were exceedingly unhealthy, fever of a severe type prevailing amongst our coolies. I should not have noticed this but for the absurd and exaggerated reports that have appeared in the Press. It is utterly false, as stated by a correspondent to the *Madras Times*, that there were eight hundred deaths distributed amongst the various estates. To my certain knowledge there were not a third of that number, though I admit the death-rate throughout the district was higher than is usual.

Personally I attribute the extreme unhealthiness of the spring of the past year to the abnormal drought following on a very light monsoon, and to the consequent inadequate and impure water supply, and this I believe is the opinion of every reasonable person. To assign the cause to the Periyar Lake, as was done by the correspondent of the *Madras Times*, is too ridiculous, as a moment's reflection will show.

In the first place there has been for several years past a large body of water behind the dam, and we should long ago have felt its effects had they been at all adverse to the healthiness of the district.

Secondly, we know that the miasma is a low lying gas and the estates are all at a considerable height above the lake, whilst the nearest thereto is at least two miles distant as the crow flies.

Thirdly, at the very time when the fever was at its worst, the sea breeze was blowing strongly from West to East, that is from the estates towards the lakes, and would have been quite sufficient to prevent the advance of fever from that quarter.

Finally, and I think this clinches the argument, the two estates that suffered least were the two nearest the lake, the Mount and Arnakal. During the whole of the past season there was but little fever on either of these properties, and on the latter there was only one death from this cause.

Sales of Waste Lands have been wisely continued throughout the year, but much dissatisfaction had been expressed in more than one quarter at the present method of conducting them. It certainly seems hard that gentlemen should be at the expense of travelling nearly two hundred miles merely to find at their journey's end that the upset price as published by Government is not at all the price Government is prepared to accept, that without any warning a reserve of double the amount has been placed on the block applied for. Government of course has the right to reserve to itself the price at which it means to dispose of land, but it would certainly be well to publish this reserve some length of time prior to the auction, in order to deter the applicant from making an expensive and fruitless journey, should he consider the price excessive.

It may also be questioned whether the policy of the Government in this respect is a wise one, and whether it is not calculated to keep money out of the country. The planter's operations in Travancore have not hitherto proved so remunerative as to induce him to sink a large capital in the initial purchase of land. We look moreover chiefly to the small capitalist to open up the country, and such a man positively cannot expend a large sum in the mere acquisition of land, or if he does, he finds he is like the person who had not counted the cost of building a house, and he has to abandon his operations when only half completed. Such being the case, it would seem that by its present policy Government will in the long run be the loser, for Government should look for its profit not to the mere proceeds of the sale of land, but to the revenue to be derived therefrom in the future :—to the land cess, timber royalties, tobacco duties and the hundred and one indirect ways by which money flows into its coffers. From sheer exhaustion of material land sales must one day cease, but should the land so sold be well opened out and developed, the revenue therefrom will flow on in a continual stream.

Game Preservation Laws, passed by the local Legislative Council, were sent up to the proper quarter for approval. They were, however, owing to one or two clauses, returned for amendment,

but have since been again sent up, whether amended or not I do not know. I trust however the time is drawing near, when the scattered remnants of our game will be adequately protected.

United Planters' Association of South India.—To this it is unnecessary to allude, as its last proceedings have already been laid before you, and moreover the Report is now printed and in circulation.

Administration of the State of Travancore.—Mr. Chairman, you must have noticed that in the leading Madras newspaper the administration of Travancore has lately been severely attacked, and that quite recently a very clever article has appeared in its defence in the *Pioneer*. As my name appears in the latter paper, I trust you and the meeting will pardon my detaining you, whilst I say a few words on the subject. Gentlemen, silence does not always mean approval, and if in my various Annual Reports I have not touched on this topic before, it by no means follows that you or I are satisfied with the Government of the State. My silence has been chiefly due to my having considered the matter rather outside the province of an Association such as ours. But having been practically directly appealed to, I feel it incumbent on me to make a few remarks. Regarding the now famous examination paper I shall say nothing. I have not seen or heard what the questions under discussion were. That they were improper I have not a doubt, but it is absurd to attack a Government for the action of an unprincipled examiner, who had, I presume, full control of his Department. It is an incident that might have occurred in almost any State, and which the Government thereof would not only disapprove but deplore.

Against Mr. Shungra Soobyer, C.I.E., also I have not a word to say, and I consider the personal attacks levelled against him have been most unjustifiable. He is no worse and no better than his various predecessors in office, and the faults of his administration have not only been common to all Dewans within my recollection, with the exception perhaps of Mr. V. Ramiengar, but will continue to be so just so long as the Chief Minister is selected locally. Such gentlemen are bound down by the traditions of the State, and from these shackles they either cannot or dare not free themselves. But that the Administration of Travancore is not what it should be, I have no hesitation in saying. So long as a country is undeveloped and yet buries a large annual surplus in a napkin, I trust the writer to the *Pioneer* will pardon me, so long is a State badly governed. The case against Travancore briefly is that each successive Minister endeavours to rival the surplus revenue of his predecessor, whilst obvious methods of advancing the interest of the population are neglected. We have a subordinate Magistracy whom common report affirms to be notoriously corrupt, the subordinates in the police, forests and survey departments are so ill paid as to receive scarcely a living wage, which is naturally supplemented by illicit methods: something is done, little however as compared with what ought to be done, to open up new lines of communication throughout the country, whilst those already in existence are as a rule in a condition little less than scandalous. We have as yet no railway, and that now to be brought into the country is, we venture to say, not the correct line. Quilon cannot be called a Port. Alleppey is, and has always been, the Chief Port in the country. Were it otherwise, the Mercantile Firms would gravitate to Quilon, but this is not the case, as you all know.

That H. H. Government recognises the truth of this, I take to be proved by the fact, that the residence of the Commercial Agent is at Alleppey. That the Brahmin element in the State is far too powerful cannot, I think, be denied, whilst the shutting out of the lower castes from Government service is alone sufficient to stamp the Durbar as behind the times. The writer of the article in the *Pioneer* says, "The introduction of the railway will effect greater fusion in a decade than could the Government in a century." Under ordinary circumstances this would be true, but how is this happy fusion to be effected by a railway running for the greater part of its length through one of the most, if not the most, sparsely populated corner of the country. It will, as a matter of fact, touch the minutest fraction of the population, and as a civilizing influence I fail to see its value. To really develop the country the railway should run in the first instance from Palamcottah through Nagercoil to Trevandram, and should eventually be linked up *via* Quilon and Waroor with Cochin. Such a railway would run through the

whole length of the State, and would effect an enormous moral and material improvement in the people.

Mr. Chairman, I have only had sufficient time to touch the fringe of this subject, but I have said enough to disabuse the public of the idea that this Association is an unqualified admirer of the Travancore Government. It is true that in the State Reports the administration is generally praised by the Resident for the time being, but these reports are to my mind very much what our roads are a little prior to the advent of a Resident or a Governor. They are furnished up with a layer of loose soil to look their best and to carry the official chariot wheels to run smoothly.

Gentlemen, I have already laid the accounts on the table, but I have a sad task to accomplish before I conclude this Report. It is my most painful duty to refer to the great and irreparable loss the district has sustained in the death of Mrs. Dighton. I will not say more than that our late Chairman, the cause of whose absence we deplore, has our most cordial and hearty sympathy. The loss will be keenly felt by all, but in the lives of some of us it has left a gap that can never be filled.

GRANVILLE L. ACWORTH,
Honorary Secretary.

Central Travancore Planters' Association.

Mr. Imray, in moving the adoption of the report, which was seconded by the Hon. V. B. Wilbraham, said that it was so full and ample as to make it unnecessary for him to add a word to it, and that they were all heartily obliged to the Hon. Sec. *Carriemem. con.*

The officers having resigned, the Association proceeded to the election of those for the current year, when the ballot showed the following result:—

F. M. Parker	... (Chairman.)
G. L. Acworth	... (Hon. Secy.)
B. Laurie	} Committee.
R. H. Goldie	
R. S. Imray	

Mr. A. E. Veale kindly consented to undertake the duties in connection with the Medical Fund. The Hon. Sec. having pointed out the increasing expenses of the Association, it was

Resolved that the subscription for the current year be at the rate of 4 annas per acre exclusive of the Medical Fund. Read correspondence relative to the carriage of tea across the back water, and

Resolved that the charge in future shall not exceed one anna per chest.

Government Buildings.—There was considerable discussion on this subject, the Association going into Committee thereon. The present site was freely condemned not only as being unsuitable and inconvenient, but also as being eminently unhealthy. Special stress was laid on the absurdity of establishing a so-called hospital on a spot where fever of a bad type was prevalent through the whole of the hot weather. It was finally

Resolved that Government be approached with the object of inducing it to move the present Government buildings into a healthier and more central situation.

U. P. A. S. I.—The Hon. Sec. having pointed out that all District Associations had paid the call of 50% on last year's subscription it was

Resolved that this Association pay the extra 50% call in question.

Land Sales.—The Association having gone into Committee on this subject on the motion of Mr. Veale, it was

Resolved that the Association is in agreement with the Hon. Sec. in regard to his remarks on this subject in his Annual Report.

The following papers were laid on the table:—

A large quantity of American newspapers kindly furnished by Mr. Blechynden.

Proceedings of Wynad Planters' Association.

Do.	Coorg	do.
Do.	Lower Pulneys	do.
Do.	Shevaroyes	do.

A vote of thanks to the Chairman and Hon. Sec. terminated the meeting.

GRANVILLE L. ACWORTH,
Honorary Secretary.
Central Travancore Planters' Association.

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

reading case
or "Planting
pinion."
must of course depend upon the time the worker can devote to
Take a strip of art linen about 12 or 13 inches wide and some
inches long, and turn up each end so that it forms a pocket
ut $9\frac{1}{2}$ inches deep; sew up the sides and then slip in a piece of
at cardboard exactly to fit. Stitch up the mouths of the pockets,
the case up like a book, and fasten inside a piece of white silk
tic, or one of narrow ribbon, under which to slip the current
ber of the journal. If the case is required to hold more than a
gle issue of *Planting Opinion*, a second piece of elastic or
on can easily be sewn in.

other method.
Another way is to cut two pieces of card-
board, each piece the same size, say about $9\frac{1}{2}$ "
 $11\frac{1}{2}$ ", and cover them separately, allowing plenty of material
turning over the edges and securing it on the inside with
cotine or glue to the cardboard. Two thinner pieces of card
uld next be cut $\frac{1}{2}$ an inch smaller each way than the other card,
ould be covered with some thin material, as linen, silk or satin,
n fixed inside the embroidered covers to make the inside neat,
ce the covers under a heavy weight to flatten them when finished.
e covers must be joined by a narrow ribbon sewn to each so as to
m the back of the case and an elastic fixed in for holding the
rnal. The following would be a pretty and ornamental cover. We
l suppose pale turquoise linen is chosen, the design traced thereon
sisting of a band of conventional wild roses, running diagonally
oss from top left-hand corner to right-hand lower one, the title
ng embroidered in the right-hand angle above this wild-rose
d, and the monogram of the owner in the vacant corner below.
The roses should be worked in pale shades of pink silk and the
tres with yellow, the stems with brown; the title and monogram
also worked with the brown silk, either satin stitch or outline
g used. The embroidery should of course be worked before
king up the cover.

**home-made cor-
ner shelf.**
Corner shelves are valuable additions to any
room which it is desired to keep neat and tidy.
Newspapers, periodicals, etc., are continually
umulating in almost every household, and it is quite a relief to
ve a corner in which to tuck them comfortably away, but where
y will not be lost sight of.

The three large shelves are made from boards from 18" to 20"
width, the front should be slightly rounded. The front sup-
ts or standards are 3' in length and $1\frac{1}{2}$ " square. The back
ndard is the same size, only 10" longer, as at the top is
ed a small shelf or bracket which will require two small standards
long and 1" square which should be fixed into the top large shelf.
e shelves may, if desired, be covered with cloth or velvet, and a
tty fancy fringe or frill tacked round the edges.

This of course would be a great improvement. Another good
a is to drape it with a pretty curtain of art silk round the edge of
e top large shelf. The curtain would reach almost to the ground,
d prevent the books and papers from getting dusty. A still more
xpensive way of making these shelves, although not quite so
amental, would be either to simply stain them with oak, walnut,
ebony varnish stain; or to paint them with enamel and to tack a
rrow border of either stamped leather or cloth round the edges.

Carrot Fritters.
Boil a large carrot till tender; beat it to a
pulp, pass it through a sieve, and mix with it
gill of cream, two tablespoonfuls of breadcrumbs, and two well-
aten eggs. Fry the mixture, divided into the shape of fritters, in
t dripping, and serve with good brown gravy.

**pineapple Cardi-
nal.**
Peel a pineapple and cut it into thin slices.
Put these into a deep dish, cover them with
powdered sugar, and let stand for five or six
ours. Put the rind into a small saucepan with as much water as
ll cover it; bring it to a boil, skim it, and pour it over the fruit.
ld six ounces of loaf sugar and a bottle of hock. Cover and leave
in a cool place for three or four hours. When required, stir well,
d mix with it a bottle of Seltzer water.

SPEAKING OF LONG AGO.

TO-DAY, as I pen these lines, one picture from the long-vanished
past rises in my memory as clearly as though it hung on a wall
before my very eyes. It is of a boy about fourteen years old, propped
up in a great arm-chair with pillows and bed-clothes, and gazing
through a window. He is just convalescing after a long and danger-
ous illness, and is still thin, pale, and weak. The strong arms of his
loving father have taken him from the bed and placed him snugly
by the window in order that the may see his playmates at their
games in the snow; for the time is mid-winter. They wave their
hands to him and he waves his hand feebly to them. The scene is
from my own boyhood, forty years ago. What magic has conjured it
up now? Only a sentence from a letter.

This: "I was so weak that for years I had to be carried upstairs to
bed." A lady speaks thus of her girlhood. What a pitiable thing.
It is not what nature meant; but alas! too often what really happens
in this perverted world. Children should never suffer pain, for pain
is punishment. For whose offences, then—surely not their own—do
the little ones sicken and die by uncounted millions?

"From childhood," so runs the letter, "I was always delicate.
When fourteen years old I got a chill on the lungs which left me in
a weak state. Indeed, I was always tired and weary, and never knew
what it was to feel strong."

Now, tell me, if you can, what sadder reading one is apt to come
upon than this? Fancy a young girl being *always* tired, weary and
weak!—too weak to climb the stairs to her own bed! so feeble and
lifeless as to require to be carried over the house through which she
should have skipped and danced like a fawn. What had so crushed
her? Disease? What disease and how caused?

"I was very pale," continues the letter; "My feet were cold and
clammy, and hot sweats now and again burst over me. My appetite
was poor; and, after eating, I suffered such pain at the chest and
sides that it often amounted to agony; and the palpitation of the
heart was so bad that many times I got no sleep at night on account
of it."

And this at an age when the heart should beat quickly only with
feelings of joy and hope; and girlish forms in their beds should be as
quiet as recumbent statues.

"After a time," says the writer, "I could take liquid nourishment
only, my stomach being too weak to retain anything solid. Thus, I
gradually wasted away until I was nothing but skin and bone. I had
not even strength to walk across the floor; and all who saw me said
it was impossible that I should ever get well.

"From time to time I saw doctor after doctor, and twice went to
the Sherborne Hospital, but received no benefit from the treatment
there. At last the doctors said that both my chest and bowels were
ulcerated and that there was no hope of my recovery. I was now so
bad that I could take nothing but weak brandy and water—and that
only occasionally.

"In this hopeless condition I lingered on until March, 1890, when
I heard of Mother Seigel's Curative Syrup. Although I had given
up all hope of deriving any benefit from any medicine, I nevertheless
sent for a bottle of the Syrup, and after having taken it for a few
days I found myself a little better. This led me to continue using
it, and shortly I was able to take solid food, and the sickness gradu-
ally left me. Holding to this medicine—the only one that had ever
helped me—I grew stronger and stronger until I was in good health.
Without Mother Seigel's Curative Syrup I should never have re-
covered; and you must try to imagine how grateful I feel. I never
can put my thankfulness in words. Yours truly (Signed) (Mrs.) Mary
Jane Hilliar, Rampton, near Sherborne, Dorset, March 9th, 1893."

We rest at this. Here is a life history. How can we comment on
it adequately? What a pity that this woman should have so suffered!
What a satisfaction to know that she suffers no more! And yet—
the lost time, the lost happiness! Ah, yes! Mother Seigel had
reason enough to induce her to labour as she did to relieve her
sister women. Thank Heaven for her success.

Mrs. Hilliar's real disease was of the stomach—indigestion and
dyspepsia; inherited, probably, and made chronic by circumstances.
The remedy she finally used cured this, and so freed her from all the
symptoms and results. How kindly are the arms that carry us in our
weakness. How glorious not to need them!

MARKET SUPPLEMENT.

SATURDAY, FEBRUARY 6, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (January 8, 1897) says:—Public Sales were resumed on Tuesday last after an interval of nearly three weeks, and large supplies were brought forward, which met a good demand at about previous rates.

The first shipment of new crop East India was offered in auction on Wednesday, and realised firm prices.

New Granada and Columbian which formed the greater part of the catalogues attracted good competition at firm prices for the better grades, but the commoner sorts were occasionally 1/- lower.

Futures have been firm on reduced estimates of the growing Brazil crops and quotations showed an advance of 4/- since our last, but at the close prices have dropped back 9d. to 1/- from the best.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending January 13th, 1897, says:—The Bank rate remains at 4¹/₂%. Bombay Exchange closes at 1s 3¹/₂d. Brazil Exchange 8¹/₂d. Rupee paper 3¹/₂ 0/63. Silver 29¹/₂d per oz.

At auctions the finer qualities continue to be very keenly competed for, and are about 1s to 2s per cwt. dearer, whilst other kinds are about unchanged. Brazil markets are quiet but steady.

Daily receipts have averaged 8,857 bags in Rio, and 9,000 bags in Santos.

Futures have been quiet, and shew a decline of 3d to 1s, viz.:—Good average Santos in Havre, March delivery closes at fcs. 65.00, in Hamburg pf. 53¹/₂, and No. 7 low ordinary Rio in New York \$9.65.

To-day's London official quotations are:—

	Jan.	March	May	Sept.	Dec.

CINCHONA.

the auctions held on Jan. 12th, writes the *Chemist and Druggist*, 733, ages Ceylon, 211 East Indian, 234 Javan, and 74 packages W. African bark offered. The demand was fairly good, but several parcels were limited to the rates obtainable at the sales and bought in. The average unit was same as that of the preceding auctions, viz: ½d. per lb. The following prices realised:—Ceylon: common old *succirubra* and *officinalis* root, 1½d. to 2½d. per lb.; Renewed Hybrid stem chips, 1½d. per lb. East Indian: Common stem chips, 1½d.; Hybrid ditto, ¾d.; *Officinalis* stem chips and shavings, 2½d. per lb. West African: *Succirubra*, in fair, partly-broken quill and 2½d. to 2½d. per lb. Java: good *Ledgeriana* stem and branch chips, 2½d. per lb. At auction only 550 bales were sold; but a portion of the remainder changed hands afterwards.

Stock of cinchona in London on January 1 was composed as follows:—Indian, Ceylon, African, and Java barks, 7,989 bales; S. A. Calisaya, 1,000 bales; S. A. Crown and grey barks, 302 bales; S. A. red bark, 41 bales; *Agave* bark, 733 bales; Cupress, soft Colombian, N. Granadian, and Pitayo barks, 9,102 bales. Total, 21,586 bales, against 26,219 and 30,619 bales respectively at the beginning of 1896 and 1895. At the Amsterdam auctions to be held on January 21, 6,573 bales and 564 cases of Java cinchona, weighing together 652,947 kilos, will be offered for sale. The manufacturing bark represents an equivalent of 35,608 kilos. sulphate of quinine, or an average of 10 per cent.

Services from Java reported enormous shipments of cinchona bark for the month of December. The following figures indicate the total exports of the four years:—

	1896.	1895.	1894.	1893.
Number Ams. lbs. ...	890,000	634,000	531,000	391,000
Value year ...	10,979,000	8,827,000	8,917,000	7,342,000

The Amsterdam stock in first hands on January 1 consisted of 2,694 packages of *Prunella* bark, and 14,346 packages private bark. These figures included quantities to be auctioned on January 21.

CARDAMOMS.

Of late, rather higher prices have been paid by buyers of cardamoms. In some instances sellers have been inclined to meet the market somewhat freely and have been successful in obtaining somewhat increased prices on those ruling six weeks to a month ago. For EXTRA BOLD, a few cases have been cleared at 4s. 6d. and 4s. 7d. per lb.—BOLD descriptions are commanding 4s. 1d. to 4s. 7d. per lb.; MEDIUM, 4s. to 4s. 7d. per lb.; SMALL, 3s. 2d. to 3s. 10d. per lb.; and SPLIT, 3s. 4d. to 3s. 5d. per lb.; while for SEEDS, the closing quotations are 4s. 3d. to 4s. 6d. per lb. These figures should be interesting to some of our friends in Ceylon, and since the arrivals here go to show that this cardamom business is evidently a paying one for shippers, it is evident that we can commend our friends abroad to give the trade some attention.

MISCELLANEOUS.

CARDAMOMS.—The arrivals since our last report, writes the *Chemist and Druggist* on the 7th inst., have been as follows:—29 cases, per Sarbedon, and 190 packages per Bullionist, total 219, all from Colombo. At to-day's auctions the large quantity of 250 cases was offered. Most owners were very willing to meet the market, and under these conditions 153 boxes found buyers at an irregular decline, ranging from 8d. to 11d. per lb. on the better grades, 6d. to 7d. medium qualities, and about 5d. on ordinary kinds. Pickings sold in one instance at a decline of 1s. 3d. per lb., seed at a decline of 9d. to 10d., and wild cardamoms at from 1s. to 1s. 2d. per lb. below the last auction rates. Some days previous to the sales some business had been done in medium lean Malabar kind at 3s. per lb. The following were to-day's auction prices:—*Mangalore* character, medium, to bold round pale, 3s. 10d.; medium size, 3s. 6d.; small to medium, 3s.; very small pale, 2s. 7d.; small to bold mixed brown, 2s. 6d. per lb. *Ceylon-Mysore* and *Ceylon-Malabar*: fine bold round pale, 3s. 11d., medium to bold good pale, 3s. 9d.; small to medium ditto, 3s. 1d. to 3s. 4d.; medium long pale mixed, 2s. 8d. to 2s. 10d.; small fair yellowish, long and round mixed, 2s. 7d. to 2s. 9d.; very small pale, 2s. 3d. to 2s. 4d.; partly opened brownish mixed, 2s. 1d. to 2s. 6d.; ordinary brown pickings, 1s. 10d. Cardamom seeds realised from 3s. 8d. to 4s., and medium to fair wild cardamoms from 2s. 6d. to 2s. 8d. per lb. One lot, however, was held at 3s. 6d. per lb.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, FEBRUARY 20, 1897.

[No. 4.

MANAGER'S NOTICE.

Numbers: A few odd back numbers of 1896 for sale at four annas each.

Back Number Wanted: One copy of No. 16, for which one rupee will be paid.

Offered: A few back numbers of 1896 at eight annas per copy.

N.B.—It is particularly requested that the names and addresses of the *senders* be legibly written on the covers of the papers despatched.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, at Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 27th March 1897.

Central Travancore.

PEERMAAD, 14th February.—*Weather.*—A few light showers have fallen, and show every signs of continuing, at which those who have new clearings to burn off will not be best pleased. *Crops.*—Tea should begin to flush better again now, especially if it continues. *General Health.*—Good. *Labour.*—Sufficient.

Coorg.

POLLIBETTA, 16th February.—*Weather.*—Fair with passing clouds; but threatening latterly, especially since the day before yesterday. There was a slight mizzle on the night of the 14th and this morning. It is hoped that the rain will keep off for a fortnight at the least, as there is still some pruning to be done and things are not quite ripe for the rain yet. *Crops.*—Some gleaning is still being done. Spike for next season coming nicely forward and prospects somewhat improved since pruning. *Plant-diseases.*—A sprinkling of diseased leaves still to be noticed, but matters much improved since pruning. Trees are wintering. *Labour.*—Sufficient, some being paid off shortly. *General Health.*—Some improvement, but fever and bowel complaints still prevalent.

S. E. Wynaad.

PUNDALUR, 16th February.—*Weather.*—Since my last report there is no change in the weather, but at intervals it is cloudy. On Sunday, the 14th instant, we had a few drizzles or say passing clouds. *Crops.*—Ragi 20 seers, cholum 20 seers, salt 7 seers, rice, 1st sort, 8 seers, and 2nd sort, 9 and 10 seers, per rupee. *Plant-diseases.*—Nil. *General Health.*—Good. *Labour.*—Fair. *Interesting Items.*—The vacant estates once known as Mr. Steedman's properties are being filled. Balcarres No. 1 is taken up by Mr. W. Ryan, Henrietta by Messrs. Sultan Mahomed Sahib & Co. of Ooty, Palmerston is applied for. There are plenty of lands which can be got from the Nellyalom Jemni, and the Karistan is a straightforward man, does his work quickly and honestly. Whoever wants land can apply direct.

Lower Pulneys.

AHTOOR, 15th February.—*Weather.*—Hot and dry until the afternoon when we had a sudden change. From then we have had light but steady rain to date, varying from 1 to 2 inches throughout the district. This will be good for the trees and help on the manure pitting which was becoming very difficult in the hard ground, but will bring out a small blossom, and I am much afraid turn any more we might have got into flush. We could very well have done without rain for another month. *Plant-diseases.*—Leaf-disease

HELPS & CO., Fashionable Tailors and Costumiers, 16, Old Court House Street, Calcutta. (Ladies' Department: 4, Russell Street.)

almost disappeared. A little green bug has been observed on some young coffee, but otherwise district is free from plant-diseases. *General Health*.—So far good. This rain will probably result in a few cases of fever. *Labour*.—Good. Locals a little short on account of grain harvest on the plains. Grain crops good generally on the E. and S. of the hills. *Interesting Items*.—Absolutely none. *Crops*.—Very nearly over, a little stripping still being pushed on with.

Nelliampathy.

16th February.—*Weather*.—Cloudy and rain every day since Sunday. Rain 1 inch. *Crops*.—(Rice) Grain 10 edingalies p. 1/. Gram 15 edingalies p. 1/. *Plant-diseases*.—Leaf still showing, but has gone off a bit on most places. *General Health*.—Lot of fever about, and this rain we have had will make it much worse. *Labour*.—Tamils almost all gone, but as many coolies as are wanted can be had, Moplas chiefly. *Interesting Items*.—None; district stale as ditch-water.

Nilgiris.

SHOLUR, 14th February.—No rain since last report. Drought now reckons from 23rd November 1896. Highest and lowest temperatures during fortnight between 6 A.M. and 6 P.M., 40° and 70° respectively. Pruned tea weaking out very freely and every prospect of early season. Labour very plentiful and health good. No diseases on tea this side, the signs of black bug having disappeared. Ragi 24 to 26 seers per rupee at Sholur village. P.S.—Since writing above, 34 cts. rain on Sunday, 14th instant.

COONOR, 18th February.—*Weather*.—Our winter broken up very suddenly by heavy showers on the 13th, 14th, 15th and 16th, totalling over 5½ inches. Will be simply grand for tea, but very bad for high elevation coffee. Even the lower elevation ones have not finished their pruning, but there an early blossom will be welcomed, as spike is forward. Last time we had this sort of weather was in 1891, when we had 11½ inches, almost, in 12 days. On tea the yield increased, as soon as the sun appeared, by 300%. For high elevation coffee, effect was very bad. *Crops*.—Coffee pruning not finished yet, and these showers will interfere sadly with work. The blossom that *does* come will be good for low elevations, whatever it may turn out for high. Leaf-disease passed off, leaving trees bare. Tea very healthy and will flush grandly when rains stop for good. Coffee crops turning out disappointing as expected, and outturn of parchment from cherry has proved generally very poor. "Feathering" or "nail pruning" will have to be studied on high-elevation gardens if the rain does not stop soon, as the spike will all go to leaf. *Wanted*. A substitute for *E. Lithosperma*, as this plant won't thrive at high elevations. Qualities required are quick growth, no thorns, soft wood, to stand any amount of cutting and to be a leguminous plant, i.e., bearing seed in pods like peas or beans. *General Health*.—Fair. *Labour*.—Generally speaking good. Curious thing this year is the wretched manner in which English fruits are setting their blossom. Some hold the peach blossom to be a species of warning as to the manner the coffee blossom will set. It might be taken by contraries, though. Last year we had a splendid peach crop: coffee crop wretched. This year peach crop will be a failure; wherefore, hope for a grand coffee year.

GENERAL NOTES AND ARTICLES.

A MODEL PLANTERS' ASSOCIATION.

For some months past there has been a growing desire amongst the planters of South India that their United Association, which has done such eminently useful work during the last few years in what may be termed the sphere of "planting politics," should turn its serious attention, as indeed it is now doing, to matters of more

immediate practical importance. With this feeling we in thorough accord and have, indeed, done what was in power to foster and strengthen it. A beginning has already been made, amongst other directions, in the matter of negotiating for the services of Professor Koebele, to investigate the pests that do such serious damage to our plantations. It has, we think, been proved beyond all reasonable doubt that Mr. Koebele's labours have practically saved the native coffee industry in the Sandwich Islands from annihilation. It is not unreasonable that South India may also hope to derive some benefit from similar work. Pursued to its logical conclusion the proposed Coffee Association will also, we trust, soon be an accomplished fact. There are many other directions in which scientific investigations might be carried on to the greatest possible practical benefit to the planting industry, and more than once we have sketched out lines on which they might be pursued. At the present day, agriculture almost all the world over, is receiving the most earnest attention capable scientists can give it, and it is more strange that the planting industries alone should be an exception.

It must not be thought for a moment that, in advocating special expert assistance, we look down upon what has already been done in carrying on investigations in the true scientific spirit by practical planters. The contrary is the case. That, in the midst of their busy rounds, with the greater portion of their time absorbed by purely routine work, they should have accomplished what they have, shows the possibilities of further success if the help of experts were available to pursue the work. Science alone will do little use, we mean that science which emanates from the laboratory full fledged, and untried by the only sure test that of practical trials. There must be a very close connection between science and practice, the laboratory and the field, if any real progress is to be expected. The motto of the Royal Agricultural Society of Great Britain—"Science with Practice," should be our own. After the preface, let us turn our attention to a country where the motto seems to have been adopted in a most thoroughly and strikingly successful manner.

We have already mentioned the invaluable assistance rendered by science to the coffee planters of the Sandwich Islands, but perhaps a more striking instance will be found in the unique state of prosperity that still attends the industry of those Islands in Hawaii. Everywhere else in the sugar colonies of the world, the staple industry is in a critical condition. Perhaps Natal and Queensland are only two exceptions, but even there things are by no means very flourishing. In the Mauritius, and especially the Indies, the crisis has already occurred, and sugar planters are at their wits' ends to know how to compete with the refined beet sugar in the London market. So urgent is the condition considered that a Commission is already at work in the West Indies, investigating their complaints, considering what can be done to relieve the distress in Hawaii, we learn that last year was a more than prosperous one, and that the majority of plantations largely increased their cultivation. To what causes this striking difference be ascribed? The soil and climate are equally favourable in both cases, and both again are free from similar disadvantages from an almost total lack

PHELPS & CO., Calcutta, have probably the largest and best assorted stock of Woollens in India and will be pleased to send patterns and form of self-measurement.

SHORT ADVERTISEMENTS.

NOTICE.

THE cost to subscribers of short advertisements is One Rupee for every three insertions of five lines or less. To non-subscribers a charge of Two rupees will be made.

N.B.—Advertisers should state exactly the number of insertions required, failing this the advertisement will continue running until stopped and will be charged for accordingly.

OFFERED.

Verarajendrapett, L. Coorg.

Boys' Own Paper. Five Vols. "Boys' Own Paper" (1889-94), in good order. Price Rs. 20; offers considered.

Apply XNAW., C/o Editor.

Coffee Shade Tree.

Sun-dried Erythrina lithosperma contains per ton:—

61.50 lbs. Nitrogen
57.38 „ Potash
14.92 „ Lime
13.68 „ Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis. Price Rs. 3 per 1,000.

This variety is the only thornless kind extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE,

SHENCOTTAH,
Tinnevely.

u. c.

Razors.

The undersigned undertakes to turn out old razors as good as new, i.e., with the perfection of a keen cutting edge guaranteed, for a small charge of eight annas and upwards, according to quality and temper of steel. The undersigned is importing the latest machine for this purpose.

The minimum charge will however be Re. 1 on each parcel of razors, postage extra. Do not allow any Native barber or knife grinder to touch your razors. They almost invariably spoil the temper, and although they may put on a keen edge, it will only last for one or two shaves.

A. R. ROSLING & CO.,
MILLER'S ROAD,
Bangalore.

Tinnevely District.

There are so many cheap imitations of Ellwood's helmets in the market that it is a comfort to know that PHELPS & CO. keep Ellwood's only.

our, the plantation hands having to be imported over sea from India, Japan and China. Why should Hawaiian planters be able to succeed where the West Indian gives up in despair? We think the whole answer lies in the fact that in the West Indies scientific co-operation is almost unknown, while in Hawaii it appears to have reached its fullest development. The sugar planters of Hawaii have organised a most powerful association, a body that has been in existence for nearly fifteen years. The help it renders to the industry is enormous, while the need of such assistance is perhaps more urgent than in any other planting industry in existence. The processes of sugar extraction from the raw cane are complicated in the highest degree, and necessitate the employment of delicate scientific tests, aided by very elaborate machinery. It is out of the power of any single planter or even company to keep abreast of the latest improvements, but, banded together, the task has been accomplished with a full measure of success. The last annual report of the Association gives a clear idea of the lines on which it is worked, and the methods employed that have rendered Hawaii perhaps the premier sugar colony of the world.

Elsewhere, as we have pointed out, the cultivation of cane sugar has been steadily declining during the past few years. Ten years ago the export from Hawaii was only 108,000 tons, five years ago it had risen to 137,000 tons, and last year the export reached over 225,000 tons, an eloquent testimony to the prosperity of the industry. The scientific department, an unusually complete one, of the Association is shown by the report to have been hard at work, and special mention is made of the valuable services it rendered the planters. A start had also been made in a line we have repeatedly urged on our readers, *i.e.*, the carrying out of practical agricultural experiments under competent supervision; in other words, an experimental garden. There is no talk of the advisability of securing the services of a competent chemist for our tea industry. "Sugar chemists" have a place in almost every large sugar factory in Hawaii. There is the most thorough exchange of experiences among the sugar planters regarding the practical working of the latest machinery, so that any little improvement is eagerly adopted and comes into immediate general use. An important branch is that of the chemical and physical analysis of soils and manures, arranged through the agency of the Association. We note by the way that Prof. Koebele is no longer able to place his sole services at the disposal of the planters, though as etymologist to the country he will be able to render valuable help and advice on occasion. The income of the Association amounts to about 17,500 dollars, based by a uniform assessment on the sugar production of each estate. In the General Report are included special reports dealing in detail with every branch of the industry, from the field to the market. We note first the Report of the Honourable Committee, which is brief but hopeful, and expresses general satisfaction at the large increase in Japanese and Chinese coolies. According to the Government regulations, beginning is also to be made in introducing European labour. Then follows an elaborate report on machinery, which affords a great amount of most valuable technical instructions. Next we read of the work done by the Laboratory and Experiment station, which is apparently managed through, or with the assistance of, the local Government. This report is of absorbing interest, and we

purpose making lengthy extracts in a future issue, which cannot fail to be of much practical use to the more thoughtful of our readers. The key-note of the work of the Experimental Department was to the effect that, although the general laws of agricultural chemistry were available to everyone through the medium of text-books and primers, yet that local conditions so seriously affected the deductions to be drawn from these laws as to render local experiments of the utmost value and moment. Here, in a nutshell, lies the whole crux of the value of scientific knowledge and research. The practical rule-of-thumb planter sneers at scientific agriculture imported from Europe, and asserts, with a great deal of truth, that to argue from corn to coffee will land one into palpable absurdities. The "scientific planter" on the other hand laughs at the other's old-fashioned notions, and declares that the laws of science apply with like force from pole to pole. Both are partially right and as equally wrong. Local conditions are factors of extreme importance, and yet not so powerful as to wholly render neutral deductions drawn from different countries and modes of agriculture. To accurately determine just how far these conditions affect the basal laws of plant life and culture, is the proper work of experts. And that such work is admirably carried on is clearly shown by the admirable reports on Soil, Cultivation, Fertilization and Manufacture above alluded to.

Such, in brief, is the work done for its members by the Hawaiian Sugar Planters' Association, the results being shown in the unique prosperity of an industry which, outside of these Islands, is all but ruined. To similarly help and direct the coffee and tea planters of Southern India, through every branch of the industry from the clearing of the land to the sale of the prepared article, is the work before their United Association. It has entered on this work with no halting step; great success has already attended its efforts. And given the hearty and thorough support of each individual planter, which it so well deserves, it will not be long, we trust, ere it becomes a worthy rival to the "Model Planters' Association" which we have cited as an example to be followed.

Rhea.

That Rhea fibre is commencing to make its existence practically felt in England appears certain from the fact that a large advertisement appears in the *Textile Recorder* announcing that the Castleton Silk Mills at Rochdale are now offering yarns spun from this fibre, or from this fibre ingrained with silk and wool in a wide range of counts.

Cocoa.

Somehow the climate of Ceylon does not seem to agree with fruit-bearing trees at all. First coffee went out entirely, now there are rumours of serious disease in old cocoa. The prices of Ceylon cocoa for this year, however, says an exchange, are not unsatisfactory:—

	1896.	1895.	1894.
Good red	...55/ to 75/	55/ to 63/ .	60/ to 70/
	1893.	1892.	1891.
Do.	...80/ to 90/	107/ to 123/	103/ to 110/

Inoculation of insect pests.

A valued scientific correspondent from Assam writes us:—

I have been perusing U. S. Entomo. Bulletins, etc., and trying to

It is not too much to say that PHELPS & CO. are the most popular high-class Tailors in India.

obtain information as to the propagation of fungoid diseases on insect pests. Excepting the claims put forward as to its use in the case of the Chinch Bug [published some months ago in this paper.—Ed.], the idea does not work out so well in practice as its theoretical advocates state. It would seem that a fungoid disease has been found on a scale insect, namely the San Jose scale (*Aspidiotus perniciosus*). This and the matter in general is to receive the further attention of the U. S. Department this coming season.

Planting in Perak. Labour in this country is a good deal more expensive than in South India, but the land itself being cheaper and the soil climate magnificent for Liberian coffee, planting pays perhaps as well there as here. Outstanding advances are no longer the great bugbear they used to be, and are recovered in one or two years without much difficulty. Tamil coolies are being imported in increasing numbers, and they are thoroughly appreciated. Cocoanuts also do well, the yield per tree being exceptionally good.

The Agricultural Ledger.

Among the last batch received of this valuable series is a pamphlet on cinnamon leaves, a portion of which we may reproduce in another issue. There are also numbers on Jute, Rep (reclamation of salt-saturated lands), Atis (a drug used in fevers), and lastly a very interesting batch of correspondence on Bow String Hemp (*Sansevieria zeylanica*), as a secondary or catch-crop to tea-planters.

The cultivation of this hemp is extremely simple, and as it already commands a ready sale at home for cordage, etc., the market is assured. The plant is a native of the Wynaad and can therefore be easily procured by South Indian planters, who should be able to find it a valuable auxiliary. We intend publishing the pamphlet *in extenso* in our next issue.

Almanacs and Calendars.

It's a little late in the day to mention these, but better late than never. The most important perhaps is the Travancore Almanac for 1897, being a neatly printed and well indexed voluminous Directory on all matters of interest to residents of the "Model State." Among the many wall calendars for use and ornament, the one issued by Messrs. Addison & Co. ranks easily first for utility, while the Glendale Tea Estate, Coonoor, comes as much to the fore in the way of artistic beauty. Messrs. Child and Co., the Calcutta tobacconists, also send us a bright wall calendar, portraying two young ladies of striking complexions.

Last on the list comes Messrs. Davidson & Co.'s "Sirocco" office blotting pad and diary, which also serves the usual purpose of a trade list for their ingenious and varied tea machinery. A calendar is also inserted, and the *tout-ensemble* forms a handsome and very useful office blotter.

Prunings and disease.

Referring to the extract on "Finger and Toe in Turnips," in which we lately based some lengthy remarks, an old Ceylon planter, writing to one of the local journals, says:—

"After reading these, I think few men could continue that objectionable habit of poisoning the soil, by burying tea prunings: burn and manure with the ashes if you like; but failing this, leave them on the ground, the sun will very soon destroy any harmful matter [Will it? We very seriously doubt it.—Ed., P. O.], and the leaf covering left on the ground is beneficial in retaining moisture, and preventing wash.

Cacao Planters will learn in time to pay attention to the refuse of the pods after taking out the beans. [This would apply with equal or greater force to coffee pulp.—Ed.] It is a source of danger always; the only safe way to deal with it is to throw it all into a pit, and cover with a good dressing of quicklime, a supply of which should always be on hand during the crop season, but must be freshly burnt.

If it takes 5 or 6 years to destroy the harmful effects of refuse from the turnip shed, what must be the results of burying coffee husks, almost fresh, year after year in the same soil, and to the same tree;—quite sufficient to account for the serious bark disease which we hear so little, but which is doing incalculable harm to the Cacao Industry.

Lady-birds and their parasites.

In referring to Mr. H. O. Newport's interesting "Notes on Lady-birds and Coffee-Bug on the Low Pulneys," reprinted in the *Tropical Agriculturist* from a paper, Mr. E. E. Green of Eton, Pundaluoya, Ceylon, writes to the *Ceylon Observer*:—

Mr. Newport, however, reports that though the beetles are doing good work in a small way, they are not increasing in number rapidly as could be wished. This is only what might be expected from an indigenous insect which has no doubt its own natural enemies to keep it in check in its native country. But it has struck me that this same Indian beetle, if introduced into Ceylon, might have a freer hand and might prove a real service on the few coffee plantations remaining in Ceylon. This little experiment would, any rate, be inexpensive and easily carried out. I should be glad to correspond with Mr. Newport with a view to the interchange of natural enemies of insect pests between India and Ceylon. We on our side, might be able to supply the Indian planters with a species which—hampered by their own parasites—are unable to do appreciable service in this country, but which if sent to India—minus their enemies—might increase as the Australian beetles did in Hawaii.

This is, however, no easy matter to do, and we venture to doubt whether it would be wise experimenting in this direction without expert assistance.

District Associations.

Among the matters of special interest in the reports of proceedings of the various Planting Associations printed elsewhere, readers should carefully note the valuable instructions and maistry-cum-cooly agreements in the Wynaad report. Recent rulings seem to have placed it beyond question that the form of agreement made between maistry and cooly is usually wrongly drawn up, and greatly interferes, if it does not do away with altogether, the hold of the maistry on the cooly. In the North Travancore (Kanan Devanahillay) report, we notice a somewhat novel resolution on the subject of estate notes. The Consolidated Tea and Lands Company possess the major portion of the land in this district, and their estates are allowed each a vote, but the total number of votes is very wisely limited to only equal those held by estates not the property of the Company. Returning again to the Wynaad meeting, we confess ourselves sorely puzzled by the apparent scruples of the majority of planters towards giving the details of acreage, crop, labour, etc., desired by the U. P. A. Surely by using the term "inquisitorial," the Association does not imagine that the returns will be used by Government for purposes of increased taxation? A deplorable lack of ability this to understand the value of statistics.

A hint for Planters' Associations.

Some three or four years ago the Nilgiri Planters' Association formed a sub-committee to deal with

They have no pretensions to cheapness, nor do they advance any such claims, but PHELPS understand their business.

No. 15 Am willing to pay One Rupee for a copy of
Planting Opinion. this issue.
 "NUMBER FIFTEEN,"
 C/o Manager.

Wanted Tiger and Leopard Skins complete
 with skull and claws.
 Apply J. HENRY & CO.,
 Calcutta.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better one
 in want of a manager, assistant, or writer, &c., is entitled to insert an
 advertisement to that effect free for as long a period as desired. These
 advertisements will appear on this page. Non-subscribers will be charged
 the small fee of one rupee.

To be worked in conjunction with the above, we have established a
 register, and names will be entered on application, together with copies of
 their testimonials. Thus should any enquiries be made for the services of
 a manager, assistant, &c., the names and testimonials will at once be for-
 warded, saving delay and trouble. Subscribers may have their names
 entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO.

Writer. Wanted a Writer for Field work only, must have
 a thorough knowledge of coffee, keep a rough roll,
 and have a good labour connection. None need apply unless they have
 the latter. Apply A. MORGAN, Kil Kotagiri, Nilgiris.

English Graduate. An English graduate and the son of a General
 Officer desires an engagement. Address
 No. TEN,
 C/ of this Journal.

Field Overseers. Field Overseers from November 1896 in opening
 new clearing. Salary Rs. 20 to 25 per mensem.
 Applications only need apply.
 Apply to A. H. SHARP, Esq.,
 Devikulam.

Coffee Writer. Wanted on a Coffee Estate an Under-Writer
 who understands field work and accounts. Must
 be young, active, and willing. Must speak and write English well.
 A labour connection is necessary. No one without these qualifications
 need apply. Good salary.
 M. A. T., C/o this paper.

BILLETS WANTED BY.

European gentleman. WANTED—Employment by a European
 gentleman of experience, on a Coffee Estate.
 Willing to start on small salary. Has good know-
 ledge of Tamil, Canarese and Hindustani.
 Apply to "EPAMINONDAS,"
 C/o this Paper.

Manager. WANTED a situation of trust as manager by a
 European Gentleman with over 10 years' experi-
 ence in Coffee or Tea. A temporary billet for say 6 months, Rs. 400;
 permanent Rs. 250 per mensem at first.
 Apply F. O. B., C/o Manager.

By young European Planter. WANTED employment as Manager or Superin-
 tendent of a Coffee Estate. Five years' practical
 Experience in South Mysore. Excellent Testi-
 monials. Salary Rs. 150.
 Apply E. P. L.,
 C/o Editor.

Young Tea Planter. WANTED position of Trust or Assistant on a
 Tea or Coffee Estate in S. India. Has had two
 years' experience in Assam. Is willing to work 6 months without a salary
 till he has learnt local conditions. Good references.
 "A. K.,"
 C/o Editor.

A Surveyor.

Of 25 years' experience, trained in the Imperial
 Survey Department of India and Engineering
 College, Roorkee, is prepared to undertake extensive Trigonometrical,
 Topographical and Engineering Surveys and Levelling and make working
 plans on the largest scale at somewhat the same rates as the Government
 Cadastral Surveys which will vary with the area and scale of the survey
 and amount of detail required.

Full particulars on application to

A. HALL,

Three.

C/o Editor.

Tea or Fruit.

WANTED an appointment as Manager or First
 Assistant in tea or fruit. Ten years' practical
 experience, well up in the cultivation and manufacture of tea, and also in
 the management of English fruit trees. Bachelor, age 29, active, hard
 working, sober habits, excellent testimonials and information from the
 Manager of this paper. Can join at once.

KUMA.

Coffee Planter.

WANTED a situation in Coffee as Superintendent
 or Manager by a European with over twenty
 years' experience.

Apply D.,

u. c.

C/o Manager.

Superintendent.

WANTED a billet as Superintendent of a Coffee
 Estate by a planter of 14 years' experience;
 testimonials and references given if required.

Apply PADDY,

Case of 100 sq. ft.	14	0
---------------------	----	---

In rolls of 60 feet long x 3 feet wide.
Fine Machine made Yarn. Quality

A quantity of Mining Plant and sundries on hand for sale. A price list giving details and values will be forwarded on application. Open inspection and offers.

Sulphate of Ammonia 2

bullocks, etc.

Quotations will be obtained and orders booked for Basic Slag or Phosphate, Kainit Salts, Muriate of Potash, Nitrate of Potash, Sulphat Potash, Saltpetre, Superphosphates of Lime, 15% Phosphoric Acid, Superphosphates 40%, Soluble Phosphates, and any other Manures not kept in stock. Approximate Analyses of these can be had on application.

LONDON OFFICE :

14 Billiter Street, E.C.

methods of arresting the ravages of pests on tea-plantations. The outcome was a certain amount of very valuable practical information, which in not a few cases has resulted in the yearly saving of some hundreds of rupees. The Shevaroy Association also, at about the same time, made a beginning in somewhat the same direction, and the valuable practical papers on systems of drainage must have been of great use to the members. It would be a most excellent thing if permanent sub-committees were formed in each District Association in South India, whose object would be to collect and prepare all available information in their district, bearing on the best methods in vogue for the different practical estate-works. It would be of use if the subjects to be taken up were chosen by the U. P. A. Committee, so that a uniform series of investigations might proceed simultaneously in the various districts. This would render possible an extremely interesting means of comparison between the different districts. It is obvious that certain broad local conditions could be also given in each case. Take for instance the subject of chemical manuring, which perhaps ranks as first in importance of any branch of planting. A porous soil, with a moderate rainfall, must obviously receive different treatment in this matter to that adopted in a heavy clayey soil and excessive rainfall.

Partial analysis.

We trust that when once the question of Funds is satisfactorily settled, the U. P. A. will take immediate steps to induce a competent agricultural chemist to take up the work of analysing soils and manures for its members. The prices charged by resident firms in South India are prohibitive, mainly due to the inability to grasp the needs of planters. Full and complete analysis is without doubt a most elaborate, and necessarily costly, investigation. But is it necessary that *complete* analysis should always be furnished? We throw not. Doubtless from a purely scientific standpoint it were highly desirable that analyses should invariably be as complete as possible. But practical agriculture is, yet, content with very little. A planter, in wishing to have a sample of manure analysed, as a very general rule only wants to know the proportions of the four important elements: nitrogen, phosphoric acid, potash and lime. The soluble silica, and insoluble silica, chloride of sodium, salt, sulphuric acid, carbonic acid, magnesia: what does he profit from knowing the exact number of decimals that go to each of these?

It would be highly desirable therefore that, either that the resident firms should fall in with the views of their constituents and charge, say, half rates for such partial analysis as indicated, or that the U. P. A. should import a special chemist for this and similar purposes. A planter writes that he enquired the cost of ascertaining simply the soluble ash and moisture of a certain product, and was told that he would be charged Rs. 20 per each sample! We have it on very competent authority that Rs. 5 would be more than a fair price to be charged for such work.

Mr. Chas. Ledger.

Some time ago we published an account of the unsuccessful efforts of Mr. Ledger to obtain a pension or additional gratuity from the Dutch Government, on account of the splendid

services he rendered them in procuring cinchona seed of the variety now named after him. We now are pleased to note that the efforts of his friends, and especially those of the *Chemist and Druggist*, have resulted in a pension of £100 per annum being allowed him. We extract the following from our contemporary:—

"The influence of the Press has been illustrated in a somewhat remarkable manner, in the case of our own journal, by the grant of an annual pension of £100 to Mr. Charles Ledger by the Government of the Netherlands. Thirty-one years ago Mr. Ledger, with much trouble, and at great personal risk, collected in Bolivia and brought Home to Europe a supply of the cinchona-seed called after him—*Ledgeriana*. The Dutch Government bought the seed outright for about £150. From this seed the bulk of the Java cinchona-plantations, which have yielded millions of profit, was raised. Meanwhile Ledger disappeared. He was supposed to have died years ago in South America, when a letter was received by us stating that he survived, and lived in a back block of New South Wales in great poverty. He had come across a stray copy of the *Chemist and Druggist* containing a statement about coca, and wrote to us to criticise that statement. It happened that two other cinchona pioneers, an Englishman and a German, had just died, and we asked Mr. Ledger for some of his own reminiscences. Then we tried, together with Mr. (now Sir) Clements R. Markham, F.R.S., President of the Royal Geographical Society, to raise a subscription for Mr. Ledger among those who had benefited by his venture. The attempt failed. Mr. Ledger applied to the Dutch Government for some further recognition of his services. It was refused. We enlisted the assistance of an influential Dutch newspaper on his behalf, but in vain. Mr. Ledger's friends, however, kept arguing his claims with persistence; we wrote to the Ministry of the Colonies in the Hague, and now, after eighteen months of pegging away, the Dutch Parliament has at last recognised the justice of Mr. Ledger's claim and granted him the pension which we hope he may long live to enjoy, though he is already in his seventy-ninth year."

PLANTERS AND THE FAMINE.

We publish below a stirring appeal sent us by the Secretary of the U. P. A., to the Planters of South India, on behalf of the famine-stricken population of Upper India. We thoroughly believe the reply will be immediate and generous. Short crops and high exchange may render the amount each of us can spare less than in more prosperous years. But let every single planter, proprietor, manager or superintendent, do his utmost to uphold the fair name and fame of Planter, by contributing his quota. The appeal has been noticed with great sympathy and gratitude by the Native Press. Let us show by a ready response that our sympathy for the masses of India, by whose aid we have attained what prosperity we have achieved, is as deep as their bitter need:—

AN APPEAL TO THE PLANTERS OF SOUTHERN INDIA.

The Committee of the U. P. A. S. I. have decided to appeal to all Planters in Southern India (as far as possible, through the medium of the several District Planting Associations) for subscriptions and donations towards a Planters' branch of the Indian Famine Charitable Relief Fund that has now been opened.

It was suggested that money for this purpose might be taken from the U. P. A. Reserve Fund, but there is a strong feeling that this Fund, which constitutes a Trust, could not be rightly drawn upon for any such object. Writing with reference to this, the Chairman observes:—"As the Hon'ble Mr. Hodgson said, 'I have never known a Planter turn his back on a Subscription List opened in a good cause,' and I believe we shall raise a far larger amount by calling for donations than by paying down a sum from the Reserve. A better cause for liberality will never occur." Mr. Acworth remarks also:—"All should subscribe, poor and rich, Proprietor and Superintendent alike. A donation of Rs. 5 from him who can afford no more will be as welcome as that of Rs. 1,000 from the wealthy Proprietor. The Government of India has lately shown its sympathy with us in readily granting our petition for a Commission of Enquiry into our grievances. Let us now prove our gratitude by doing all in our power to assist that Government in combating one of the greatest calamities of modern times."

HELPS & CO. rely on excellence of workmanship and good taste in building up the biggest Tailoring trade in India.

Giving practical proof of his earnestness in this matter, Mr. Acworth has put his name down for a donation of Rs. 200. If others will follow this example in the spirit that has animated the Chairman, a Fund will be raised that will be of material assistance to the Government and will reflect credit upon the Planting community, while also serving to prove the oft-repeated assertion that this is not merely powerful and influential, but has the welfare of the country sincerely at heart.

The Secretary would remind all Planters that, though the Madras Presidency is free from actual famine, and is not expected to suffer from anything more serious than acute distress in two or three districts, the North-West Provinces and the Central Provinces are afflicted with wide-spread and intense scarcity of crops. In 1876-78, when this Presidency was devastated by Famine in its most severe form, all India came to the rescue, and the North was liberal in its assistance to the stricken South. The time has now arrived for this Presidency to reciprocate, not merely with sympathy but with practical and material aid. Planters are appealed to in the confident hope that they will realize that when any portion of the Indian Empire comes under the dire shadow of Famine, it is the duty of every citizen of that Empire to contribute to the best of his ability towards the Fund raised for the relief of the distressed. This is a case that should meet with a specially ready response from the Planter, who, as a tiller of the soil himself, can fully appreciate the sad position of the helpless agriculturist, to whom the earth has refused to yield the usual supplies.

The Secretary ventures to suggest that while rich donors may prefer to give lump sums at once, poorer men may find it more convenient to subscribe, month by month, some small amount, which, when repeated many times, will do much to swell the total raised. He is prepared, therefore, to open a list of *Monthly Subscriptions* as well as a list of *Donations*, and he trusts that both will soon contain many names. Planters have numerous Subscription Lists already before them, and many have only poor crops to look forward to. Yet the gravity of the present distress is so great, that a considerable amount of personal inconvenience and self-sacrifice should be cheerfully submitted to. Fortunately, the scourge of Famine visits India less frequently than of old, and the present call for help will certainly not be often repeated. This should be an extra inducement to liberality on the present occasion.

It goes without saying that the more prompt the aid, the greater its effectiveness. The Secretary trusts, therefore, that individual Planters will promptly send in their Donations or Subscriptions to the local District Planting Association or to the U. P. A. by which they will be passed on to the Provincial Committee of the Famine Charitable Relief Fund.

UNITED PLANTERS' ASSOCIATION
OF SOUTHERN INDIA,
MADRAS, 12th February 1897.

HARRY ORMEROD,
Secretary, U.P.A.S.I.

JADOO CRITICISED.

"TODA" writes as follows, under date of 13th instant:

As you published Colonel Halford Thompson's letter, which appeared in the *Madras Mail* of 12th January, criticising a letter of mine *re* Jadoo Fibre, which was inserted in the *Mail* of 19th November 1896, I would ask you in fairness to kindly publish in the next issue of *Planting Opinion*, my reply to Colonel Halford Thompson's letter which you will find in the *Madras Mail* of 4th February, signed "Toda."

We regret we have not sufficient space to quote the letter in full, which occupies a full column of very small print in our contemporary, but we trust "Toda" will find the omissions in no way impair the weight of his crushing rejoinder.

Colonel Thompson says: "It is difficult to conceive how £7-10-0 per ton at Madras (now reduced to £7) could by any means swell to Rs. 170." Messrs. Parry and Co. tell me they can supply the fibre at Rs. 7 per bale of 1 cwt., on rail at Madras. Add another Rs. 30 for cost of carriage, (a fair estimate, seeing that the majority of estates are many miles from a Railway Station,) and the present price comes to Rs. 170 per ton. In Colonel Thompson's prospectus it was claimed that Jadoo fibre would be useful in two ways, so far as coffee planting was concerned. (i) In the "raising of nursery plants." (ii) In "bringing on supplies," and with these uses I dealt in my original letter. In regard to the first I said "now as to the cost of raising nursery plants." The prospectus states that a 3 bushel sack of Jadoo should be sufficient for 'raising 450 (nursery) plants.' The ton is said to contain 60 bushels, so that the cost per plant would be about $3\frac{1}{2}$ pies. This means an expenditure of—

about—Rs. 1,650 on the purchase of Jadoo alone, in the case nursery for a 50 acre clearing, planted $5' \times 5'$." Colonel Thompson says this calculation is wrong because I "have taken the quantity of Jadoo required for a seed bed large enough to raise 450 seedlings at a time"—it will be observed that Colonel Thompson admits the quantity given in the prospectus, a 3 bushel sack for 450 seedlings, is correct—" (but which could be used again and again so 20,000 seedlings could be raised from it) as the basis of a calculation based upon the original 450 seedlings being the whole quantity, could be raised out of that amount of Jadoo." The circular says nothing about the possibility of using a given quantity of Jadoo "again and again," but this does not affect my calculation in the smallest degree. If it takes a 3 bushel sack to raise 450 seedlings (as Colonel Thompson admits) then, with the price of a ton at Rs. 170, each seedling would cost $3\frac{1}{2}$ pies, and a nursery for a 50 acre clearing planted $5' \times 5'$ would entail an expenditure of Rs. 1,650. Colonel Thompson draws an alluring picture. You buy a 3 bushel sack of Jadoo, and raise your 450 seedlings by its aid every year for the term of your natural life. Then you leave it to your successors as an heirloom, who do the same, and so on to the end of doom. The only drawback is that as a 50 acre clearing would require a nursery of 90,000 plants as a minimum, and as you can only raise a nursery once a year, it would, at the rate of 450 plants per annum, take about 200 years to plant the clearing up. The light that Colonel Thompson throws on Jadoo, viz., that it can be used for a series of years as it does not lose its efficacy, would of course reduce the cost of a nursery in subsequent years, so far as the purchase of Jadoo is concerned. Before I leave this question I would add that it is "difficult" for one not in the know "to conceive" how Jadoo can be used again and again. The testimony printed with the prospectus, and those given in the *Madras Mail* of the 9th December, imply that, when Jadoo is used in a nursery, it encourages root growth in a wonderful way, and that, when seedlings are large enough to be put out in the field, the fibrous mass of fibrous roots. How then is the fibre to be retained for future use, without serious injury to these fibrous roots? I trust Colonel Thompson will make this point clear. With regard to the second use I said (I quote from my original letter), "But the figures pale into insignificance before the cost of 'bringing on supplies.' The prospectus gives $\frac{3}{4}$ peck as the quantity each seedling should receive.

= $\frac{3}{16}$ bushel,
or, say, 1 bushel for 5 plants,
= 1 ton for 300 plants,
= 9 ans. per plant."

On this head Colonel Thompson says "the amount of Jadoo required for raising seedlings in beds to supply 50 acres would be certainly not more than 5 cwt. and would cost therefore Rs. 1,650 instead of Rs. 1,650 as calculated by 'Toda.'" Every word of this sentence is inaccurate, and it is here that Colonel Thompson passes into a state of more "hopeless confusion" than anywhere else in his letter. In the first place I never said that "the cost of raising seedlings in beds to supply 50 acres would be Rs. 1,650." My calculation in which those figures were given had reference to the cost of a nursery for planting up a 50 acre opening. Colonel Thompson is evidently unable to distinguish between planting a new clearing, and supplying an old estate. (Query. Has he ever seen a coffee estate?). Further the large quantity of Jadoo— $\frac{3}{4}$ peck—given in the prospectus as the amount necessary for each seedling shows clearly that the prospectus did not contemplate the "raising of seedlings in beds" as supplies. It meant that that amount of Jadoo should be applied to each supply in the field. Again it is not in the power of Colonel Thompson or anyone else to say the amount of Jadoo required for "raising seedlings in beds to supply 50 acres would be certainly not more than 5 cwt."—or, fixed amount, for the simple reason that "supplying" is a variable quantity. Granting that $\frac{3}{4}$ peck is the right amount of Jadoo for each supply (and Colonel Thompson does not deny it), how many plants would 5 cwt.—the amount fixed by Colonel Thompson—be sufficient for a 50 acre clearing—cover? The ton contains 20 bushels, so 5 cwt. would contain $\frac{1}{4}$ of this or 5 bushels. 5 bushels for 5 plants, this would mean $(5 \times 15) = 75$ supplies. A 50 acre clearing (lucky dog!) might need only 75 supplies while B's clearing of a similar extent might need 7,500. What becomes of Colonel Thompson's fixed price of Rs. 42-8 for supplying 50 acres? On the lines marked out by Colonel Thompson

If their representative has not been in your station recently, PHELPS & CO. will be happy to send him—anywhere, from Quetta to Mandalay.

THE MADRAS EQUITABLE ASSURANCE SOCIETY

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ...Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.,)
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} for payment of death claims.

On Policies transferred to the London Register, death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Draft on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years, Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

possible to arrive at any definite conclusion as to cost of supply. My calculation is the correct one, viz., that if it takes $\frac{3}{4}$ peck supply, then it costs 9 ans. per plant, with Jadoo at Rs. 170 ton. One thing is obvious from Colonel Thompson's letter that, never great his theoretical knowledge of the merits of Jadoo may be, he knows absolutely nothing about its practical application to coffee. The figures given in the Jadoo prospectus are either right or wrong (and Colonel Thompson in his letter implies they are right). These figures are a 3 bushel sack of Jadoo for 450 plants in the case of a nursery, and $\frac{3}{4}$ peck for each supply (to be applied of course in the field). If these quantities are right, my calculations are right, in spite of the tissue of nonsense contained in Colonel Thompson's letter. If they are wrong, the sooner Messrs. Parry & Co. (who have a practical knowledge of coffee planting) correct them, the better for everyone interested in the question of Jadoo coffee.

WEST INDIAN COCOA.

LOOKING around us, our industries present a very gloomy aspect under the existing order of affairs, but, as I said fifty-five years ago, I venture to say to-day, we may work better than we do, and surely the rigid training we have had in the school of adversity during the greater part of the last half-century should open our eyes to what others are doing, and sharpen our wits to cope with and excel them too.

Grenada, following the example of her near neighbour, Trinidad, some years ago verged from sugar lines to Cocoa, in which commodity both places have extended cultivations, until the cocoa industry becomes the order of the day.

Having any knowledge ever of the rapid strides obtained by agricultural and manufacturing processes in the world, where capital views and available funds are judiciously brought to bear on any industry, one is fairly puzzled at finding men claiming the possession of intelligence, yet making no effort to improve their methods, and quite indifferent to results, present and future; but matters are still worse, when taking a retrospect of sugar production a half century ago we find growers, when scientific measures were but little known, and certainly never applied to the culture, fertilizers only obtainable from composts of their own rude manufacture, agricultural implements unheard of, and void of thousand-and-one convenient appliances now at hand, turning out four tons of muscavado to the acre, while in the present age of advancement with teeming volumes of literature shedding light at every point, we often find it turning out but one, and even less. Surely we are better able now to make our land yield a more bountiful return than in the past.

In order to further the objects leading to this paper, I desire to review the detailed cost for culture of an acre of cane for sugar, and in doing so I will suppose I am dealing with land in the state of copse, with perhaps some sturdy saplings scattered about. The word clearing must be understood as not referring to the extraction of roots, the practice being that large stumps, about three feet high, remain through first plantings.

Cost as follows:—Clearing, ten shillings; tillage by fork, paid at thirty square rods for one shilling, say fifteen shillings; drainage, at twelve feet apart, two feet wide, one foot deep, at one shilling per rod, say thirty shillings. Holing, twelve shillings; carting and hauling plants, planting and supplying, eight shillings; weeding, sixty shillings; raising and supplying home-made manure, sixty shillings; miscellaneous items, five shillings. It is plain that an acre may be grown at a cost of ten pounds. If the condition be that of forest, add one pound to the estimate, and of this at least one-half may be reconped by the adoption of measures I shall presently point to, but taking it at £10, and output three tons of muscovado, in lieu of the former time four acre, at selling price of £10 per ton, from which

strike even £2 for manufacture, would leave a margin of £14 per acre.

When a grower who is not possessed of manufacturing works is ready for reaping he cuts his cane and ties it in small bundles, and some neighbouring mill-owner sends for it, and manufactures for half of the sugar, latter paying subsequent cost.

Value of land of course differs widely under various circumstances, such as locality, nature of soil, formation, agricultural conditions, etc., but at the present day thousands of acres may be found here, and perhaps with the exception of Barbados, in all of these Colonies, at a mean average of (putting it high) £5 per acre, which in tracts of say 200 acres or thereabouts, would include cultivated with bearing crops, uncultivated, forest, etc., and very probably some sort of residence, if not other fabrics, while Government grants may be obtained at £1, or less, per acre, with nominal deposits.

Now, the looked for yield of cocoa may be placed at five bags per acre, an average of 180 pounds each, worth in local market, at this time of low rate, 3d. per pound, and in England £3 per bag. On the point of yield there is great diversity of opinion, many more acres yield two, than five bags, while there are instances of seven and even eight in localities said to be real cocoa land, but I think the difference comes as much, if not more, from *treatment bestowed on soil*; I know of a solitary instance where the output is said to be ten bags to the acre, and a place too, proverbial for former poverty of soil, but the secret is, or secrets are, first the Proprietor is resident, and management conducted under his eye, a portion of the estate below water sources is irrigated, and last, but not least, there is a cart continually hauling manure from the stables in town about three miles distant, while manuring cocoa generally in the island is not much followed up. I have visited the spot when cocoa was in full bear, and I must admit I have never seen trees so laden, or apparently keeping their pods so well.

In order to arrive at some accuracy in estimation of yield, I would take mean average between two and ten bags, as it is plain that the soil can give it, if rightly dealt with, so I will count six bags at £3, the cost of up-keep from time of trees maturity, together with reaping, is generally supposed to be 10s. a bag. These figures then go to show that one possessed of 100 acres of good bearing cocoa, may expect an annual receipt of £1,500, from which strike £100 to cover expenses of bags for shipment, Insular transport, taxes, etc., nothing more comes in that I am aware of, save, perhaps, up-keep of a couple of mules, and an overseer's salary, which another £100 would amply cover.

The chief drawback to cocoa culture is that one cannot see their money back for five or six years; except on the wise system pursued in Jamaica, where it is said, that when the cocoa has matured, the field has made more money at the same time on production of banana, and which policy is open to all, for if even geographically precluded from extensive commerce in the fruit of the banana or plantain tree, it is highly probable that the fibre, which is produced in large quantities, may be made a source of profit if in the hands of those capable of placing it on the economical lines of an industry, added to which, judging by the numerous articles we read of late on the subject, there may be some hopeful prospect in banana flour soon becoming an important branch of commerce.

There are of course numerous other fibres that may be quite as profitable, which I am not prepared to deal with, but in the absence of all this, as at present, the many edibles including plantains that are now imperfectly cultivated on the spaces intervening the young cocoa plants, become extremely helpful in domestic requirements, and I am convinced if brought under some regimen of agricultural order, could very materially

is so well-known now that Messrs. PHELPS & CO.'s prices, notwithstanding that they are considered high, are so much below those of London, that their trade is advancing by leaps and bounds.

cheapen the populations' food, and if not totally dispense with the vast importation of stuffs grown in America, unquestionably curtail it to a considerable extent. Other products I think indisputably deserve careful deliberation, and I can see no possible doubt of their claim to commodities of export order, among which I will choose three as having some knowledge of, by practical experiments.

Firstly, tobacco, I have successfully grown the weed, and obtained in some descriptions leaves measuring thirty-three inches long, trees averaging six ounces when cured, and yield per acre, in some instances over one thousand pounds of marketable product. I found it very saleable at one shilling per pound, while sometimes for cigar manufacture I could easily have got one shilling and sixpence. I have made cigars which were also very saleable.—*Produce World*.

(To be continued.)

FRUIT AND VEGETABLE DRYING.

ONE of the principal reasons that has prevented the expansion of the European fruit and farming industries of the Nilgiris and other districts has been the complete dependence of the growers on the local demand, supplemented by the irregular and capricious requirements in the large towns. For all practical purposes the English orchardist in India has been, and is still, entirely at the mercy of the native dealer. Yet there is no reason whatever that we can discover—and we have devoted a considerable amount of time and trouble to the investigation of the subject—why this deplorable state of things should continue. In India itself there is a proportionately huge demand for all kinds of English fruit and vegetables, both in their fresh and preserved forms. To meet the former demand, certain grave difficulties touching on details of distribution and transit must first be overcome. With these it is not our intention to deal in this paper. We shall confine ourselves to the latter subject, namely, how to meet the demand for dried fruits and vegetables. The process of drying is not at all difficult, and the initial experiments can be carried out at a minimum of expense, a great desideratum in any such new departures. The cheapest and smallest form of dryer is what is known as the Geisenheimer "Herd-dorre" or hearth-dryer, the cost in Germany being only £1-10s., no very ruinous expense. The fruit and vegetables required for experiment can be readily bought in the local bazaars, and as the "Herd-dorre" simply requires bottom heat—obtained by placing it on an iron stove or hot plate—a series of exhaustive experiments might be conducted for not more than one hundred rupees all told. A practical point of some importance lies in the fact that once thoroughly dried, the fruit, etc., may be packed in ordinary wooden boxes, bottles, etc., and will keep perfectly well, though not excluded from the air. The success of the system once demonstrated, larger machines such as the American "Ryder," or the larger Geisenheim pattern (cost £13 in Germany) could be obtained with no great outlay of capital. The "Ryder" may be obtained from Messrs. Mayfarth and Co., Frankfort-on-the-Main, who undertake its manufacture in Germany.

The following extracts from a paper by Dr. Augustus Voelcker, published in the September number of the *Journal of the Royal Agricultural Society of England*, will be

found full of interest and practical information. Voelcker first describes a visit he made to Germany, preparation for the exhibit of fruit-drying at Leices held the same year by the R. A. S. of England:—

As the result of the inquiries which I made, I ascertained there were in particular two machines for fruit and vegetable-drying which had met with the most favour in Germany for use on a small scale, as distinguished from factory use. These were, first, American machine, the "Ryder," manufactured in Germany, stated above, by Messrs. Ph. Mayfarth and Co., of Frankfort-on-Main; and secondly, the "Geisenheim" machine, manufactured by Mr. Valentin Waas, of Geisenheim-on-the-Rhine. The former these has, as previously stated, already been exhibited at the Society's Shows, viz., at Nottingham in 1888, and at Windsor in 1889, on which latter occasion it was awarded the prize in Class (Implements), "Fruit and Vegetable Evaporator suitable for use on a Farm," there being no other competitor in the class. The machine is fully described and figured in the *Journal*, vol. 2nd series, 1889, part 1, pp. 107-8; and part 2, pp. 494-6. It is constructed of wood. The "Geisenheim" evaporator is a machine of later introduction, and is made entirely of iron, having the advantage thereby of not catching fire. It is only intended for use on a small scale, as, e.g., on a farm, while quite small sizes are also suited for domestic use. It is really the outcome of the experience of, and repeated experimental trial by, the instructors at the aforementioned Government "School of Fruit and Vine Culture," established at Geisenheim-on-the-Rhine, in the famous Rheingau, lying near to Rudesheim, and not far from Bingen, which is, however, on the opposite side of the river. So well has the machine answered, that Mr. Valentin Waas, to whom the manufacture is entrusted, has now been able to establish a regular factory for production, and already a considerable number of machines are being yearly turned out. They are manufactured only at Geisenheim Works, and hence by Mr. Waas himself, while the whole sale is practically under the control of the Government School. This machine has of recent years competed most successfully at different exhibitions with the "Ryder" machine, and generally allowed now to possess certain distinct advantages over its rival. On account of this it was selected for use in the Fruit and Vegetable Drying Demonstration held this year at the Society's Show at Leicester.

Mr. Waas makes the machine in several different sizes and in somewhat different form, but the principle is the same in all. There is, first, the small "Herd-Dorre," or "hearth-drier," a machine simply for household use, which can be placed loose upon an ordinary oven (such as is to be found in every German household kitchen range, or hot plate. Its cost in Germany is only from 10s. to 35s. according to size, and it needs no special firing. There are also other kinds, called "Wander-Dorre," either adaptable to any firing arrangements, or having special ones of their own. There are different sizes of this, but all are such as can be employed on a small or moderate scale, and not for factory purposes. I decided to select for demonstration the two varieties above mentioned, viz., the small drier (Herd-Dorre) for household use, and a larger one ("Wander-Dorre No. E," as it is described in Mr. Waas's catalogue), with special firing, for farmers' use.

From the foregoing description (omitted on account of our reference to illustrations and diagrams that we are unable to produce.—Ed.) it will be clear that the Geisenheim machine, I exhibited at Leicester, is an extremely handy one, which may be put with ease anywhere, and which requires no special room for setting it up in, for it may even be used in the open. A couple of wooden bars fitting into rings, one on each side of the oven, and the whole to be lifted by two or more men and placed where required. The whole machine weighs about 4 cwt., its height is nearly 8 feet, and the cost (in Germany), as already stated, 13l. The consumption of coal is about 40 lb. in 10 hours. If fixed in a shed or shed, all that is needed is to carry the smoke outlet pipe to the exterior, and to set the machine on a brick or stone flooring to prevent fire. At Leicester the demonstration was held in a covered-in wooden building. In front were arranged, first, the larger Geisenheim machine, No. E, this being placed merely on a few ordinary bricks resting on the wooden flooring, the joint

PHELPS & CO. have often been asked why they don't open a branch in Darjeeling, but for that matter they have been preparing for years past to open at Bangalore, Coonoor, Madras, Rangoon, Lucknow, Cawnpore, Delhi, Mussorie, and even in Nainital, but they prefer doing business from their Head Establishment, where the Managing Proprietor can have everything under his personal supervision, and travellers are employed to visit everywhere.

SEEDS AND PLANTS OF COMMERCIAL PRODUCTS.

Tea, Assam Hybrid and Indigenous of high class jats, China Tea, Cacao, best Forastero Trinidad varieties, Sterculia Acuminata (Kola nut), true superior variety, Hevea Brasiliensis (Para Rubber), True Maragogipe, Liberian and Arabian Coffee, Nutmeg, Clove, Cinnamon, Cardamom, Vanilla Planifolia (true Mexican variety), Erythroxylon Coca (large and small sized kinds), best Sumatra Tobacco, Mangosteen, Sapodilla, Giant Kew (fruit weigh from 10 to 28 lbs. and over) and twelve fruited Pine Apple, E. Umbrosa, Fourcroya Gigantia, Artocarpus incisa (seedless Bread Fruit), Arnatto, Kapok, Coconut several varieties, Penang Areca nut (large), Landolphia Kirki (African Rubber), Teak and numerous other seeds and plants. Price on application. Boehmeria nivea (Rhea) fresh seed Rs. 5 per ounce (about thirteen hundred seeds may be raised to the ounce, or say 20,000 per lb.) Erythrina lithosperma, new crop of seed Rs. 3 per 1,000 post free, cash with order.

Touching a shipment of Indigenous Tea seed, an experienced Indian Planter writes from Madura District dating 24th June 1896: "Just received the Tea seed; it has arrived in perfect condition, notwithstanding unnecessary delay in transit, and does you credit. Please acknowledge me for five maunds as early next May as possible."

the bricks being filled up with sand, while the smoke flue was led outside the building. The smaller machine, the Herd-dorre, was placed on an ordinary kitchen range, similarly set on bricks, the smoke stack being led through the roof. In both ovens a like ordinary coal was burnt. Placed on a long table on one side were the different machines for cutting, slicing, &c., the fruit and vegetables, and also specimens of the finished products. The rest of the shed was fitted with raised tiers of seats for spectators. Divided off by a wooden partition was a small store-room for the supplies of fresh fruit and vegetables. Two regular demonstrations were given by myself, viz.: at 12 noon and at 4 P.M. The manual work of manipulating the fruit and vegetables, both during demonstrations and in the intervals between them, was done by M. Gernet, who was fully conversant with the working both of the Geisenheim machine and the "Ryder" apparatus.

The method of setting fruit or vegetables to dry is really a simple one, and can be readily acquired. A fire is lighted in the oven, and air passes in at the bottom opening, is heated on its passage, and is distributed by a deflector spreader, causing thus a free circulation of heated air through the trays placed in the upper part of the apparatus. A thermometer marks the temperature reached, and this latter can be modified by the admission of more, or the exclusion of, fresh air through the valve on the spreader. In case of the heat being too great, it may also be lessened by opening the fire-box, or by raising the lever and removing the top of the trays altogether. Ordinary coal can be burnt, so also wood, coke, &c. The sides being double-cased, and the space between being filled with sand, ashes, or some slowly conducting material, very little heat is lost, as can be readily seen by placing the hand anywhere on the outside of the apparatus. The fruit or vegetable, after being cut, sliced, or otherwise prepared, according to their several requirements, are placed on the wire netting of the wooded trays in succession. The fluting of the wire netting allows of a larger drying surface being exposed, and more material can be dried, inasmuch as one piece does not, as a rule, come in contact with its neighbours, and so dries better and more evenly. In this machine are thirteen large trays or frames, and each frame is again provided with a smaller inner tray fitting into the larger one, and enabling almost as much material again to be dealt with. There are two ways of filling the upper part of the apparatus, the one being by putting each tray in successively from below, until the one first put in gradually rises to the top; the other way is by putting in each tray, as filled, at the top of the apparatus, and letting it work its way down until it reaches the bottom. Which way is to be adopted depends upon the kind of fruit or vegetable. Those kinds which, like apples, pears, and other fruit generally, are of a more or less hard nature are placed at the bottom, i.e. where the heat is greatest, the trays ascending successively until the top, or coolest part, is reached, while such materials as stone-fruit, berries, &c., which would, if at once exposed to strong heat, burst the skin and let the juice escape, are placed from the top, and the trays gradually work their way down. In this way the skin is not cracked, but slowly dries up and hardens, retaining the juice within the fruit.

The lifting of the trays for filling from the bottom is effected by pulling over the lever handle. This raises all the trays through the space of one tray, leaving an empty space into which a new tray can be slid. By placing in the notches of the uprights small iron bars already spoken of, across the front and back of the top part of the machine, and then pulling over the lever, any individual tray can be examined at any stage of the process, and removed to either a hotter or a cooler part of the apparatus, according as the contents may require. This is a great convenience when more than one kind of fruit or vegetable is being dried at the same time, as it may be necessary to manipulate one lot in a different way from another as regards the heat to which they should be severally subjected. A special point as regards the drying is that the consumed air of the fire does not come into contact with the fruit, &c., so that the latter is never injured by heat but has only the heated fresh air to pass over it.

In the case of the smaller machine the filling of the trays from the top above or below is effected in a similar way to that of the larger machine, there being a similar lever arrangement. But

there are 9 trays only, and these are flat, and not fluted or duplicated.

Almost every fruit or vegetable must undergo some kind of preparation before placing it on the trays of the machine. These modes of preparation may be either purely mechanical, such as the paring, coring, and slicing of apples, or the slicing of carrots, French beans, &c., or it may be a preparation by steaming, salting, or the like; or, again, there may be the two kinds combined. What is done will depend entirely upon the kind of material. Thus, apples are pared and cored if dried whole, are sliced as well if required in "rings," while pears and almost all vegetables are not merely peeled or sliced, but are steamed as well for a short time preparatory to drying. This steaming may be effected by keeping the material in an ordinary "steamer" on a stove for six or seven minutes, or by using, in case of a large quantity, a special steaming vessel or *Kochkessel* (cooking kettle). In default of steaming, simple immersion in boiling water for a few minutes will do. Vegetables, generally, are also first steeped in water with salt. This steeping is frequently done, too, with apples, and helps to keep their colours, but when it is required to have apples of a very white colour, they are bleached by exposing them to the fumes of burning sulphur for a short time. Cherries and many stone-fruits have only the stalks removed, while with others, as e.g., apricots, the stones are taken out as well.

There were on exhibition at Leicester several very ingenious machines designed to pare and core apples, or to do this and also cut them into "rings." Also others for peeling potatoes, for cutting them into slices, and also into "chips;" others, again, slicing French beans, for slicing carrots, cutting up cabbage, &c. These are mostly of American origin, though now manufactured in Germany as well. Some of these labour-saving machines have been already described in the Journal. Thus, vol. xxv., 2nd series, part 2, 1889, contains (p. 497) an account of an American "paring and coring" machine for apples. It is called the "Eureka," and is made by the Goodell Co., Antrim, New Hampshire, U. S. A. The machines actually used at Leicester were obtained from the Gebrüder Eberstein, Altmarkt 6 and 7, Dresden, Saxony, and comprised an apple and potato parer, costing 11s. 6d., a French bean slicer, 6s., and a combined chopping and slicing machine, suitable for potatoes, carrots, cabbage, &c., which cost 33s. Mr. Val. Waas, Maschinenfabrik, Geisenheim-on-the-Rhine, Germany, also supplies several of these machines, including an apple-parer for 4s., and a very handy combined peeler, corer, and slicer for apples called the "Unicum," and costing 24s. Messrs. Mayfarth & Co., Frankfurt-on-the-Main, Germany, have also very similar machines for sale.

The kinds of fruit and vegetables used at Leicester for the demonstration were necessarily dependent upon what was procurable in the market at the time. The following were employed:—

FRUITS.	VEGETABLES.
Apples (Tasmanian)	French Beans
Apricots (French)	Peas
Cherries	Cabbage
	Cauliflowers
	Carrots
	Onions
	Potatoes (Teneriffe)

Despite the drawbacks incidental to a demonstration carried out on a Show ground, with people continually coming in to see what was going on, and the impossibility of Mr. Gernet being able to give the continued attention necessary to the production of the best specimens, very fair results indeed, it was universally allowed, were obtained, and much of the fruit and vegetables dried in the shed was found, on soaking them again in water (as would be done in actual practice), to have retained to a great extent their original colour, and to have by no means lost their flavour. Moreover, I was careful to keep over specimens of the fruit and vegetables dried on the Show-ground, and have retained them. At the time of writing, these remain perfectly good, and are, on the whole, very good illustrations of what can be done at a moderate expenditure, in saving in a state in which it can be easily kept sound and good, as well as in a portable form, what would otherwise be absolutely wasted.

Next, as regards the forms in which the various fruits and vegetables are prepared: 1

[1 Much detailed information is contained in the following volumes, neither of which, however, has been translated into English: (1) *Traité*,

has been remarked several times that no doubt PHELPS & CO. will raise their prices, now that they have taken their Ladies' Department to 4, Russell Street, but it is a mistake.

pratique du Séchage des Fruits et des Légumes. Par J. Nanot, Directeur de l'Ecole Nationale d'Horticulture, Versailles. L. Tritschler. (2) *Dörbbüchlein für den kleinen Haushalt.* Verfasst von R. Mertens. Wiesbaden: Rud. Bechtold & Co.—Ed. of J. of R. A. S. E.]

I. FRUITS.

Apples.

Apples were dried at Leicester in three forms:—(1) whole, *i.e.* simply peeled and cored; (2) sliced, the whole apple, after peeling and coring, being cut into quarters or slices; and (3) as "apple rings," the peeling, coring, and cutting into rings being all done by a single machine, the "Unicum," already spoken of. The whole apples, slices, or "rings" are put for about five minutes in water to which salt has been added in the proportion of about one ounce to three quarts of water. This supplies the place of "sulphuring," to which objection may be taken, but if one or the other be not done, the apple slices and "rings" will turn a red-brown colour on drying, and will not compare in appearance with the bleached or sulphured "rings" that are imported. The pieces or "rings" are laid on a tray, one piece only just overlapping the other like roofing-tiles. It should be mentioned that, at starting, the whole of the trays are put in the upper framework, the temperature of the oven being, as registered by the thermometer, 180°-210°F. (80°-100° C.); then, when, as with apples, filling takes place from the bottom, a tray is taken from the top, and as it is filled it should be pushed in below the rest, by using the lever. It is left in this position for about ten minutes or a quarter of an hour. Meanwhile, other trays are being filled, and each in succession is pushed in below its predecessor, until the whole frame of thirteen trays is full, and the heating may be then carried on continuously. The time required for drying apples will vary with the kind, the ripeness, and also the form in which they are prepared, "rings" taking, of course, much less time than slices, and whole apples longest of all. The trays should be examined from time to time, the driest fruit being placed higher up, or removed as ready, and the least dry being placed nearer the bottom where the heat is greater.

After all the fruit has been removed as dry, it is well to keep it exposed to the air for six or seven days, after which it may be packed in boxes or bottles; exclusion from the air is by no means necessary. If properly dried it will keep almost indefinitely. At Leicester I had on exhibition apples, pears, plums, strawberries, &c., one year old, and still remaining perfectly good. When required for use again the fruit is soaked in water for six to seven hours and then is ready.

The description of the filling of the trays, and the drying and other processes, has been given at some length here, inasmuch as, with certain modifications necessary in the case of different kinds of fruit and vegetables, it is practically applicable to the drying of them all. The chief modifications are that pears and all vegetables require to be steamed for six or seven minutes after being mechanically prepared, and that, while apples, pears, apricots, and other hard fruits, as well as all vegetables, are filled in from the bottom to the top, stone fruits and soft fruits, like cherries, strawberries, &c., are filled in from the top downwards, for reasons already given. Herbs, when required to be dried, are not steamed beforehand, as they would lose a good deal of their flavor.

The machine No. E. (Wander-Dörre) will hold at one filling, and with the single trays, about 180 lb. of whole apples, which will take about four hours to dry. If the apples be cut, about 125 lb. will go in at a time in the single trays, and take about three hours to dry; while with apple "rings" 90 lb. with the single trays, and 155 lb. with the inner trays as well, can be dried in 1½ to 2 hours. From 100 lb. of fresh apples 10 to 13 lb. of dry produce will be obtained. In the smaller machine (Herd-Dörre) the time of drying is considerably longer, and the quantity that can be dealt with is only about 45 lb. of whole, 25 lb. of sliced, or 15 lb. of "ringed" apples at one filling. Naturally, too, the heating cannot be so well regulated. The expense of firing is, however, no additional item of the cost, being merely that of the oven as required for general domestic purposes; the larger machine No. E., as stated before, burns about 40 lb. of coal in ten hours, and the machine costs (in Germany) £13, the smaller machine costing only about £1 10s.

Pears.

Pears for drying purposes ought not to be quite ripe. They are peeled, and either dried, whole, or, more generally, are divided, and

the seed-vessels cut out, the stems being left on. They then require steaming for eight or ten minutes, and are filled in from the bottom upwards. The temperature used is the same as for apples (180°-210°F.), and the pears will take five to seven hours to dry if divided, or seven to nine hours if whole. The larger machine will take 145 lb. of divided, or 200 lb. of undivided pears, the smaller machine 25 lb. and 50 lb. respectively. From 100 lb. of fresh pears 12 to 16 lb. of dried ones will be obtained.

When preparing the pears before drying, the flavour will be improved if a little sugar be added to the water in which they are cooked, and to this may be put the juice of the removed seed-vessels and peelings.

Apricots.

Apricots are simply cut in two, the stones being taken out, the fruit then dried just like apples, at about 212°F. They will take ten to twelve hours to dry: the larger machine will hold 140 lb., the smaller 35 lb., while from 100 lb. of the fresh fruit 10 to 12 lb. of dried will result.

Cherries.

Cherries should be as ripe as possible before drying. They are generally speaking, not stoned first, but only the stalk is removed. Sometimes it is preferred only to remove the stalks after the cherries have been dried for some little time, so as not to let the juice escape. The trays are filled in from above, as, if put at the bottom in the strong heat of the lower part of the frame, the skin of the fruit would be split, and the juice flow out. A lower temperature than for drying apples is required, *viz.* about 140°F. (60°C.), and from four to six hours is necessary to complete the drying. The larger machine will hold 160 lb. of cherries, the smaller 40 lb., and 100 lb. of fresh cherries will yield 25 to 26 lb. of dry fruit.

Damsons would come under the same heading, as regards treatment, as cherries.

Plums.

Plums should be as ripe as possible. The stems are removed, the plums placed in the trays with that end upwards from which the stem was drawn, so that the juice does not run out. The plums, also cherries, are all the better if they can be put out and dried in the sun for two or three days before placing them in the evaporator. Plums take a very long time to dry, 12 to 16 hours, or even more. The proper temperature is 180°-212°F. The larger machine will take 250 lb., the smaller 45 lb., of plums, and 100 lb. of fresh plums will give 30 lb. of dried.

Strawberries, &c.

Such fruits as strawberries, bilberries, &c., can quite easily be dried, and they retain their flavour satisfactorily. They are filled in from above, just as with cherries. They require drying for four to five hours at not too high a temperature, say not higher than 140°F. for cherries (140°F.).

Raspberries and Gooseberries are fruits that cannot well be dried, for they shrink almost into nothing.

II. VEGETABLES.

As previously noted, these all (herbs alone excepted) require, in addition to the peeling, slicing, or cutting up, to be steamed or cooked for five to seven minutes before they are dried. This is necessary in order to keep their colour and to prevent their becoming hard. When dried on a small scale the cooking in boiling water is generally sufficient. In factories, and where dried on a large scale, regular steaming apparatus is used. Like apples, vegetables are always filled in from below upwards. The temperature for drying vegetables is about 195°F. (90°C.) or rather less.

French Beans.

These are cut into strips by a special machine (already described) and cooked for a few minutes. A little soda added to the water helps to preserve their bright green colour. About 80 or 90 lb. of beans can be put in the larger machine, 12 lb. in the smaller; they will dry in two to four hours, 100 lb. of fresh beans giving 12 lb. of dry.

Peas.

Peas require simply shelling and a few minutes' cooking. They should not be quite ripe, and are laid thinly on the trays, and take two to three hours to dry. The large machine will take 125 lb., the smaller 20 lb., and 100 lb. of green pods will yield 10 to 12 lb. of dried peas.

Ladies in the mofussil do not always realize that they can by corresponding with PHELPS & CO. at their London Branch at Russell Street, keep in touch with all that is newest and most fashionable in the world.

Cabbages.

With cabbages the midrib of the leaf is cut out, and also the ribs when they occur; the cabbages are then cut up, cooked and dried thinly on the trays, and dried as usual for about three hours. At 50 heads of cabbage can be dealt with at a time in the larger machine, 9 in the smaller, and from 100lb. of green stuff about 7lb. of dried cabbage can be got. Red cabbage must be cooked only for a short time, or it will lose its colour.

Cauliflowers.

Cauliflowers are broken up into single pieces or lumps, cooked for five minutes, and dried like cabbage. They often get a brown tinge in drying, but, on cooking again, the white colour reappears. Three to four hours is required for the drying; about 50 heads can be dealt with in the larger, and 10 in the smaller machine. From 100lb. of the fresh cauliflower heads some 4 to 5lb. of dried cauliflower will be obtained.

Carrots.

Carrots are cleaned, scraped, and cut into slices of about one-half inch thickness. After cooking they are spread lightly on trays and dried for three to three and a half hours. The larger machine will hold 75lb., the smaller 15lb., of carrots; 100lb. of the vegetable yield about 8lb. of dried carrots.

Celery.

Celery is cleaned, peeled, and cut into strips one-eighth inch thick. It must be cooked until half soft, and then laid on trays just as apple "rings." The drying takes three to four hours, and from 100lb. of fresh celery about 4½lb. of dry celery can be got. The larger machine will take 50lb., the smaller 9lb.

Onions.

With onions the shell is removed, and they are cut into slices at a quarter inch thick. They take three to four hours to dry. The larger machine can dry 50lb., the smaller 11lb. at a time, and from 100lb. of fresh onions 10 to 12lb. of dried onions may be obtained.

Potatoes.

After washing and peeling, potatoes can be either cut up into thin slices or into strips. When putting them in boiling water before drying it is well to add some salt to the water. They will dry in three to four hours at a temperature of 200°-212°F. (90°-100°C.).

Herbs, &c.

Various herbs, such as Parsley, Mint, Rosemary, Lavender, Wood-sage, &c., can be similarly dried. They must not be put in boiling water before drying. With some, such as parsley, mint, &c., it is a good plan to grind them to a powder after drying.

Mushrooms will dry perfectly well, but *Asparagus* is of too watery texture to deal with successfully by drying.

SELECTION OF FRUIT.

When fruit is intended for sale, care must be taken in the selection of the fruit, alike as regards uniformity of kind, size, ripeness, soundness, and quality. In factories this is a most important matter, much as the price obtained depends so largely upon the uniformity of quality, colour, and appearance generally. This can never be secured if a number of different sorts of apples, for instance, are mixed together, or if fallen fruit is used along with sound fruit. In England and in Germany one and the same variety is not often grown over a considerable area, whereas in America it is. Certain varieties, too, are better adapted for drying than others; and, lastly, by processes employed in a factory much greater uniformity can be obtained than by the use of small machines such as those described in this paper. At one factory which I visited in Germany the apples used for drying were mainly those from trees grown along the high roads, and were sold annually by auction. These were practically of one kind. It is quite a mistake to suppose that, if a factory for fruit-drying were established in a neighbourhood, the factory would be ready to take any and all the surplus fruit that a farmer might happen to have, and which he could not profitably dispose of as fresh fruit. All the arrangements at factories are made well beforehand, by regular contract, and though in the case of a short crop, it may occasionally happen that a factory would be obliged to give a higher price than the farmer could get for his fruit if fresh, this must not be depended upon, and the probability is that when the farmer has a surplus, the factory will not want any of the fruit. So, too, is it with vegetables. Contracts are regularly

made beforehand for the produce of so many acres in this or that crop. In brief, the farmer who wishes in this way to dispose of his surplus by sale must either contract beforehand with a factory, or else exercise great care in selecting his fruit, and in employing the best method of drying it; otherwise he must be content with an inferior price. When, however, the question is one not so much of direct sale in competition with factory and imported produce, but is one of the utilisation of what would otherwise be quite wasted, or where home consumption alone is intended, then this care in selection is not called for, and even fallen fruit may be quite well utilised, for, though it would fetch no price in the market, it would still be perfectly good and useful for home consumption. It is clear, moreover, that in a factory an approach to uniformity in size is a necessity to economy in the working of the various processes of peeling, coring, slicing, &c., whereas on the farm this is not a matter of so much moment.

PACKING AND STORING.

After fruit or vegetables have been dried they ought to be left exposed to the air for six or seven days in a dry, well-ventilated room. If put away in boxes at once after drying, they are apt to become mouldy. They need watching from time to time while in the store-room, and any bad fruit, &c., must be removed, or that which turns mouldy must be further dried in the oven. After this, the produce may be packed in wooden boxes, bottles, &c., and will keep perfectly well, though not excluded from the air.

PREPARATIONS FOR USE.

When required for use, the dried fruit or vegetables merely require soaking in warm water for four to six hours, according to the nature of the material. After the soaking, they are cooked just as one would cook fresh fruit or vegetables. Apples should be cooked in the same water as that in which they are soaked. Vegetables, when required for soups, need no preliminary soaking, but are put in the broth direct, long enough beforehand to ensure their becoming tender.

In Germany a great deal is done in the way of compressing the dried vegetables to a small bulk for army, navy and transport purposes, and not vegetables alone are so used, but also meat of different kinds is compounded with them, and the whole made up into a kind of compressed sausage. It is reckoned that 1½ oz. of dried vegetables will make a good dish for one person.

I found that even in Germany the best Californian "apple rings" competed successfully with the German factory-made produce, and there is still a general idea that American apples, Italian plums, &c., are superior to the home-grown. Nor could I ascertain that, as yet, any of the farm-dried fruit finds its way into the actual markets and shops of the large towns of Germany. But, even there, fruit-drying is quite in its infancy, though there is a firm belief among those best qualified to judge that there is great room for improvement and development, and the introduction of simple and inexpensive machines like the Geisenheim ones will doubtless greatly foster it. In Frankfurt and some other towns co-operative societies (*Genossenschaften*) have lately been started for the collection and sale of fruit, through a system of sorting, and it is intended to take up the question of the disposal of home-dried fruit also. Among the well-to-do classes in Germany the use of "bottled" or "preserved" fruit takes in great measure the place of dried fruit, though the former costs considerably more. There are a great many factories employed in making these bottled fruits. Cider-making, it is well known, is a great industry in Germany, and, where apples are largely grown, what is not sold as fresh fruit is converted into cider. In some parts, indeed, so great is the demand for cider, that, in a year of short crop, apples are brought often from long distances to make up the supply. This militates also against the spread of fruit-drying.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

["HERMIT." Declined with thanks. "WYNAAD RHEA." Your letter mislaid. Write again, please.—ED.]

LIME: SLAKED OR UNSLAKED?

SIR,—I had a conversation the other day with a planter about lime. He advocated the application unslaked. I have

PROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't despair, even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

always applied it slaked. Another planter always buys shell lime from Calicut and slakes it on delivery before application. I have always bought it from Gudalur near Mettupalaiyam, sometimes it arrives slaked and sometimes unslaked, and the seller slakes before delivering.

NILGIRI PLANTER.

SNAKES ON THE HILLS.

SIR,—Will Mr. Daly kindly tell me if the true *Tic polonga* is to be found on the Nilgiris? A friend, a planter, told me recently that he knows of two cases where this snake was seen on these Hills at an elevation, perhaps, of 4,500 feet. In the last case the witness, a syce, stated that as he was leading the horse down the estate road, he was startled by a curious thick snake rolling down the bank, wriggling across the road and then again rolling down the hill below the road. The breadth of the snake was said to be almost as great as its length. Is this the *Tic polonga*?

There is another venomous snake, common at even 5,500 feet, called the *Katty veriun* in Tamil, about 18 inches long, retractile (?) poison fangs, triangular head, barred back (black and brown), whitish pinkish belly. Very sluggish in its habits.

K. V.

STATISTICS: MEANINGLESS SCRUPLES ON.

SIR,—In your issue of the 6th instant, under the heading "The Ceylon name," page 104, you say:—

"... South India is still comparatively unknown at home, and the vastness of its planting industries is minimized by the way in which the various districts are scattered. There is no doubt we want a lot more advertisement than we get, and if we cannot get others to do it for us, we had better take a wrinkle from Ceylon and do it ourselves."

Certainly; and one of the wrinkles to be taken is the rendering of the full statistics of the Districts, called for by the U. P. A. S. I., to be included in its Annual Book of Proceedings. Ceylon planters have done this for something like 40 years. How can we better advertise the vastness of our planting industries? How can we better bring together our Districts which, as you say, are scattered? And yet one, if not two, of our important Districts regards the call for statistics as inquisitorial.

L.

11th February 1897.

[We perfectly agree with you. If planters themselves refuse to help in the work owing to incomprehensible scruples, what can be done?—Ed.]

THE IMPERIAL BUSHEL.

I.

SIR,—Allow me just very briefly to point out to "Imperial Bushel" that the only true and correct bushel measure is that bearing the Government (home) stamp and are known as Government Stamped Imperial Bushel Measures. If these be used by planter and curer alike, there are only two causes to which short deliveries of crop can be attributed to, and they are:

- (1) Pilfering by contractor or bandyman.
- (2) Dryage during transit.

I. G. F.

II.

SIR,—Re the above in your issue of 6th February, the fault of short measure between estate and curers lies more in the way the bushel is "fed" than anything else, I think.

I have lost 20 bushels this year between estate and "works." Curers write to say "bags in good order, not tampered with," etc., etc.

They go on to say "they have not time" to feed the bush quickly but fill "sharp." Let your correspondent try and fill his bushels with a steady flow of coffee from the basket in bushels and then turn it out and "dump" it sharp as they at the curers, and he will find that in 100 bushels he will count out 4 or 5 short.

I certainly think the "curers" should employ more haste to measure when there is a rush of coffee and not hurry through.

ANON.

III.

DEAR SIR,—Your correspondent "Imperial Bushel" is evidently very ignorant regarding his own history—how his existence is at all justified—and that it is H. M. the Queen and Empress of India who has the stamp of respectability and honesty placed on him. I will therefore give him a few facts connected with the Imperial Bushel Measure as made in London, where it must, in accordance with the Weights and Measures Act, be tested and stamped by competent authority before it can be legally used: and it must contain exactly 2,218.192 cubic inches, whatever its form may be.

In connection with the bushel, we have the striker sweeping off the superfluous coffee above the edge of the bushel, which according to the aforesaid Weights and Measures Act is to be of light wood and 2 inches in diameter: this is an important adjunct to the bushel, and can be used fairly and honestly, or the reverse. I have seen bushels struck in a peculiar way and with strange and wonderful strikers, flat "anyhow," and not according to the Act.

I would, however, point out to I. B. that the mere possession of a London tested bushel will not insure accurate measurement of coffee. Contractors well know how (if permitted) to get full measure on the estates and to deliver short measure to the curing yards. Measurement from Hoppers of a standard pattern stops pilfering in that line: but it gives some extra trouble in measuring coffee, and has to a very great extent been given up by growers, which is to be regretted.

To test bushels accurately is a very difficult matter without having special appliances for the purpose: but I. B. may be satisfied the bushels which bear the City of London stamp (if uninjured) absolutely correct. Bushels are by no means indestructible, in fact have short lives, and should be specially cared for: how I. B.'s curers, from using a new Imperial stamped bushel, could have made the parchment to which they refers run short is hard to understand: he has apparently more faith in his contractor than in his stamped bushel and cure. The contractor has no doubt many risks to run, and is to a great extent at the mercy of cartmen and thieves on solitary roads which his carts pass over at night; but at present time they are, all round, and in the hands of experienced, strict but just employers, a most useful and hard-working body of men. I can only advise your correspondent to consult some experienced neighbours *re* how to secure his crop from theft, for he is certainly in the wrong track when he blames the Standard Imperial Bushel for his losses.

[The signature is a copy of the stamp impressed on the Imperial Bushel, and is somewhat as follows:—Ed.]

Crown (very rough pattern)
Imperial V. Q. R. Standard
Double shield
with
cross in centre.

IV.

SIR,—The following notes on this subject may explain some of the points raised by your correspondent "Imperial Bushel" in your impression of the 6th instant:—

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.
MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Richy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Un-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to Common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 6 ft. by 3 ft.

Quotations and further particulars will be furnished by our Mallicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS.

Planters' Library.

Please note that purchasers will effect a saving by sending a M. O. or stamps for the price of the books, plus one anna on the rupee for packing. The value payable commission and registration fees will be saved, while the postage being charged bearing (at the same rates as if prepaid) will ensure safe delivery.

"Englishman," August 1st, 1896

APPRECIATION OF AN INDIAN MIXTURE

Messrs. CHILD & CO.,

The Wholesale Tobacconists of Chowringhee, are in possession of an autograph letter from Mark Twain.

"Indian Daily News," August 1st, 1896

Mark Twain left a substantial memento of his visit here to him in Calcutta in the shape of a letter addressed to Messrs. Child & Co., and an old Mississippi pilot knows what good tobacco is, even when he takes to literature.

MARK TWAIN.

Calcutta, February 8th, 1896

MESSRS. CHILD & CO.

SIRS,—This is the brand I wanted. I have smoked your Honey Dew Mixed in another part of the world, and learned to prefer it.

Truly yours,

S. L. CLEMENS

CHILD & CO.'S HONEY DEW MIXTURE

Is prepared from the four finest growths in the world, viz:—

Sun-dried Virginia (sweet and mellow), Old Kentucky (flavoured), Turkey Dubec (mild), Latakia (fragrant). All fully matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength

WITH DELICIOUS FLAVOUR.

THE FINEST THAT CAN BE MADE. NO EQUAL

In $\frac{1}{4}$ lb. air-tight tins, Rs. 2-8 per lb.

CHILD & CO.,

WHOLESALE AND RETAIL TOBACCONISTS,

MESS AND CLUB CONTRACTORS

2-22, 2-23, CHOWRINGHEE ROAD, CALCUTTA

GENERAL PRICE LIST ON APPLICATION.

"PLANTING OPINION," COONOR.

22nd November 1895.

The Imperial Bushel equals 2218.19 c. in.
 Estate bushel $13\frac{7}{8} \times 15\frac{1}{4}$ deep. 2305.00 „ „
 A box 14 inches square & 12 deep = 2352.00 „ „
 Coffee sent down by Estate bushel generally
 measures out correctly at Coimbatore. It is a zinc cylinder
 weighing about 18 Rupees and is supposed to be the correct
 measure.

We have found this year that 27 bushels of coffee in 5 days
 of drying came down to $24\frac{7}{8}$, a loss of $2\frac{1}{8}$.
 The Badagas this year, I understand, are careful to dry for a
 whole day only so as not to lose in measure, but purchasers
 have been driven to buy only on a guarantee of 100 bushels to
 a ton as the result of this among other reasons.
 When coffee fresh from pulper is examined, all the beans look
 good but there is a large percentage of light empty shells that
 burst after three or four days sunning and the quantity is thus
 reduced. If this bursting is not allowed to take place on the
 estate, it does to a certain extent *en route* with the result that
 the measure is short.

As to differences in size of bushels or rather capacity: the
 Imperial zinc bushel sold by firms must gradually expand from
 time to time and use, the most visible sign being a bulged bottom.
 A Winchester wooden bushel, with iron bands is a more
 reliable machine, but this too is capable of enlargement from use.
 The purchase of a new bushel should not lessen the despatch,
 pointed out by your correspondent, but tend to increase it.
 I will close by stating that it is impossible to measure a
 bushel of coffee twice alike in a dozen times, as I have proven
 in actual trial. One little rap makes a great difference.

RED SPIDER.

THE COFFEE CAMPAIGN.

I.

SIR,—Your correspondent “Cup of Coffee” (*Planting Opinion* of
 6) calls attention to the great importance of pushing the sale
 of Indian coffees and to the decrease of the consumption of
 coffee in Great Britain. Permit me to offer some remarks on both
 these points.

As to the first, I believe that much may be effected by private
 effort, and as one practical illustration is worth a score of
 general assertions, I may give the following. A great many
 years ago circumstances, which I need not enter into, brought me
 in contact with the late head of Messrs. Lyle & Co.’s shop in New
 Street, and I then asked him to go into the market
 and buy the very best coffee he could find, as I was confident he
 would not fail to profit by so doing. Well, fortunately for
 myself, he took my advice, and every time I called at his shop, I
 found that his business was increasing. He got Club after
 Club in London on his books, and long ago his sales doubled, and
 are still steadily increasing, and when I call at the shop I
 am shown a book which records the sales each year. I may also
 mention that, finding the firm was inclined to encourage the sale
 of the best coffee, I recommended people to patronise the shop.
 I looked into the quantity of coffee returned by the roasters,
 and found that 92lb. only were returned per 112lb. of green coffee,
 whereas a larger weight should have been given. This led to
 constraints on the part of the firm, and from the increased
 weight now giving, a saving of upwards of £300 a year has been
 effected. It may be interesting to mention that the present
 manager has received a number of letters, many of them from
 eminent persons like the late Lord Tennyson, complimenting
 the firm on the excellency of the coffee supplied. From my
 experience then, as illustrated by the above-mentioned facts,
 I am sure that planters have the power, if they choose to take

a little personal trouble, of pushing on the sale of good coffee.
 Let me give another illustration.

A friend of mine—a Mysore planter—obtained a medal for his
 coffee at the Chicago Exhibition, and, on my recommendation, sent
 a trial parcel of his coffee direct to New York—part of a lot
 the rest of which was sent to London. The result was that
 the coffee netted £4 10s. a ton more than the lot sent to
 London, and I have reason to think that more would have been
 obtained had it not been for the adhering silver skin, which is
 a distinctive characteristic of Mysore coffee, but which the
 New York people complained of, as the coffee they were
 accustomed to is free from silver skin. Another Mysore
 planter sent some of his coffee to Australia and found that he
 was a gainer from having done so. These illustrations tend to
 show that we do not sufficiently distribute our coffee throughout
 the world. The tendency is to crowd it on to one market, and
 at one time, and hence we do not, I have every reason to
 believe, get nearly as good prices as we might.

As regards our fine Indian coffee, I do not think that much
 good could be derived from teaching people how to make coffee.
 The upper classes who use our coffee soon find out how to make
 the most of it, and if the lower classes did know how to make it,
 the fact would not allure them from cheap tea which, I need
 hardly say, affords a much less expensive beverage. The
 total consumption of coffee has declined in England, but there
 is no reason to suppose that the use of fine grade coffee has
 declined.

Much might be done to push the sale of coffee in India
 through the agency of the Co-operative Society in Bombay, which,
 I found on inquiry, now sells a good deal of coffee which is
 roasted, and ground, and tinned, in England. I have been informed
 on good authority that 75 per cent. of our troops in India
 would prefer coffee to tea if they could buy the former roasted,
 and something might surely be done here by a firm, like that
 of Spencer & Co., of Bangalore, to supply the Commissariat.

The tea planter follows up his produce to the markets of the
 world and pushes its sale. The coffee planters do not, and they
 suffer accordingly.

I may mention that the coffee consigned to New York was
 sent to Messrs. Dadabhoy & Co., Commission Merchants, London,
 Aden, Bombay and New York and Madagascar. I may add
 that, from the facts given in my letter, and other facts which
 have been brought to my notice, it would be of great importance
 to open out a direct trade in coffee to New York as the Americans
 are fond of good coffee, and as we have seen are prepared
 to give good prices for it. I may also add that a very short
 time after the sales of Mysore coffee have taken place in London,
 much of the coffee is resold at higher prices than we obtain for
 it.

B. H. E.

II.

SIR,—I hope the letter of your correspondent “Cup of
 Coffee,” in your issue of the 6th instant, will lead to some
 discussion and awaken Planters to the gravity of the situation
 caused by the decrease of consumption of coffee in Great
 Britain. The question is a most serious one, and undoubtedly
 will lead to a fall in the value of our produce unless some
 energetic action is taken to promote consumption. Planters
 have been so accustomed for several years to good prices that
 they seem to think they will last for ever, but is this likely to
 be the case with the increase of production going on all over

the world with no corresponding increase of consumption? Already has the Brazilian article declined in price fully one-third, and I apprehend it is only the abnormal shortness of crops in S. India this season that has maintained the value of our coffee. With the improved method of curing that is likely to be introduced into Brazil, the wide difference in quality is likely to be reduced, and with a larger yield of coloury kinds from that and other countries at cheaper prices, Indian sorts will be likely to be in less demand.

The causes of the decrease of consumption are several, one being the great activity of the Indian and Ceylon Tea Association who are forcing their cheap teas on the public, and which has probably resulted in turning many coffee drinkers into tea drinkers, (you may be sure that for every extra cup of tea drunk, one less will be drunk of coffee,) and be it remembered it is not simply in England that they are pushing their sales, but that they are now attacking the great coffee drinking countries, notably the United States and Germany, and should they meet with a tithe of their success there, we shall indeed have a severe blow to the coffee interest.

Another cause is the large adulteration of coffee now practised and which is responsible for much of the decrease of pure coffee consumption. Two different factories at Cologne are said to undertake to furnish the machinery for making false coffee bean out of the roasted meal of different cereals worked up with dextrine, each machine being capable of turning out $\frac{1}{2}$ a ton daily at a cost of £1 per cwt. If adulteration could be put a stop to, we should soon see a large increase in consumption, as pure coffee would then occupy the space now filled by the adulterants, and the result would be, with the same consumption, a large increase in pure coffee. Brazil has a great advantage over us in that their currency is on a silver basis, whereas ours is propped up by the short-sighted policy of closing the mints, maintaining the rupee at a fairly artificial value which actually amounts to a tax of about 25 per cent. on our produce. The milreis is the Brazilian equivalent for the rupee, and at their rate of exchange is worth about 9d. A great injustice has been done to all Indian producers by the closing of the mints and giving the honest money of the country an artificial value in the interest of the few. Certainly the hardship on the masses in this time of famine must be great owing to the depreciation in the value of their silver ornaments compared with the rupee.

The coffee planters of South India should in their own interest form an Association to push the sale of coffee in England to start with, and fight against adulteration, and raise a fund for this purpose from an acreage tax. As I understand this question is to be brought forward at the next annual meeting of the U. P. A. S. I., I hope all District Associations will give the subject their earnest consideration.

PUSH THE COFFEE CUP.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma contains per ton:—

61-50	lbs.	Nitrogen.
57-38	"	Potash.
14-92	"	Lime.
13-63	"	Phosphoric acid.

Orders booked for the coming crop of seed from the parent trees of above analysis at Rs. 3 per 1,000.

Manager, ARIENKOW ESTATE,
SHENCOTTAH,
Tinnevely.

COFFEE.

Indigenous seed from Africa.

African Planter. The plant was discovered in the Ch district of British Central Africa by Mr. George Adams. The seed is very tiny, about the size of gram, and it is evident that unless it crops very profusely indeed, it is commercially, valueless. We have distributed the whole of the seed among the Madras Agri-Horticultural Society, Bangalore Lal Bagh, the Nilgiri Government Experiment Gardens at Burliar, the Nilgiri Agri-Horticultural Society and among certain planters in Coonoor, Kotagiri, Gudalur on the Nilgiris, and to Shencottah, Travancore. A dried specimen of the flower and leaf has been sent for identification.

Consumption of coffee in America.

There is no need for the "Coffee Pot Campaign" to extend its work to America, for the consumption of the fragrant berry seems as steadily increasing in this country as it is declining in England, the amount per capita being as much as 9 lb. in America as compared with 1 lb. in England.

Liberian in the Straits.

In Perak the custom is to plant out the Liberian very far apart, only about 400 trees going to the acre. Topping is variously done at 6, 10 and 12 feet. Unmanured yields from large acreages are stated to be excellent, a case being given of some 250 acres in full bearing, 7 to 8 years old, giving $5\frac{1}{2}$ cwts. of clean coffee per acre.

BEES AND THE COFFEE BLOSSOM.

(By our original Correspondent.)

I AM afraid your correspondent H. G. R. in the last issue of the 6th inst., has made a great deal of what he must have seen were only rough notes in reply to some questions. I reply to your correspondent.

If there are cliffs within a reasonable distance of a coffee estate, there is a possibility of the hive of the rock being there. It is a well-known fact that bees go great distances for honey. When the coffee blossom is out, it would continually be visited by these bees. I did not think any of your readers would imagine that I meant the bees would get honey from the rocks, so I repeat that there might be a great scarceness of flowers, still the possibility of there being a place for bees to hive would in all probability bring them there, i.e., to the cliffs. I trust my explanation is satisfactory to H. G. R. With regard to the large numbers of bee hives that were on the tree, it is not possible that the bees were, for some reason unknown to themselves, in the habit of visiting this place years before there was any coffee in the district. One year here there were hundreds of hives of the

on all the trees about; there was not any particular tree plant in flower (such as the *Strobilanthes*). The bees fed for about three months, yet not a single piece of was made. Now what did these bees come for? they, as human beings often do, take a change? The question is an interesting one.

The quotation from Hooker by H. G. R. does not, I think, effectually dispose of my remarks about the fertilization of the coffee blossom; there are other authorities, and one I intend quoting is a more practical one than H. G. R.'s. It is from a work called Cassell's Popular Gardening, and is edited by T. D. Fish, assisted by many artists, curators of public gardens such as Kew, and head gardeners. In this work will be found much information gathered by experiments and from experience. I think the faith is to be placed in this than in a statement which lies generally. You will note that H. G. R.'s para. says "as a rule," and I quite allow that "as a rule" cross fertilization is the most successful, but I do not think that coffee is invariably cross fertilized. I may mention that though I have seen and examined coffee blossom, I am not a coffee planter (or a scientist as you, Mr. Editor, were good enough to "dub" me) and consequently have not had a proper or good opportunity of watching the fertilization of the flower, but I trust that H. G. R. (and may be a 100 ton blossom to watch) will do so and let us have his notes on the subject.

On page 189, Vol. III. of the work above mentioned, is the following information:—

While the general rule is as we have endeavoured to explain it, (*i.e.*, concerning the cross fertilization of flowers), must not be supposed that it is invariable. On the contrary, a flower that is habitually cross fertilized may become close fertilized (*N.B.*—I used the word *self-fertilized*), a flower that is usually protandrous (*i.e.*, the anthers expand first) may become protogynous (stigma ready before its pollen) and *vice versa*, or both stamens and stigma may be ripe at the same moment. Hence there is a possibility in any given flower of much variation in the method of fertilization, and the plan followed in one flower of the same plant is not necessarily the same as that which obtains in another. Such facts as these furnish one explanation of the cause of the variations that we see in plants, whether wild or cultivated, and it is obvious that they require to be very carefully considered by the hybridiser or raiser of seedlings. *If he require to secure a 'pure strain' or a 'pure stock,' he will, or should, study the habits and peculiarities of the flowers, and take every pains to prevent cross-fertilization. If, on the other hand, his desire be to raise new varieties, then guided by the same facts, he will practise cross-fertilization.*"

I think, after reading the above para. carefully, H. G. R. will agree with me that I am right in concluding coffee blossom is close-fertilized. Does coffee not come up very true to seed? How often are there *varieties*? And even with these *varieties*, do they not 99 times out of 100 come true to seed. By variety, I need not say I mean variety in its proper sense, not hybrid.

TEA.

NEW MACHINERY.

THERE scarcely seems a fortnight now without the announcement of some new and ingenious device to smooth the way of the tea-maker and to heighten the excellence of his product. Weather and climate are great factors still in the field, and, until a very short time ago, in the factory also. Now it is otherwise. The variations in moisture and temperature that used to be such a constant source of annoyance to the planter, interfering with his wither, and consequently with his plucking, spoiling his fermentation perhaps altogether, need no longer be seriously considered. Machines are on the market that have been satisfactorily proved to control the wither and fermentation to scientific exactitude. The "Witherer" we are alluding to is manufactured by Messrs. Davidson & Co., of "Sirocco" fame, and the work it claims to do is simply wonderful. As a representative of the firm pointed out in a late interview at our office, the saving in buildings alone will be enormous, owing to the absolute superfluity of the hitherto inevitably huge withering lofts and sheds, with expensive adjuncts of racks, fans and air-tight roofs. For the machine under notice, while capable of withering 3,200 lbs. of green leaf (wet or dry) per day of ten hours, only occupies a floor space of 25 x 20 ft. It is interesting to note the processes by which this result is attained. The leaf to be withered is thrown in a drum, the drum is driven by a small engine affixed to the witherer, which also drives a fan which impels a current of warm moist air through the leaf. The heat is furnished by the waste steam of the engine itself. When the leaf is sufficiently withered, which can be ascertained without stopping the machinery, it is discharged automatically. At this stage the leaf is of a light fermented colour and almost partially rolled, owing to the constant rolling motion it has undergone. It is curious to note that this process, the latest development of modern machinery, is substantially a return to the ancient Chinese practice of tossing and patting the leaf by hand. From the witherer it should go direct to the roller. The machine is thus entirely self-contained; it costs f. o. b. at Birkenhead £275. It will be noted that, apart from the actual savings in withering lofts and racks, that manufacture can be regulated to a nicety, and the rolling commences at stated hours every day.

The new roller Messrs. Davidson & Co. have brought out is in its way as great a novelty as their witherer, the fill being 350lbs. and the power only 2 H.P. The principle adopted is entirely a new one. The box or container is stationary, while the rolling table, which is fitted up with peculiar wedges or ploughs, stirs up the leaf something in the fashion of a churn, hard to describe but easy to understand once the process has been observed. A very light yet well-twisted roll is given, and so thorough is the manipulation, pressure by weights, &c., is entirely obviated. When we consider that the "Little Giant," with its 80 lb. fill, takes the same power to drive it as does Messrs. Davidson & Co.'s with its 350lb. fill, and that the price of

the latter is only £125 f. o. b. Birkenhead, the relative advantages of the machines are manifest.

The next article is the "Oxidiser," which takes charge of the rolled leaf, and by an ingenious arrangement of tatties and fans keeps the temperature down to any desired point. Messrs. Davidson & Co.'s machine is not, however, on the market. A description of Mr. Nathan Sharpe's "Simplex" cool oxidiser will be found highly interesting. This last we take from the *I. P. G.* :—

"It is well known that cool oxydisation gives the best results. At present, oxydisation occupies various periods of time, according to atmospheric and other conditions; it is hoped that the 'Simplex' Cool Oxidiser will facilitate regular time, and, most important of all, a perfect coloring of the leaf.

"The machine consists of a series of racks, upon which the trays filled with the tea leaf are placed, a tank at top of machine is kept full of water, and this water is fed by means of perforated pipes, in small sprays, down the incline boards, on to the (fermenting) cloth ends and sides of the machine, which are thereby automatically saturated, thus forming a saturated cloth chamber, in which the leaf is placed.

"For the effectual cooling of the air and reducing of temperature, two volume fans play on to the saturated cloth curtains at the ends of the machine, and the air thus forced into the leaf chamber is effectually cooled by its displacement and contact with the saturated cloth.

"On the desired colour of the leaf being attained, the water is turned off (by the regulator taps), the fans stopped, and the saturated curtains, at the sides of the machine, pulled on one side. The trays being withdrawn, emptied and recharged, the curtains are again closed up, the water turned on, and the fans started.

"Some idea of the cooling capacity of this Cool Oxidiser can be imagined by the fact that the two 42in. air propellers pass 26,000 to 30,000 cubic feet of air through the machine per minute, and without in any way disturbing the leaf.

"The Large size Cool Oxidiser, of 144 trays, contains 864 square feet of leaf surface, and will take 36 rolls of leaf, approximately, at a charge. £175 complete.

"The Chota Cool Oxidiser, of 96 trays, containing 576 square feet of leaf surface, will take about 24 rolls of leaf, approximately, at a charge. £140 complete.

"The price of the large, size 'Simplex' Cool Oxidiser, complete, is £175, or without trays £135. Packing and delivery f.o.b. London £10. The Chota 'Simplex' Cool Oxidiser, complete, £140, or without trays £116. Packing and delivery f.o.b. London £8.

"Four are already on their way out, and will be erected and worked immediately the new season's work commences."

Lastly, come Davidson's automatic endless web sirocco tea-drier, a full description of which was published in our issue of 19th December 1896. Briefly, it turns out about 320lbs. made tea per hour, and is absolutely automatic in its action. The wet roll is placed on the top web, and the exceedingly high temperature to which it is submitted instantaneously arrests fermentation. The passage of the tea along this web can be regulated in speed. At the end of the web the tea drops on to another web at a lower temperature, and so on until it emerges cool and perfectly dry at the other end.

Competition being an excellent thing, we are glad to see Mr. Nathan Sharpe's name figuring so largely in tea-machinery; in fact, he promises soon to be able to rival Messrs. Davidson & Co.'s present unique position of being able to turn out a complete outfit of machinery from start to finish.

To owners of small factories, who must perforce sigh in vain for the large-size expensive new machines above des-

cribed, we are glad to announce several distinct improvements in the working of those popular and excellent dryers, the old up-draft siroccos. Of packers, sorters, sifters, etc., there are no end, but for detailed description cannot find the space just now.

We cannot conclude without a brief mention of the thing in oil engines, Tangyes' patent, which seems about neat and compact a little machine as anyone could wish. Especially does it seem suitable for small factories, being simple construction and easily managed. We may remember here that though hand-driven rollers turn out work nearly as cheap in factories, reckoning interest on outlay of engine, there is a very great difference in the *quality* of the work which must mean, in the long run, pence per pound.

Big yields.

One thousand and thirty-pounds of made tea per acre on 300 acres, without the aid of any manure, is the yield of Utenwella Estate, Matale West, Ceylon. We shall be disappointed if the Wynaad in a very few years cannot show this figure, excellent though it is. We believe a certain Dooars garden holds the record in the way of big yields, the average per acre being some 1,200lb. odd.

Richmond prices.

Mr. Atzenwiler asks us to correct an error that appeared in our number concerning the price realised by Richmond estate teas in the London market. The average, as given by Messrs. Gow, Wilson and Stanton's circular, reproduced by us, was stated to be 6½d. This is wrong, it should have been a little over 7d. per lb. The mistake, which we regret, is doubtless due to the methods adopted by the above firm of brokers in calculating the chests and packages on uniform weight.

The plague and the Continental trade.

Encouraging this, for direct porters to the Continent! Says *Calcutta I. P. G.* :—

"A firm in this city which has been doing a considerable business in Germany received a letter by the last mail from Berlin requesting that no more tea be sent at present. The samples which were sent had all been fumigated, and had suffered in the process. No tea from India will be admitted into Germany without being fumigated. Fumigation simply means spoliation; in other words, Indian tea trade with Germany is at a standstill. If the plague breaks out in Calcutta, the mere fact of its existence in this city will spell ruin to the tea trade. Are we prepared for this possible contingency?"

The Travancore Tea Plantations Company.

The good effects of the introduction of "company capital" are clearly demonstrated in Ceylon, and we are glad to note in an exchange that the Travancore Tea Plantations Company is being formed to take over the properties in the Peermaad District of Travancore belonging to Messrs. Wm. Mackenzie and H. M. Knight, together with certain lands recently purchased from Government. The properties consist of the Bon Ami and Glen Head estates, the former having 409 acres under tea, and

er some 100 acres. The Directors of the new Company be all the Directors of the Ceylon Tea Plantations Company, Limited, with Mr. Wm. Mackenzie added. The final capital of the Company is to be £150,000 sterling, the present issue will consist of £60,000.

American statistics.

The *American Grocer* gives some very interesting figures on the tea trade in America, showing very clearly the gradual increase in imports, with a stationary or lessening *per capita* consumption, and a steadily declining average *and total* money value. In an interesting interview with Mr. Mackenzie, *Times of Ceylon* correspondent says:—

Turning to figures, Mr. Mackenzie once more referred to the Americans as a coffee-drinking people, consuming 9 lbs. per head against 1 lb. per head in England. There would be a further rise in 1896 in British-grown teas imported, but exact figures could not be given for the year until February. Tea was lumped together by the Customs, and the quantities from the various countries were separately shown. They knew, however, that the total of all teas would be less, and they therefore knew that China and Japan black teas had suffered from the competition. Considering the small portion of black tea consumed in the United States—only 100,000 lbs. against 85,000,000 lbs. of green tea—it would be seen that a large proportion of that portion of the market had been captured by India and Ceylon with their 9,000,000 lbs. imported in the current year.

and advice.

In one of the recent issues of the *Calcutta Planter*, we notice some sound and practical advice given on the management of a garden. It treats on the mixed question of making good crops and making the garden pay. For these two things are by no means identical. A man may make excellent crops, and yet the profit per acre may be a great deal less than that off another garden where the prices are a great deal lower. Suppose a man takes charge of a garden that doesn't pay. Let him first look to the factory and see that everything is all square there before he tackles the cultivation. Let him note what his nearest "paying" neighbours are doing, and compare the differences of methods in the two concerns. Once the make of tea is satisfactory, and building accommodation and machinery up to date, let him turn to the field and make things "hum" there. Above all, let him study the cost of each branch of expenditure, before he launches into any expenditure. It may very well be that he can find he can make tenpenny tea with ease, and that the profit per acre runs out to less than 8d. tea. He should have every detail of cost at his finger's end. If he goes in for coarser plucking, he will probably need more labour and more withering accommodation, that is to say the cost per acre will be increased. Will the extra yield at reduced prices cover this? He may feel inclined to pick the other. Will the higher prices and slightly lower cost per acre make up for the deficiency in crop?

Theory is excellent, but every theory should have a practical application capable of being tested in rupees, annas and pies. A planter should know his estate books by heart. Account keeping has a value second to no other branch of estate-work, provided one thing: common sense to profit by the lessons it teaches.

The London Market.

Although the quantity of Indian tea, says the *Produce Markets Review*, referring to last week's tea sales, January 29th, brought forward has exceeded that of the previous week by about 3,000 packages—Monday's sale alone comprising 39,500, being the largest quantity ever offered in one day—prices show no change of importance. The proportion of the finer descriptions was much larger than for some time past, but, the demand being equal to the increased supply, prices were well supported, and nearly the whole changed hands. Many buyers are, no doubt, securing these grades in advance of their requirements in the anticipation that future imports will not be up to the standard of those now offering, which are certainly better generally than those placed on the market since the early arrivals. The medium kinds, of which there has been a good supply, have also been readily bought at last week's rates, and although prices appear somewhat higher than they were before Christmas, these teas are intrinsically as good value as at any period this season, owing to their better quality and greater strength. As the balance of the season's crop of these kinds is not likely to be in excess of requirements, there is every prospect that current rates will be maintained, especially as they show excellent value compared with the next higher grades, and a good working stock may safely be held. For the lower sorts the market has been somewhat irregular, the poor liquoring teas being difficult to dispose of at former rates, while the more desirable lots were well competed for at steady prices. The recent firmness in the value of all good descriptions of Ceylon teas has been well maintained, and in many cases higher prices have been paid. This has been particularly noticeable in the medium kinds of Pekoe and good-class Pekoe Souchongs, which have advanced $\frac{1}{4}d.$ to $\frac{1}{2}d.$ per lb., while the lower grades also, in many instances, show a rise on previous rates. The upward movement in prices has not been confined to whole leaf descriptions, as broken Pekoes from about 8d. downwards have been in active request, the tone generally being very much firmer. The sales included a somewhat better selection of good teas, although the finest grades are still scarce, and the few parcels offered met with good competition, and realised full rates.

DISTRICT ASSOCIATIONS.

KANAN DEVANS.

A GENERAL MEETING was held at Manalle on 30th January 1897, when there were present:—Messrs. W. Milne, J. W. Schmid, W. D. Martin, R. F. Russell, A. H. Meade, F. J. C. Martin, E. Harley, J. H. Hunter, H. E. Tollemache, F. Armstrong, Baron Joon Rosenberg (President), A. H. Sharp (Honorary Secretary), W. Flemming (by Proxy, Baron von Rosenberg), R. C. Tollemache (Visitor).

Read notice calling the meeting.

Read and confirmed minutes of Annual General Meeting held 9th May 1896.

Resolved that there was no present necessity to build a new dispensary.

Read and confirmed minutes of committee meetings held on July 18th, 1896, and September 4th, 1896.

Read letter from President, District Board, Madura, dated 30th November 1896, giving cover to copy of a letter addressed to the Honorary Secretary, Lower Pulni Planters' Association, stating that there was no chance of a vacancy occurring among the nominated members of the District Board prior to June 1897.

The Honorary Secretary was instructed to reply in suitable terms and to keep in correspondence with the Honorary Secretary of the L. P. P. A. with a view to obtain a seat on the Board as early as possible.

Proposed by the Honorary Secretary and seconded by Mr. H. E. Tollemache that Mr. A. F. Martin be elected a member of Association representing Chittavarai Estate. *Carried.*

Proposed by Mr. Milne and seconded by Mr. Armstrong that Mr. P. Reed be elected a Member representing Pullivasal Estate. *Carried.*

Roads and Communications.—Read letter from the President, District Board, Madura, stating that although the Tanee to Bodinaickanur road would be completed next year, there was no probability of the road being continued to the foot of the Ghaut or of the rivers at Tanee and Periaculam being bridged.

The Honorary Secretary was instructed to continue to press the importance of these roads being completed at once, as at present they are absolutely impassable for days together.

Baron vonRosenberg placed before the meeting the necessity of the better upkeep of the district roads. Proposed by Mr. Milne and seconded by Mr. Tollemache that the Honorary Secretary and another member of the committee ask Mr. Gordon if he would be prepared to undertake the contract for the upkeep of all or any of the roads. *Carried.*

Read correspondence with the Honorary Secretary, Lower Pulni Planters' Association, with reference to the proposed Podanur Railway. *Recorded.*

Baron vonRosenberg moved the following resolution: That this Association is of opinion that more prominence should be given to roads and communications by the U. P. A. S. I. at the next Annual General Meeting.

Meetings.—Proposed by Mr. A. F. Martin and seconded by Mr. F. J. C. Martin that in future General Meetings of the Association shall be held every three months. *Carried.*

Estate Labour.—Resolved that the labour on an Estate belongs to the Estate and not to the Superintendent, and that members' attention be called to Rule VI., and that duplicate discharge certificate be printed.

Labour Rates.—Contract rates having been agreed to, the Honorary Secretary was instructed to have the same printed both in English and the Vernacular.

Low Country Establishment.—Proposed by Baron vonRosenberg that the present system of acreage assessment was not a fair method of securing the requisite fund, and that the storage fee should be raised sufficiently to meet the required amount. This to have effect from the 1st May 1897. *Carried.*

Mettu Bungalow.—Mr. Armstrong undertakes the supervision of the Mettu rest house.

Bodinaickanur.—Resolved that the Association address the Sanitary Commissioner, Madura, with reference to the insanitary condition of Bodinaickanur.

Western Outlet.—Read Mr. Benzie's report on the route from Arnacolum to Cochin. Resolved that now this route has been proved feasible, the Dewan be addressed and asked to immediately appoint an officer to inspect and report on the same and at the same time to allot necessary funds.

General Meeting.—Resolved that the Annual General Meeting be postponed to the last Saturday in May to enable the Honorary Secretary to circulate copies of the accounts before the meeting.

Membership.—Proposed by Mr. Milne and seconded by Baron vonRosenberg that each Estate, the property of the Consolidated Tea and Lands, &c., Ltd., be allowed a vote, the number of votes so

held being limited in number to equal those held by Estates not the property of the above Company. *Carried.*

The meeting closed with a vote of thanks to the chair.

A. H. SHARP,

Honorary Secretary

SHEVAROYS.

PROCEEDINGS of the Monthly Committee Meeting held in the Victoria Rooms, Yercaud, on Monday, 11th January 1897, at 10 A.M. when there were present:—Messrs. C. Sice, C. Rahm (Junior), J. Large, W. W. Hight, F. D. Short, C. G. Lechler, E. H. King-Harman, R. Gompertz, (Chairman), H. W. Leeming (Honorary Secretary).

Notice calling the meeting was taken as read.

Read Letter No. 1031, dated 10th December 1896, from the President, Salem Taluk Board, stating that as the road from Nagalore Chemunathum has no maintenance allotment for its up-keep, it was not possible to hand it over for repairs to Mr. F. D. Short, as requested by this Association, under the A system on other contracts.

Our representative on the Taluk Board, having mentioned that he understood that the Board had no Funds available for this purpose it was resolved "That the matter be postponed for the present."

Read circular, dated 14th December 1896, from the Secretary, U. P. A. S. I., enclosing "opinions regarding Mr. Hockin's claims."

Our Honorary Secretary's letter, dated 21st December 1896, reply thereto, was approved.

Read circular, dated 14th December 1896, from the Secretary, U. P. A. S. I., re Subscriptions to the U. P. A. Reserve Fund.

The Honorary Secretary's reply thereto was approved.

Read and recorded circular, dated 21st December 1896, from the Secretary, U. P. A. S. I., enclosing G. O. on—

"The investigation of the Malarial Parasite."

Read circular, dated 3rd January 1897, from the Secretary, U. P. A. S. I., re Individual Membership to the U. P. A.

Resolved "that this matter be brought before the Quarterly General Meeting to be held this day."

Read and recorded G. O. No. 1905, dated 3rd December 1896, refusing our request that the Deputy Tahsildar at Yercaud should be invested with Civil Powers.

There being no time left for transaction of further business, remaining subjects were postponed for future consideration.

With a vote of thanks to the Chair, the meeting terminated.

R. GOMPERTZ,

Chairman.

H. W. LEEMING,

Honorary Secretary

PROCEEDINGS of the quarterly General Meeting held in the Victoria Rooms, Yercaud, on Monday 11th January 1897, at 1-30 P.M. when there were present:—Messrs. W. Rahm, C. Rahm (Junior), W. J. Lechler, C. Dickins, C. G. Lechler, E. H. King-Harman, W. W. Hight, F. D. Short, J. C. Large, S. M. Pritchard, R. Foul, T. B. Nicholson, R. Gompertz (Chairman), C. Sice, H. W. Leeming (Honorary Secretary).

Notice calling the meeting was taken as read.

Read and confirmed Proceedings of the Committee for the quarter.

The question of "Roads on the Shevaroyes" having been brought forward for discussion, it was resolved

"That a Special General Meeting be called, at 1 P.M., on January 1897, at the Victoria Rooms, Yercaud, to consider the matter."

Read circular, dated 3rd January 1897, from the Secretary, U. P. A. S. I. (which was brought forward from this day's Committee Meeting) re individual membership to the U. P. A.

Resolved "that the matter lie over till a reply is received to the Honorary Secretary's letter of the 5th January 1897."

The Honorary Secretary asked the permission of the Meeting to forward the subjects which were postponed from to-day's Committee Meeting; and, these having been declared "urgent," business was proceeded with.

Read letter No. 2598 General of 1896 from the Superintendent of Police,

in District, enclosing particulars of a case of coffee smuggling woman (Allammal) for which she was fined Rs. 5 by the Salem Sub-Magistrate, this being the first case the Magistrate that a nominal punishment would suffice.

Resolved "that a sum of Rs. 10 be given through the District Superintendent of Police, to each of the two constables from the Police Fund; and that the attention of the Collector be drawn to the utter insufficiency of the punishment awarded in this case."

Read and recorded copy of letter No. 27916, dated 11th December 1896, from the Postmaster-General, Madras, to the Superintendent of Post Office, Coimbatore Division, stating that the Post Office at Bangalore, was made permanent subject to the condition that should there be a loss in any month the Planters interested will be it good."

Read letter from Mr. Acworth, dated 15th December 1896, re the proposed Coffee Association Scheme.

Resolved "that the Hon. Secy. be instructed to write the Secretary, U. P. A. S. I., informing him of the intention of this association to bring forward this subject at the next General Meeting of the P. A."

The following papers were laid on the table:—

November Proceedings of the Coorg Planters' Association.

December Proceedings of the Wynaad Planters' Association.

"Agricultural Ledger," Nos. 8, 21 and 29 of 1896.

"Planting Opinion" for December 5th and 19th, 1896.

With a vote of thanks to the Chair the meeting terminated.

ROB. GOMPertz,
Chairman.

HERBERT W. LEEMING,
Honorary Secretary.

PROCEEDINGS of the Special General Meeting held in the Victoria Rooms, Yercaud, on Monday, January 25th, 1897, at 1 P.M., to consider "the construction and up-keep of all roads on the Shevaroy's planting the Planting Industry." Present:—Mr. F. D. Short, The Rev. Father J. Bruyere, Rev. M. Andersen, Rev. J. M. Kempt, Messrs. C. Rahm (Junr.), T. B. Nicholson, R. Foulkes, R. Gompertz (Chairman), S. M. Pritchard, C. Sice, J. C. Large, C. G. Lechler, W. Hight, E. H. King-Harman, H. W. Leeming (Honorary Secretary).

Proxies:—Mr. F. D. Short for Messrs. T. H. Short, E. W. Short, L. B. Short, C. K. Short, B. N. Short, E. R. Laing, and Mr. E. H. King-Harman for Mrs. Gaitskell.

Notice calling the Meeting was taken as read. The following proposals on the above subject having been brought forward and spoken by Mr. Leeming were, after some discussion, put to the Meeting.

Proposed by Mr. Leeming, seconded by Mr. C. G. Lechler, That a Fund be started called 'The Shevaroy Road Fund' for construction and repair of all public roads and rights-of-way affecting the Planting Industry on these Hills, other than those which are already kept up by Government." Carried unanimously.

Proposed by Mr. Leeming, seconded by Mr. J. C. Large, That Government be asked to grant an allotment to this Fund, each year, of a sum equal to that subscribed by the Planters here." Carried unanimously.

Proposed by Mr. Leeming, seconded by Mr. C. Rahm (Junr.), That Government be asked to allow the control of this Fund to be placed in the hands of the Executive Committee of the Shevaroy Planters' Association. Carried unanimously.

Proposed by Mr. Leeming, seconded by Mr. F. D. Short, That as there is no intention whatever to interfere with any public or private rights, Government be asked, in order to save necessary and prolonged delays, to authorize this Committee to sanction the construction and repairs of these roads whenever applications for this purpose are sent in by Planters concerned." Carried unanimously.

Proposed by Mr. Leeming, seconded by the Rev. M. Andersen,

"That the accounts of this Fund be submitted every half-year for inspection to the President, Salem Taluk Board, or any other official that Government may choose to select. Carried unanimously.

Proposed by Mr. Leeming, seconded by Mr. E. H. King-Harman, "That Government be asked to grant a right-of-way to each estate on these Hills which could, when necessary, be turned into a cart-road, if possible." Carried unanimously.

Proposed by Mr. Leeming, seconded by Mr. T. B. Nicholson, "That Government be asked to state the width that is allotted (1) to Public Roads, (2) to Rights-of-way on the Shevaroy's." Carried unanimously.

The Honorary Secretary was requested to forward the above resolutions to the Chief Secretary to the Madras Government, through the Collector of the District, in the hope that Government will be good enough to meet the wishes of the Association in these matters.

Proposed by the Rev. M. Andersen, seconded by Mr. R. Foulkes, "That Funds for 'The Shevaroy Road Fund' be raised by (1) By voluntary Annual Subscriptions or (2) By a yearly tax of Annas Two per acre on each holding. Carried unanimously.

The Honorary Secretary having informed the Meeting that he would be absent from the Shevaroy's during February, it was resolved—"That the usual Monthly Committee Meeting for February should not be held." At the request of the Honorary Secretary, however, Mr. C. G. Lechler kindly undertook, in the event of any question of importance arising, to call a Meeting for its disposal.

With a vote of thanks to the chair the Meeting terminated.

ROB. GOMPertz, Chairman.

HERBERT W. LEEMING, Honorary Secretary.

WYNAAD.

THE following are the proceedings of the Annual and General Meeting held at the Meppadi Club on the 6th ultimo. There were present Messrs. Abbott, Atzenwiler, DeFonblanque, Hockin, Lamb, D. Mackenzie, W. R. Mackenzie, W. Mackinlay, B. E. Malcolm, J. R. Malcolm, J. S. Malcolm, M. D. Taylor, Trollope, Waddington, R. K. Walker, H. B. Winterbotham and Wright. Mr. B. E. Malcolm, Acting Honorary Secretary. Mr. R. K. Walker, in the Chair.

Annual Report, 1896.

The Acting Honorary Secretary read the following Report:—

MR. CHAIRMAN AND GENTLEMEN,—As your Honorary Secretary has resigned his office, it remains with me, who have been acting for him, to make the Annual Report.

It has been customary for some years past to divide the Annual Report under two heads, one the affairs affecting the planting community in general, and the other local matters, and I have kept to this arrangement.

General Committee of Enquiry.—The most important event of the year has been the appointment by the Government of India of a Committee to enquire into our labour and coffee stealing difficulties. This Committee, after sitting for over six months, has completed its report, and we must hope that it will not be very long before the planting community hears the decision of Government, which we await with considerable anxiety. In the meantime it is a matter of satisfaction to know that the Committee was formed of members who were not only competent to go thoroughly into the subjects before them, but who evinced a sympathetic patience and care in dealing with the evidence on which we may congratulate ourselves, and our thanks are especially due to Mr. Hockin for his share of the work as the planters' representative.

U. P. A. S. I.—The United Planters' Association Meeting was held as usual at Bangalore in August last. It is a matter of regret that the book of proceedings has not, as in previous years, reached us by the end of the year; but the delay has no doubt been caused by the difficulties the Secretary has had in collecting statistics which were to have been included in the book this year. This Association, I regret to say, is one of the principal defaulters in this respect. Owing, however, to the full reports that appeared in the Press, you are fully acquainted with all matters of importance that were discussed at the meeting, and I will only refer again to one or two of them. The financial position of the U. P. A. was, as you are aware, gone into at some length, with the result that the subscriptions of Associations were raised 50 per cent. to cover actual working expen-

diture; and a reserve fund was started to which any one, who so wished, could subscribe. The Resolutions of this Association on this matter are so clear that there is no necessity to discuss it further; but there is one point which will come up again this year, in this connection, that will require your attention, and that is the advisability or otherwise of allowing individual membership of the U. P. A. The U. P. A. was started as, and is still, an Association of Associations, and whether it will be wise to allow individual votes is a question that will require careful consideration.

Import Duties.—Owing to the representations of the Hon'ble Mr. Hodgson, our Member of Council, Government has the matter of Import duties on chemicals used as artificial manures under consideration. By the removal of these duties the prices of some of these valuable fertilizers would be reduced to an extent that would allow of their being taken into general use as manures, and it is needless to point out the immense benefit this would be to planters. Mr. G. L. Yonge, the Secretary of the Association, resigned his office, and did not offer himself for re-election. As Honorary Secretary of this Association for many years he took a great interest in the welfare of the District, and showed a continued interest in planting matters by taking up the Secretaryship of the U. P. A. in its early youth. Our thanks are due to him for his endeavours on our behalf.

Local Roads.—Chundale-Mysore. The correspondence which was carried on last year, and for some time previously, ended in a sufficient sum of money having been granted to complete the metalling and culverts of that portion of the road between Sultan's Battery and the Mysore frontier; and it is gratifying to know that we shall in future have good communication with one of our principal grain-supplying sources. It is, however, a matter for regret that this work has only been done in sections and there are still many portions of the road which are practically impassable during the monsoon. In spite of all representations to the contrary, this road was handed back to the Local Fund Board early in the year. In September last a deputation from this Association went down to Calicut to approach His Excellency the Governor on the matter. His Excellency's reception of the deputation was most kind; and his reply that the matter should be looked into, and that he did not think there would be any difficulty in supplementing the grant for this road, if found necessary, was very satisfactory. It is to be hoped that as the new financial year is approaching, the matter will receive the early attention it merits.

Coffee Robbery.—The excellent Police arrangements made by the Superintendent of Police, Mr. Fawcett, continue to have the same beneficial effect in checking thefts as was the case last year. Up to the present time no representation of any thefts has been made to the Association; and so far as I am aware none have occurred.

Kutcherry at Meppadi.—A most satisfactory arrangement has been instituted by the 2nd Class Magistrate at the request of the Collector under which he holds his Kutcherry at Meppadi on the 2nd Monday and Tuesday of every month. Previously residents in Meppadi and to the South of it had to ride from 10 to 20 miles to attend Kutcherry at Vayitri. This necessitated a considerable loss of time in many ways and is now obviated,—Kutcherry being now held within easy distance of all residents in the Meppadi and Vellera Mulla Districts.

General Remarks.—The number of members on the Association books at the last General Meeting was 39. We have had the misfortune to lose one of our oldest members by the death of Mr. W. C. Dawson of Manantoddy. One member resigned and three new members have joined the Association; the total now on the books is 40. The District has made steady progress in the opening up of tea, and the prices realised have continued to be very satisfactory. No attempt has as yet been made at opening a central factory to which tea could be sent by small holders, although, as has been pointed out by Mr. Standen, it would be a practicable and paying method, and one for which the district offers many facilities. Liberian coffee has been planted to a considerable extent, and crops from this product are beginning to come in. The pulping and curing of this coffee is a matter which is causing considerable anxiety to those who have to do with it, and is one of such importance that all concerned will have to give their attention to it. Arabica coffee, in spite of a worse attack of leaf disease than usual, is doing fairly well. It is to be hoped that the seasons of exceptional drought we have been suffering from for the past two years will not be

repeated, in which case we may hope for better crops next season than we are getting this. A considerable proportion of shortage crops this year is due on many places to the terrific weather we experienced during the past monsoon, a monsoon that has put the record of 1882 quite in the shade. The accounts, gentlemen, are on the table, and I lay my resignation in your hands.

I very much regret that I have not been able to devote as much time to the affairs of the Association as they required; but I had but little to spare.

(Signed) BERNARD MALCOLM,

January 6th, 1897.

Acting Honorary Secretary.

The Report and Accounts were unanimously approved and adopted. *Honorary Secretary.*—The Chairman proposed a cordial vote of thanks to Mr. B. E. Malcolm for his services as Acting Honorary Secretary Delegate to the U. P. A. S. I. Meeting at Bangalore, which was passed unanimously.

At the request of the Meeting Mr. J. W. Hockin resumed his Honorary Secretaryship for a time.

The meeting then resolved itself into the

Ordinary Monthly General Meeting.

Proceedings of last meeting were taken as read.

Import Duties.—Read letters from Messrs. Peirce, Leslie and and Burnett and Sons. Recorded.

Coffee Robbery.—The Honorary Secretary was instructed to address the Inspector-General of Police pointing out the arduous and unwholesome nature of the work of the constables employed in preventing coffee robbery and especially of the constant night-duty, and to request that some corresponding compensation may be given them.

Roads.—Read letter from the Acting Honorary Secretary to the Collector of Malabar dated the 11th ultimo asking what steps have been taken to enquire into the system of keeping up the road Wynaad in accordance with the reply of His Excellency the Governor of Madras to the Deputation from this Association in September last. To this a reply has not yet been received.

The Honorary Secretary was instructed to address the Collector of Government, requesting the appointment of an independent officer to report on the whole system of upkeep of the roads in Malabar-Wynaad and of those connecting the district with the ports on the Coast.

U. P. A. S. I. Circulars.—Read Circular from the Secretary, U. P. A. S. I., regarding Mr. Hockin's expenses and the Acting Honorary Secretary's reply thereto.

The meeting resolved that this Association endorses the suggestion of the Chairman to the effect that a special payment should be made by each District Association to meet these extraordinary expenses in proportion to the votes each Association is entitled to at the meetings of the U. P. A. S. I., and authorises the Honorary Secretary to remit its share of such expenses to the Secretary, U. P. A. S. I.

Read Circular *re* Statistics of Estates.

The Honorary Secretary was directed to inform the Secretary, U. P. A. S. I., that he had endeavoured to collect these, but had only received five returns, of which only one was complete; and that the great majority of planters and mercantile firms in this District decline to fill up the returns, as they regard them as too inquisitorial.

Read Circular *re* "Subscriptions to the Reserve Fund." Recorded.

Read Circular *re* "The Investigation of the Malarial Parasite." Recorded.

Act XIII. of 1829.—Mr. Hockin drew the attention of the meeting to the fact that he had been informed by the Second Class Magistrate of Vayitri that he had received instructions to hold a search enquiry into the truth and nature of every complaint made before him under this Act before granting a warrant, and not as hitherto to grant a warrant on the complainant swearing to the truth of the complaint, and postpone the enquiry until the appearance of the accused. Under these circumstances, it behoved them to be careful that their agreements with maistries, and more especially the maistries' agreements with coolies, contained nothing which was opposed to any High Court Ruling. If the agreements did, the courts would find warrants refused them. It was the ancient custom of the country, and an old custom of maistries and coolies, to draw up agreements so that the advance should be repaid only on the termination of the contract, and work should be performed until there

t of the advance. The former has been ruled "to be a loan to be repaid at the close of the contract," and not an advance on account of work, and as part of the payment for it. (H. C. P. 9 Jan. 1880, 39.) The latter has been also ruled to put the agreement outside of the Act. (H. C. P. 12 Dec. 1871, No. 2181.) A maistry has recently refused a warrant because he deposed that the advance was to be repaid on the settlement of wages at the close of the season. As a matter of fact, it is the custom of the District to hold the balance of coolies' wages each month on the Check Roll as a set off against the advance, and only to pay one or two months' wages when other months' balance remain unpaid. This is a monthly recovery of the advance from wages earned on account of work performed under the contract, but it must be impressed on maistries that they must make their agreements with coolies so as to arrange for this monthly payment, and not for a repayment in one lump sum at the end of the season.

The following are the main points to be attended to in drawing up an agreement that will come under Act XIII. of 1859:—

The advance must be a fresh one on account of work to be performed (a contract only to bring coolies is not under the Act) and as to the wages to be paid for such work. H. C. P. 28 Feb. 1876, 628; H. C. P. 20 July 1877; C. R. C. No. 19 of 1885.

Old balances of advances or debts can be included in this advance without withdrawing the agreement from the operation of Act XIII. R. Bombay XVII. 368; I. L. R. Bombay 9 Bom. 171.

These can, however, be recovered on settlement of accounts, if a coolie does come to work, and if he does not, a warrant can be obtained for the new advance.

Repayment of advances must be by named definite instalments from wages at fixed periods.

I. L. R. 7 Mad. 131, No. 440 of 1883.
" " Bom., No. 501 of 1891.

This fixes the duration of the contract which ends on the expiry of the last period of payment. (M. H. C. No. 354 of 1891.)

Under such an agreement the whole of the balance of the wages to be paid the coolie for maintenance, and thus the difficulty of settling accounts can be avoided.

It is better, however, to name a period in which the work is to be performed as a "Contract to work till repayment of the advance is made within the Act" (H. C. P. 12 Dec. 1871, No. 2181), and it might be possible to enforce fulfilment of contract at the particular time fixed.

If a period is named, allowance should be made for default by stipulating that as many days work as are not performed during the period of contract shall be performed subsequently; or, if the contract is not performed, that it shall be at any time in the next six years that the contractor may be called on to do so by his master. If this is not done, the Court cannot order the execution of the work after the expiry of the period agreed on (M. C. R. C., No. 183 of 1884, No. 179 of 1883, and March 29, 1865). Only payment of the advance can be ordered, though there is no limit of time for such an order (M. C. R. C., No. 448 of 1878).

It would point out that it is especially necessary to impress on maistries that they must make their agreements in accordance with the above rulings if they wish to secure warrants in case of default. Maistries and coolies seem to think the old customs of the country are binding still, and are consequently puzzled and aggrieved when the local Courts follow the High Court rulings.

Mr. Hockin was requested to print his remarks at length for the benefit of the members of the Association.

The Honorary Secretary was also instructed to ask a lawyer to draw up a form of contract that will satisfy all recent High Court rulings on Act XIII. of 1859.

Agenda lists.—In giving notice of future meetings, the Honorary Secretary was requested to send as complete a list of agenda as possible.

Papers on the table, Prize List of Madras Agri-Horticultural Society.

A vote of thanks to the Chair closed the proceedings.

ONE THOUSAND LLAMAS LADEN WITH GOLD.

Who doesn't like to read about buried treasure? Who hasn't dreamed of finding it? What delight suddenly to possess vast riches? Shining

gold, sparkling gems! Things for which we have not been obliged to scheme or toil; that will free us from all need of scheming or toiling thereafter! Ah, let us not indulge such fancies. They make work seem like slavery and wages like pinches of common dust. Yet that such hidden masses of wealth exist there is no doubt. But where are they?

About four centuries ago the Emperor of Peru was a captive in the hands of the Spaniards. His people sent a train of 1,000 llamas (a small beast of burden resembling a camel) laden with gold to ransom him. While on their way, crossing the Andes mountains, the men in charge of the expedition heard of the death of the Emperor, and concealed this enormous treasure so effectually that not a trace of it has ever been found. Go and dig it up, and you will never again feel the sting of poverty.

But clap the brakes down hard on the wheels of your imagination. What was money to Robinson Crusoe? What would the wealth of Peru have been to Mrs. Jane Stranks during a certain period of eighteen months that she tells about? Dust, my dear fellow, countless pinches of common dust. Here is the reason why—one more picture of that fearful furnace in which all earthly desires are melted into one prayer—"Oh, God, deliver me from pain!"

"In June, 1891," she says, "I had an attack of influenza, followed by bronchitis, which left me very low and feeble. I had no appetite, and the little food I forced myself to take gave me pain and palpitation of the heart. I had a weary, sinking feeling at the pit of the stomach and was obliged to fight for my breath. I had a continuous hacking cough, and spat up quantities of thick phlegm. Later on I had *gout all over me*, as it were, my hands, face, and legs being puffed up, and was in agony day and night. I became so weak I could not raise my hand to my mouth, and had to be fed.

"For months I lay perfectly helpless and almost lifeless, having to be lifted in and out of bed. Four doctors attended me for nine months without effect. Then they told me they could do nothing for me, one of them giving me a letter of recommendation to Guy's Hospital. At Easter, 1892, my husband took me in a cab to that hospital, and I was placed in the Miriam Ward, and examined by several doctors.

"At this time a hard substance seemed to have formed in my stomach, which the doctors said was a tumour, and treated me for it. I got weaker and weaker, until one night the nurse told me that the doctors had said I was as bad as I could be, and would not probably live through the night.

"The nurse placed a screen around my bed, expecting me to die.

"Taking a slight turn for the better, I returned home, but was soon as bad as ever. After this I got a letter of recommendation from our landlord, and attended as an outdoor patient at Victoria Park Hospital. After being under treatment a month, I lost all faith in medicine and gave up taking it. I was now *little more than a liking misery*. I was tired of life, and often prayed that the Almighty would take me. I now had fits of shaking so bad that the bed trembled under me. My head was so full of pain that I thought I was going mad, and several times a day I lost consciousness.

"In this dreadful condition I lingered on until November of last year, 1892, when a book was left at our house telling of a medicine called Seigel's Syrup. I had lost all hope of getting well, but my husband would have me try this medicine. To please him I did so; and, after taking it a few days, I felt a little relief. My breathing was easier and my appetite revived. Continuing with the medicine all pain gradually left me, and I gained strength daily. In six weeks I was able to go about the house and do light work, the first time I had done anything in eighteen months. I am now in good health, and able to do any kind of work. I owe my life to Seigel's Syrup, and wish my case to be made known." (Signed) Jane Stranks, 22, Gaywood Road, Hoe Street, Walthamstow, near London, April 29, 1893."

No words of comment can be too strong for a case so remarkable. We stand before it at a loss what to say. It is not a miracle, of course; although many a reputed miracle has been less wonderful. How is it possible that Seigel's Syrup could, with such apparent ease, have restored to health a person in so desperate a strait? Yet that it did restore her is certain. The facts have been thoroughly investigated and established beyond dispute. Mrs. Stranks was on the crumbling edge of the grave, and was thence brought back to the region of health, activity, and enjoyment. How was it done? There is the simple secret. The influenza left her whole system debilitated, as it usually does. Indigestion—which in the first place invited influenza—attacked her with increased power. Asthma, heart disturbance, nervous prostration, the inflamed and congested stomach, which was mistaken for a tumour, etc., etc.—all results and symptoms of arrested digestion—followed. The private and also the hospital treatment failed, because it was directed to the symptoms, not to the cause. Finally, Mother Seigel's Curative Syrup was appealed to, and responded by setting the digestive function in operation, expelling the poison from the blood, and placing Mrs. Stranks at the head of her house, a *saved woman*. But it was a marvel all the same.

As to that pile of treasure hidden in the Andes. We should like to have it. Oh, yes. No use saying we shouldn't. But as between riches and health—give us health. For what would gold have been to Mrs. Stranks the night she lay behind the screen—given up to die? Ask yourself that question.

MARKET SUPPLEMENT.

SATURDAY, FEBRUARY 20, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (January 29, 1897) says:—Supplies at Public Sale have again been light and the market continues firm for nearly all descriptions of the article.

The second arrival of new East India was catalogued yesterday and the competition being very keen, extreme rates were realised.

Good prices were obtained for Columbian and Guatemala, colory kinds showing an advance of 6d. to 1/-.

Futures have been quiet during the week with only a small business passing and quotations have dropped back a further 3d. to 9d.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending January 27th, 1897, says:—Bank rate $3\frac{1}{2}\%$. Bombay Exchange closes at 1s $3\frac{3}{8}$ d. Brazil Exchange $8\frac{1}{2}$ d. Rupee paper $3\frac{1}{2}\%$ 62½. Silver $29\frac{1}{2}$ d per oz.

Coffee continues firm for all kinds, the better qualities being again rather dearer. The very small supply of Plantation Ceylon again realized extreme rates. Brazil markets are quiet.

Daily receipts have averaged 9,428 bags in Rio, and 10,428 bags in Santos.

The Dutch Sale held on the 26th inst. comprised 23,875 bags 185 cases, and was all sold at an irregular advance of $\frac{1}{2}$ to 3 cents, good ordinary selling at 51½ cents against 52 cents in November last.

The market for "Futures" is quiet, and quotations show a decline of 9d to 1s 3d, viz.:—Good average Santos in Havre, March delivery closes at fcs. 62.50, in Hamburg pf. 51½, and No. 7 low ordinary Rio in New York \$9.40.

To-day's London official quotations are:—

	Jan.	March	May	Sept.	Dec.
Rio	49/-	48/-	48/3	48/6	49/-
SANTOS	50/6	50/9	51/3	52/6	52/9

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of January 29th, 1897, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1896-1897...1,143,085 packages.	742,135 packages.	25,211 packages.	
1895-1896...1,097,731 „	648,652 „	36,715 „	
48,076 pkgs. INDIAN	Total 68,726 packages were offered in public auction this week.		
20,311 „ CEYLON			
339 „ JAVA			

During the last few years an increasing business has been done in transshipment of Indian and Ceylon Teas. The total quantities thus sent from Great Britain to all places during the calendar years 1896 and 1895 are shown below.

It will be seen that there is a most encouraging increase in transshipment of both Indian and Ceylon Tea.

	1896.	1895.
Indian Tea	3,146,548	2,330,591
Ceylon Tea	1,482,619	983,712

Nearly the whole of the Indian Tea shown in the above figures was sent to the Continent of North America, while a very large portion of Ceylon went to the same quarter, but Ceylon is also freely exporting to Great Britain for transshipment elsewhere. The following table gives transshipments of Indian Tea and Ceylon Tea, separately, to the United States and to Canada during each of the past three calendar years.

Considerable progress has been made, and this branch of the trade, which is now becoming of considerable importance, appears capable of still greater developments.

Transshipments of Indian and Ceylon Tea to United States and Canada from 1st January to 31st December.

INDIAN.			
	1896.	1895.	1894.
Transshipments U. K. to U. S. A. ...	2,893,234	1,549,501	768,000
Transshipments U. K. to Canada ...	229,990	750,280	127,000
Total lbs. ...	3,123,224	2,299,781	895,000
CEYLON.			
	1896.	1895.	1894.
Transshipments U. K. to U. S. A. ...	929,834	625,324	274,000
Transshipments U. K. to Canada ...	236,092	255,408	98,000
Total lbs. ...	1,165,926	880,732	372,000

Indian. Rather a less quantity was brought forward, viz.: 48,076 packages, against 58,143 last week. The market was firm for all descriptions. The quality from Assam continues very good, and indicates a point to a generally good autumn crop from many of the districts. The following averages may be mentioned:—“Budla Beta,” 1/9; “Hatti,” 1/5½; “Upper Assam T Co. Nudwa,” 1/5; “Eastern Assam T Co. Bali,” 1/4½; “Amalgamated T Co. Dooteriah,” 1/4½.

Week's av. Tea sold on Garden Account, 1897, 34,548 pks., av. 1896, 31,480 pks., av. 9d. 1895, 29,372 pks., av. 10d.

SUPPLEMENT TO PLANTING OPINION.

Comparative prices of Indian Tea in London:—

	1897.	1896.	1895.	1894.
INGS. (Fair ordinary, dark liquor) ...	4½d	4½d	5d	4½d
INGS. (Red to brown, strong rough liquor) ...	4½d	4d	6d	4½d
EN TEA. (Brownish to blackish, strong liquor) ...	6½d	6d	7½d	5½d
SOUG. (Blackish greyish, useful liquor). ...	6½d	6½d	8½d	6½d
E. (Greyish to blackish, some tip, useful liquor) ...	8d	7½d	9½d	8d
SOUG. (Blackish greyish, inferior liquor). ...	5d	5½d	7½d	5½d
E. (Blackish greyish, some tip, inferior liquor) ...	5½d	5½d	8d	6d

ylon. 20,111 packages were brought forward, against 23,165 last Competition throughout the sale was keen, and prices for all es sensibly hardened, an advance frequently taking place, although

this is accounted for probably more by a slight general improvement in quality than any actual rise in the market. The following averages may be mentioned:—"Ormidale," 1/1½; "Campion," & "Henfold," 1/0½. Average for week rather over 8d. against 8½d. for same period last year.

Comparative prices of Ceylon Tea in London:—

	1897.	1896.	1895.	1894.
PEKOE SOUG. (Ordinary leaf; fair liquor) ...	6d	6½d	8½d	6½d
PEKOE (Ordinary leaf, little twist; fair liquor) ...	7½d	7½d	9½d	8d
PEKOE SOUG. (Rather bold leaf; indifferent liquor) ...	5d	5½d	7½d	5½d
PEKOE (Somewhat bold leaf; indifferent liquor) ...	5½d	5½d	8d	6½d

Java. Only 339 packages were brought forward comprising invoices from the "Perbawatte" and "Djattie Nangor" estates; the sale passed with good competition at steady prices.

COCOA.

n advance of 1s to 2s has been paid for Ceylon, and the chief of 1,347 bags by auction found buyers at 54s to 60s for grey dull red; good but rather mixed small, 62s 6d to 65s; small grey, part weathered, 54s 6d; Native, 46s 6d to 54s 6d; 3,582 s West India found buyers, including Grenada at 1s to 1s 6d very, from 41s 6d to 45s, and fine, 45s to 47s 6d. Trinidad went er dearer, also small parcels of other colonial. A fair demand ails by private contract. Fine Ariba quoted 62s to 65s. 480 e foreign description by auction was chiefly bought in. The eries have, since the beginning of the year, been somewhat large.

CINCHONA BARK.

ne opening Dutch auctions of the year were held in Amsterdam erday, and produced the slightly larger supply of 7,137 packages , as compared with 6,984 packages at the preceding sales, and 6 packages in November last.

good demand again prevailed, notwithstanding the large ity offered, and upward of three-fourths found buyers, but the nce of last sale was lost, the average unit obtained being only as against 2½c in December last.

NCHONA.—We hear from Amsterdam, writes the *Chemist and ggist*, that during last Thursday's Java cinchona-auctions, of h we gave the result last week, a cablegram was received from nouncing that there would be a considerable decrease in the rts from the beginning of the year. This announcement, ver, fell flat, as disappointments have been very frequent of The richest parcel of bark offered at the auctions was one of

43 bales of crushed *Ledger*, representing an equivalent of 10·02 per cent. of sulphate of quinine. This lot realised the parity of 4½d. per lb. It was noticeable that fine *Manufacturing* barks realised a higher unit than the average, also that the quantity of bark purchased by manufacturers outside the quinine combination was very large. *Druggist's* barks did not attract much attention excepting for very fine qualities, and, on the whole, this variety was much more neglected than at the preceding auctions, and prices were lower.

BLACK PEPPER.—A continuance of speculative demand has resulted in some further slight advance. The transactions in Singapore amount to 500 or 600 tons. To arrive the latest sales include January-May shipment at 2 27-32d to 2½d. On the spot 2½d to 2 23-32d paid. There were only 80 bags Alleppy in the public sales yesterday, which realised 2½d for greyish.

NUTMEG.—Although the stock here is much reduced, the demand has not improved. The public sales yesterday were too small to report.

MACE is inactive, and no business reported.

CLOVES.—The demand for Zanzibar last reported has subsided, and the market is now rather quiet. 170 bales by auction, part sold at 2½d.

CINNAMON.—The market is firm, and not much offering.

CASSIA LIGNEA is hardening in price with a declining stock now 62,700 boxes, or far below the average of former years. A few thousand boxes have sold at 38s to 38s 6d per cwt.

PIMENTO is steady. 8,700 bags were landed last week, which brought the stock up to 20,000 bags. 588 bags by auction partly found buyers at 2½d to 2½d for the sound, being former rates.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

L. II.]

COONOR, SATURDAY, MARCH 6, 1897.

[No. 5.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Books for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, at Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a more uniform volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 13th March 1897.

KADUR, 3rd March.—*Weather.*—Heat very great lately during the day, but cool and pleasant early morning and evening. Some estates have had a good blossom out, but all of us want rain badly now. *Plant Diseases.*—Leaf disease still showing up on places, while others have got rid of it and are putting on new clothing. Trees have little or no wintering this year. *General Health.*—Fairly good. *Labour.*—Ample, and work is being pushed through as far as possible. This would have been a grand year to have had some advances, as labour was never so easy to obtain.

PEERMAAD, 28th February.—*Weather.*—Rainfall for the month 4·87. *Crops.*—Tea flush improving. *Coffee.*—The late show has had the effect of bringing out a small blossom. *General Health.*—Good. *Labour.*—Sufficient.

South Wynaad. **SULTAN'S BATTERY, 27th February.**—*Weather.*—Changed since last report, afternoons generally cloudy, and we've had several smart showers of rain which has brought out the blossom in several places. *General Health.*—Lots of fever amongst coolies, and the recent rain no doubt will not improve matters. *Labour* will be paid off shortly.

Coorg. **POLLI BETTA, 1st March.**—*Weather.*—From 75 cents to 2 inches of rain fell from the 16th to the 19th ultimo, both inclusive. Though for succeeding two or three days it was cloudy and threatening, it subsequently cleared up and was in every way favourable for the setting of what blossom was brought out. Little or no wind. *Crops.*—Gleaning of the past crop nearly all finished, and nearly all coffee sent away. It is estimated that from an $\frac{1}{8}$ th to $\frac{1}{2}$ of the blossom has been brought out. Great bulk of blossom opened on 29th. *Labour.*—Coolies paid off in many cases. Sufficient left for dry weather requirements. *General Health.*—Fair, some coughs and fever still prevalent.

S. E. Wynaad. **PUNDALUR, 2nd March.**—*Weather.*—On the 16th, 17th, 18th and 19th February we have had very good rains; since that at nights heavy dew is falling, and during the day it is cloudy and at intervals very hot. *Crops.*—The rains brought the spikes forward and the blossom has set. The tea on Richmond Estate is flushing unceasingly. *Plant Diseases.*—Nil. *General Health.*—The fever season is beginning and so slight head-ache and fever is on the coolies. *Labour.*—Ample. *Interesting Items.*—To procure lands about Davala, Nellyalom and Pundalur, I think those who are far off should appoint Mr. H. Atzenwiler to act as their agent as he knows very well almost all the blocks available about the places. And those who want lands about Meiyor Range and Cherambaddy I think Mr. H. Punnett for the former and Mr. P. Guard for the latter may act as agents also.

North Wynaad. **MANANTODDY, 27th February.**—*Weather.*—From date of last report on 18th

LPS & CO., Fashionable Tailors and Costumiers, 16, Old Court House Street, Calcutta. (Ladies' Department: 4, Russell Street.)

ultimo, has been hot for the time of year, and land and sea breezes, (latter particularly), misty mornings and decoy nights have been the rule, parching East winds having been conspicuous by their absence, fortunately for the coffee. Clouds began to bank up for rain towards middle of February, and there was a moderate thunder shower of 81 cents on 14th, since which date weather continued showery until 22nd, giving Manantoddy 1.88, inch but rainfall has been irregularly distributed throughout N. Wynaad. Greatest fall was in the vicinity of Banasúr Mountain, where over 3 inches was gauged, 1.87 inch of which fell on 16th. *Crops*.—Liberian coffee is ripening very early this season, and some was gathered on 17th instant. Coffee blossom was fully out on 24th at and around Manantoddy and Banasúr Mountain, in a somewhat limited radius; beyond that point the blossom was a partial one, the rainfall having been rather deficient, but the backward spike on trees which suffered more severely from leaf-disease was forced forward, and coffee, generally, has had a fine setting-up and has become clothed in shiny new leaves and shoots. *General Health*.—Fairly good; fever in Bamboo district. *Grain*.—Ragi dearer by 5 seers than previously. Rice, unaltered.

Nilgiris.

SHOLUR, 28th February.—Rainfall during month 2 in. 44 cts. Lowest and highest temperature between 6 A.M. and 6 P.M. in shade 40° and 72° respectively. Tea coming on well. Labour very plentiful and health good. Price of ragi same as last week.

COONOOR, 4th March.—*Weather*.—Rain all cleared off on 21st ultimo, total being 5.82, northerly estates getting most. Hot sun and dry March winds are doing their best to dry all up again. *Crops*.—Some low elevation gardens have fair blossom out, but high estates are not so fortunate. With luck and more good rain later on, crops should be good. Tea flushing very well and promises to do still better later on. *Plant-diseases*.—Almost nil. Leaf diseases cleared off for the present altogether. Flushworm in tea insignificant. *General Health*.—Fair. *Labour*.—Plentiful as usual. The old, old fight between cattle and artificials going on briskly with a strong pull in favour of latter. Yearly manuring becoming the vogue, *vice* ancient way of feeding the trees only once in two or even three years. In some places cattle manure is refused, in others as much as 4 as. per bushel is gladly paid. Some hold bratties and leaf-disease are inseparable companions, others pin their faith to it.

GENERAL NOTES AND ARTICLES.

Insurance.

Let shippers and planters remember that by effecting insurance by Sea free of particular average, a saving is made of at least 60%. And free of particular average answers sufficiently well in these days.

To young capitalists.

Says an old North Borneo planter in the *Selangor Journal*:
“Youngsters, fresh out from home, and people who have never learned to plant coffee or to work with coolies, start their own plantations, and very often they lose their money. Let me, therefore, give a warning to those young and inexperienced planters, not to risk their money under any consideration in an estate under their own management. If you are in a hurry and you have the capital, engage an experienced and trustworthy planter to manage your estate for you but keep away from it yourself: don't work on your own estate as an assistant. If you want to learn planting, do so on some other estate, but don't attempt to manage your own before you are sure that other people would not be afraid to entrust you with the management of their estates. If proprietor and manager live together on the same estate, it rarely gives satisfaction.”

PHELPS & CO., Calcutta, have probably the largest and best assorted stock of Woollens in India and will be pleased to send patterns and form of self-measurement.

Teosinte in Ceylon.

In a report on some fodder experiments made in Ceylon, we note that trials were made with teosinte or reana (*Euchlana Luxurians*), “Delft” grass (*Andropogon Schoenanthus*) and different varieties of the cow pea. Teosinte and Delft grass were of course grown only as fodder plants. The yield of the former was at the rate of 15 tons per acre per cutting, or, if five full cuttings could be counted upon in the year, the enormous annual yield of 75 tons per acre. It should be stated, however, that the soil on which the teosinte was grown was a rich black mould. On a poor sand the crop made little growth without manure, and was almost killed out during the dry season.

Sore eyes in cattle.

The following, considered an excellent remedy for sore eyes, appears in the *Cape Agricultural Journal*:

Sulphate of Zinc, *three drachms*, Liquid Extract of Opium, *three ounces*, to be mixed in *twelve ounces* of rain water.

One ounce of the mixture to half a pint of water; of this two ounces to be syringed (a small glass syringe is best) into the eye.

A correspondent writes: I have used the above for two seasons and find it an unfailing remedy. This season out of thirty head treated, only two or three required a second application. If possible, keep the affected beast (with me mostly young cattle) separate from the herd, as it is very contagious.

“THE COLOMBO AGENT.”

(Air, THE V. A.)

The dear Agent.

Should you chance to own a Totum, and be looking round to see Where you may get an Agent who will ship or sell your tea, Of the many clever gentlemen who in Colombo dwell; You'll find one who'll do your business, and do you too as well. He'll pocket all the discounts upon everything he buys, While the highest market prices will be charged for your supplies. And with return commissions and some other little “likes” You'll find he'll leave you standing, and just have you when he likes. Should you wish some cash to borrow, why he'll put the matter right, And express how great his sorrow that the money market's tight. But, when you've signed his mortgages, you'll very soon repent, For he'll raise the usual charges up until they're cent per cent. You may work both night and morning, but no matter how one toils, Like a cruel boa constrictor he will crush you in his coils; For his methods are so wily, and his “kanackes” so abstruse, Though the planter plucks the orange, 'tis the Agent sucks the juice. But if, by great good fortune, you should through your troubles steer; When you've paid off all his mortgages, and once again stand clear; You'll find a pleasant greeting where you had to face a frown, And he'll call your kind attention how he's cut his charges down.

UP-COUNTRY

Caterpillars and Rhea.

A planter who some years ago was intimately concerned with the Rhea experiments in the Wynaad, writes us that with improved and cheaper methods of extracting the fibre now in vogue, he can see no reason why it should not become a great industry in India. Touching on the “caterpillar plague,” this pest was easily stamped out as long as the land was kept in cultivation. All that was really necessary was a certain number of watch coolies, who directly they saw a patch of a yard square, went to the spot and crushed

SHORT ADVERTISEMENTS.

NOTICE.

THE cost to subscribers of short advertisements is One Rupee for every three insertions of five lines or less. To non-subscribers a charge of Two Rupees will be made.

all the tiny caterpillars that had been hatched that day. Perhaps there would be but one such spot in ten acres, and it could be seen 100 yards off. But if left for a few days they would spread over an acre or two, and of course be very difficult to exterminate. Three watch coolies were amply sufficient for 100 acres to keep them entirely in check in their first stage. In any case they never destroyed the roots, only that particular crop of stems attacked, if they were allowed to spread and grow to maturity. Further, the pest was only observed at one time of the year, and never destroyed even one full crop of them.

The Kola nut. Most of our readers are familiar with the name of this product, and we have done our best to arouse a practical interest in its cultivation by distribution of seed and diligently publishing all the information we could collect concerning it. Briefly, it will grow anywhere where Liberian coffee will grow, but the hotter and moister the climate the better. The trees are planted from 10 to 20 feet apart. The returns compare favourably with even the best of coffee land. The chief difficulty hitherto experienced in India was the enormous price demanded for the seed by the few firms from whom it was obtainable. We are glad to announce that the great colonial seedsman, Mr. Thos. Christy, states in reply to a query, that he can deliver a basket of about 100 lbs. f.o.b. London for about £6. As perhaps ten nuts go to the pound, this counting freight, makes the cost per hundred about Rs. 12-8-0 on the estate. Allowing 400 trees per acre, and the liberal margin of 25% for failures in germination, the initial cost in seed runs to about 60 rupees per acre. If half a dozen men clubbed together, it would probably come a great deal cheaper. We have an idea that the kola plants might be first put out tentatively as a species of shade tree among the coffee itself, say at the rate of 100 trees per acre.

Planters and the Queen-Empress. The President of the U. P. A. S. I. has proposed (*vide* circular below) to the members of the Committee that their Association should present an address of loyal congratulation to our Queen-Empress on her long and glorious reign. We trust the Committee will accept it *nem con*, as it would be a slur on the loyalty of the great Planting Industry of Southern India were such an auspicious occasion to pass by unnoticed. Many of our readers, we know, think it all "bunkum," to put it tersely. With these, sentiment is out of place. So we would urge the practical business value of South Indian planters taking part in each and every such public demonstration. One of the immediate ends which far-sighted members of the community have in view, is to impress on all and sundry the fact of its existence, a fact of which very few outside Southern India are aware of. There are not many nowadays who deny the value of advertisement, if a case in point is needed: look at Ceylon. *Verbum sap.*

PEERMAAD, 18th February 1897.

GENTLEMEN.—As the Queen-Empress this year completes the longest, most admirable and most glorious reign on record in our history, and as the occasion is being made not merely a National Holiday but the opportunity for every public body of any importance to testify its loyalty, it has occurred to me that the U. P. A. S. I., the representative of the largest Industry in South India, should not be behindhand.

I propose, therefore,
(1) That an Address in a suitable casket be presented by our Association;
(2) That the Hon'ble Mr. Hodgson and Mr. Ormerod be requested to draw up the address;
(3) That Messrs. P. Orr and Sons be asked to design a casket and furnish estimates for same;
(4) That all expenses be met out of the Reserve Fund.
Trusting that this will meet with your approval, and requesting the favor of an early reply,

I am, Gentlemen,

Yours faithfully,

(Signed) GRANVILLE L. ACWORTH,
Chairman, U. P. A. S. I.

THE FAMINE FUND.

As will be seen from the subscription list published below, the Nilgiri planters have responded in a very ready manner to the appeal made them, and we hope to find a generous circulation between the various districts of South India in furthering this praiseworthy object.

We greatly regret to state however that a by no means inconsiderable minority is strongly averse to contributing to the Fund in any manner whatsoever. The reasons given are two-fold, both of a selfish nature. The first is perhaps the meanest: Why should planters bother themselves at all in the matter, as such abundant funds are pouring in from all over the world? Quite so, let us shirk our duty by all means, if we can get others to do it for us! Our prosperity is bound up in the welfare of this country, and altogether apart from sentiment, it is very short-sighted policy that bids us withhold help from the people and Government of this land when they are in such bitter straits. The other reason is that of short crops and consequent poverty. That these causes should restrict the amount of our individual subscriptions is natural, but that they should stop them altogether is to hold that charity should only be given out of our abundance, and only at such time where the gift is not felt. We venture to define charity in a somewhat different way.

A striking contrast to the above sordid reasons for withholding help to the starving masses of Upper India, is shown by "Bet's" suggestion in our correspondence columns: that the coolies as well as their employers, the planters, should be asked to give their mite.

THEORIES BY A NEW HAND.

DISPOSAL OF PRUNINGS.

AN article that lately appeared in this paper on "Prunings and Disease Germs" contained without doubt much sound advice, but it will be long, I fear, ere the advice given will be acted upon. If we could find a profitable use for prunings as suggested, a great impetus would be undoubtedly given, but, but! Failing that, it has struck me the difficulty could be partially disposed of at least by *deep* burying. Not in the usual shallow trenches of one and a half foot deep or less. No, but in trenches from two and a half to three feet deep. That is to say, to bury the prunings at such a depth that they will never be likely to be disturbed again in the ordinary operations of plantation culture. On an average coffee or tea estate, one such trench every 20 rows would probably suffice, in other words it would be twenty years before the trench would be again opened, ample time I should fancy for the destruction of all vitality in the wretched germs. Besides, there is every likelihood that long before that time, a profitable use would have been discovered for them. Burning them is doubtless more thorough, but the expense is, as it were, all devoted to the single operation of destruction.

This is far from the case in my proposal. Modern planters are generally agreed on the great importance of aerating the soil. They only differ on the methods to attain that result. Some dig renovation pits, which in reality cause more damage than good, as the moisture collects in the pit even after being filled in. And there being no outlet, it stagnates and intensifies the very evil the pits are supposed to combat. Others advocate shallow trenching, which, as far as the top soil is concerned, is undoubtedly excellent. But as the trenches are "broken" every few yards, accumulation of moisture results, also in this case with undesirable results. For it stands to reason a soil in which the moisture can only escape one way, *i.e.*, by evaporation, must always remain sour, no matter what kind of surface cultivation is given.

The deep 2½ to 3 feet trenches I advocate would run at a gentle slope, say one in 30 or 40, across the slope, and carry away all excess of sub-soil moisture. The prunings and handlings thrown in would effect much the same purpose as drain pipes in English agriculture; in fact, when covered in again, would form a series of excellent sub-soil

drains. It has been ably pointed out to the readers of your paper that the great quantity of iron present in the coffee, and also I suppose tea, soils of Southern India render their thorough aeration a matter of great practical moment. Now these deep drains would allow the rains to soak into the land, and to gradually find a passage by percolation through the prunings at the bottom of the trench or drain. Where water has effected a passage—not at the entrance, merely—air follows in its wake, and the process of aeration is accomplished.

The large tap roots or water-roots can, in times of drought, travel down to a great depth, and the more porous the soil, the easier is their work accomplished. The better drained a soil, the more equable its percentage of moisture, and, consequently, temperature. A hard undrained soil is sodden with water in the rains, and baked hard in the hot weather. Both of these conditions are fatal to the successful growth of plants.

I have endeavoured to point out a moral I always try to keep prominently before me: never view any single plantation work solely from its own particular stand-point. Endeavour rather to make it dove-tail into another portion of the work.

WARRANTS UNDER ACT XIII OF 1859.

SOME six or seven weeks ago we published an abstract of a G. O. regarding warrants issued under Act XIII of 1859, which showed that the Government of India had raised a point of very great interest to the planting community. Briefly, the Government of India expressed a doubt whether the provisions of the Code of Criminal Procedure 1892 regarding warrants, apply to warrants issued under Section 1 of Act XIII of 1859, and whether a warrant under that Act can be executed at all outside the jurisdiction of the Court which issues it. Not stopping here, the Supreme Government requested the Madras Government to have proceedings for the issue of such warrants very carefully watched, and to take the earliest opportunity to move the District Magistrate or the Sessions Judge, as the case might be, to call for the record in any case of the kind, and refer the matter to the High Court under Section 438 of the Code, the necessary measures being taken to have the question fully argued before the High Court and the result reported for the information of the Government of India. That is to say, it was virtually ordered that the point raised be referred to the High Court for an authoritative ruling; and certain observations passed by the Government of India showed that the step thus taken was one of very grave import to planters. In the first place, that Government committed itself to an assertion that "though a warrant may issue under Section 1 of Act XIII of 1859, no 'offence' has been committed until the Magistrate has made an order, and that order has been disobeyed. This is a statement that is at least open to challenge. Secondly, the Government of India observed, "on grounds of administrative policy it is clearly inexpedient that the very special procedure provided by that Act" [XIII of 1859] "which applies in certain cases penal provisions to the breach of a civil contract, should be capable of being employed to drag labourers many hundred miles from their homes to answer a charge of such breach, and if it should be decided that the existing law permits of such proceedings, it will be necessary to consider the propriety of amending it."

These remarks have caused the planting community in the Madras Presidency considerable uneasiness. The Hon'ble Mr. Hodgson lost no time in pointing out to his fellow-planters and the Local Government that any ruling in support of the Government of India's view of the matter would practically render Act XIII of 1859 nugatory as regards the protection of planters against breach of contract on the part of maistries, coolies, &c. For months if not years, past the planter has been crying out for more protection in this matter. Yet he is now threatened with deprivation of even the small and unsatisfactory measure of protection hitherto accorded to him. Fortunately, the Government of Madras is more sym-

They have no pretensions to cheapness, nor do they advance any such claims, but PHELPS & CO. understand their business.

ic, and, one or two cases having been referred to the High Court, the Local Government has evinced a desire to give the P. A. S. I. every facility to appear by Counsel in order to argue cases from the planter's point of view. If the High Court persists in this, as it is practically certain to do, no ruling will be given. Arguments on both sides have been duly weighed. But it is important to note that this ruling is not in any case likely to be regarded as final. A decision adverse to the planter cannot be easily submitted to by him, to whom it will mean not simply a refusal to grant what he considers a reasonable request for more protection, but an almost entire withdrawal of the little he now has. On the other hand, if the view of the planter is upheld, steps will doubt be taken to "amend" the law in accordance with the decision thrown out by the Government of India. In either event, therefore, there would seem to be further trouble and discussion ahead. Yet it is well that the point now raised should be fully argued out, and it is to be hoped that the High Court will recognise this. The Government of India itself has expressed a desire "to have the question fully argued before the High Court," and in this at least, the planting community are at one with the Government of India. The result of the reference will be awaited with no little interest. Meanwhile, as the matter is *sub judice*, we refrain from expressing any further opinion on the point at issue.—*Madras Mail*.

SCIENCE AND SOILS.

THE following extracts are from an extremely interesting series of reports issued by the Hawaiian Sugar Planters' Association, referred to in our last issue:

"On Hawaii, it is less necessary to compare upper and lower lands in order to illustrate the action of rainfall upon the lime, potash, and nitrogen contents of the soils; we have an illustration, on a large scale, in the comparison of the soils of the respective districts. In the whole of analyses the nitrogen is found to rise with the increase of rainfall from Kohala to Hilo. In Kau the climatic conditions resemble those of Kohala, and as the nitrogen in the soil is of organic origin, and controlled by the rainfall, the amount in Kau soils corresponds to that in the soils of Kohala. On the other hand, the lime, also the potash, gradually fall as we proceed from the dry to the wetter districts. The lime contents of the Mauna Loa soils, including those of the wet locality of Waiakea and the dry district of Kau, will require special consideration, for reasons of a geological nature already suggested, so soon as more ample data are obtained."

Touching on the physical character of the soil, also largely controlled by rainfall, it is shown that in a dry climate the soils are granular and rough. In a wet climate, the action of rain, humus, and plant roots, result in an abundance of fine soil.

Generally speaking it was found that the power of soils to retain moisture was in direct ratio to the nitrogen they contained. The Hawaii soils, by the way, are extremely rich in nitrogen, being as high as 647 per. cent. in the rainy districts, or say more than equal to unusually excellent cattle-manure! Naturally such an excess of humus resulted in the soils being charged with excess of moisture.

In some interesting remarks on the manner in which ploughing or stirring of the soil should be accomplished, it is laid down as an axiom that the shallower the surface soil, the shallower should be the cultivation. In other words, that though stirring the subsoil is always good, it is a dangerous proceeding to bring it up to the surface, unless the surface soil is exceptionally rich. Wherein lies a great moral to planters. In forking, for instance, in poor soil, never try to turn up sods. Merely *loosen* the soil, do not mix it. The crude subsoil contains plant-food in a state unfit for plant-consumption, and in iron soils often in a state positively dangerous. Trenching poor soils would

thus seem the reverse of wise. This fact is one well known to all modern farmers, but few planters are aware of it. Follow nature. Improve and deepen your soil *from the top*, and not from the bottom. Deep draining is of course quite another matter. The effects on the "nitrifying poochie," of which we have heard so much, is bad.

The nitrifying organisms exist chiefly in the upper or surface soil, and their number falls off with the depth, until at a certain level no more are found. The depth at which these organisms are found, and operate, varies with the nature of soils. In deep, friable and porous soils, which admit water and air freely, and in which plant roots penetrate far and readily, the organisms are found at lower depths. It is otherwise with lands covered with a thin surface soil, and a crude and impervious subsoil; and upon which plant growths root very shallow. It may be found that the color mark, which indicates the depth of vegetable decay, is a gauge of the depth at which the organisms exist and operate; for, as their action is upon the organic matter, their sphere will be limited by the depths to which vegetation descends. If then, thin soils, having a shallow vegetable growth and in which the nitrifying organisms are located near the surface, are suddenly plowed to a great depth, and turned over with a wide, flat furrow, it appears probable that these organisms, and the organic nitrogen that they are to prepare for the use of plants, are turned down to a depth at which the physical conditions are not favourable to nitrifying activity. Two examples have come under our personal notice on these islands; one of them where a thin soil was plowed by steam far below any previous depth, and the other a mauka (dry) soil plowed by oxen, where the subsoil was turned up and laid upon the furrow of surface soil. In the latter case the manager informed us that the land had "laid out of use" for several years; and similar but less durable effects resulted in the former case.

If planters could afford to wait say a year or two after felling and clearing, much of course could be done to improve the soil by deep trenching, as will be seen from the following remarks:—

"Breaking up and stirring soil and exposing all parts of its mass to the atmosphere, enables the oxygen of the air and the great heat of the sun to act upon the organic matter, which, either by direct oxidation, or the provision of conditions conducive to the action of ferment organisms in earth, becomes broken up, whereby the insoluble nitrogen of albuminoids and humus is converted into ammonia and finally into nitric acid, the carbon and hydrogen of the organic matter at the same time uniting with the oxygen to form acids and water. This action is most plainly seen upon decaying leaves lying in exposure to the sun, moisture and the air. The air acts not less potently, though more slowly, upon certain of the mineral bodies in soils. Several of the soil minerals (we have special reason for selecting iron as an example) unite with oxygen in several different proportions, and the proportion of oxygen combined with the iron at any given time depends upon given conditions, which are causing the proportion to vary more or less. The iron, especially in our thin, raw, and badly decomposed soils, is, in large part, combined with a low amount of oxygen; but, because of the great avidity of iron for oxygen, as soon as the low oxygen iron compound is exposed to the air it takes that element to full saturation, and can fix no more. Let this highly oxidized iron however be turned under and hidden from the air, and more especially if the soil becomes covered and filled with vegetation, caused by excess of rainfall, and it will gradually give up a part of its oxygen. Organic matter is a great reducing agent, taking oxygen away from metals. Our method of determining glucose in the sugar house rests on this fact. Glucose sugar is an organic body, and when it comes in contact with the copper in Fehling's solution it takes part of the oxygen away, leaving the metal with a lower amount. We may express the relations of iron and organic matter in the soil in an opposite way, and say that iron is an *oxygen carrier*, taking the element from the air and holding it in the soil, until given up gradually in oxidation of the organic matter. Iron and other bodies are believed to perform the same function in the animal body; taking the free oxygen inhaled and distributing it by the blood circulation throughout the body, where it comes in contact with the organic matter of food and is used in its combustion. The blood leaves the lungs charged with oxygen and returns from the

PHELPS & CO. rely on excellence of workmanship and good taste in building up the biggest Tailoring trade in India.

circuit of the body deprived of the element. In the oxidation of the organic matter in the soil acids are formed, which the iron, robbed of its oxygen, seizes greedily. The low iron oxyd also unites with mineral acids in the soil, such as sulphuric, with which salts are formed actually poisonous to plant life. These facts control our advices in selecting fertilizers for certain lands; we hesitate to use sulphates in certain soils, as in given localities we exclude chlorides. Following then, is a rapid means of conveying oxygen to the soil; and to soil at a greater depth that can be done in plowing for immediate planting, because the raw soil brought to the surface undergoes thorough oxidation during the long period of exposure to the air. As a result, the organic matters are changed into more soluble forms; the low oxygen iron compounds are broken up, and the iron charged with larger amount of oxygen for future use. The practical benefits are a greater depth of soil staple; the soil has been filled with combined and free oxygen and rendered capable of receiving the air more freely; the earth is sweetened and freed from the sourness caused by decay of vegetable matter in the presence of excess of moisture; the elements required by the cane are increased in available form, and by the combined action of the air, sun, and moisture a decomposition of the coarser soil particles is largely obtained. Against these benefits must be placed the danger of loss of plant food, such as nitrogen, by converting the inert soil matters into more soluble forms."

SANSEVIERIA ZEYLANICA.

(BOW-STRING HEMP.)

[Dictionary of Economic Products, Vol. VI., Pt. II., S. 785.]

[REPRINTED FROM THE "AGRICULTURAL LEDGER," 1896, No. 30.]

MURVA FIBRE AS A SECOND OR CATCH CROP FOR TEA PLANTERS.

Result of Examination of a Sample forwarded to the Imperial Institute; Commercial Valuations obtained thereon; together with Review of the Correspondence by THE EDITOR; and a Note on Cultivation by a West Indian Planter. To which is prefixed an Account of the Plant and mode of preparing the Fibre.

Introductory.

The object of the enquiry indicated in the correspondence herein briefly reviewed is to discover a plant that might be profitably grown as a second or catch crop on those portions of Tea Estates not required or not suitable for tea. It is universally admitted that such a crop is much needed. Considerable attention has of late been given to the subject with the result that *Murva* fibre (SANSEVIERIA ZEYLANICA), or as it is known in trade Bow-string Hemp, may possibly come to be so cultivated.

The correspondence under review may be suitably prefaced by the following account of the plant and its fibre taken from *The Dictionary of Economic Products*.

The Bow-string Hemp (SANSEVIERIA ZEYLANICA) plant is a stemless bush with perennial roots, and a rosette of six to eight succulent, radical leaves, the inner of which are often four feet long, and end in a long straight spine, the scape or peduncle, one to two feet long, rising from the centre of the leaves. Flowers racemose, greenish-white, erect, four to six together in clusters. It is found on the eastern coast of India from Bengal to Madras; common on the

Habitat.

Coromandel coast, in Cumbum, and in the Dindigul district. It is stated that in Malabar of which country it is a native, it does not produce seed. In India it may be said to exist under cultivation mainly. It is distributed to Ceylon, Java, and the coasts of China and Africa.

Fibre.

From the succulent leaves is extracted a fibre held in high esteem by the natives on account of its elasticity and consequent suitability for bow-strings. The fibre is used for the preparation of cordage and matting in the regions where it occurs, and is much valued in Europe for ropes used in deep sea dredgings.

The fibre is pliant, soft, and silky, and much resembles that of the pine-apple. It is usually prepared by taking the fresh leaves and placing one of them on a smooth board which is raised at one end.

Mode of preparing the fibre.

The lower end of the leaf is then pressed down by the toe of the workman, who squats on the plank, and with a blunt knife or piece of iron plate scrapes upwards along the surface of the leaf and thus deprives it of its fleshy pulp by successive scrapings, turning the leaf over

and over, as may be necessary. When the pulp is thoroughly removed, the fibre is washed for three or four minutes, and dried in the shade. Washing in brackish or salt water, or continuous soaking in water, is said to destroy the glossy white appearance of the fibre. With reference to the strength of *Murva* fibre DR. ROYLE made some comparative experiments with this and AGAVE fibre, which showed that the two were about equal in strength. . . . The thread made from *Murva* fibre is sometimes woven into fine cloths which readily take on various dyes.

On the 20th December 1895 (letter No. 1880), the Reporter of Economic Products forwarded to MR. ROYLE, Curator, Indian Section, Imperial Institute, a small quantity of Bow-string Hemp or *Murva* (SANSEVIERIA ZEYLANICA) fibre. This had been received from

HONOURABLE J. BUCKINGHAM, C.I.E., of Amguri, Assam, through his Calcutta Agents, MESSRS. BEGG, DUNLOP & Co. The covering letter to MR. ROYLE stated that tea planters were anxious to have an auxiliary crop, and asked that a valuation of the sample might be obtained at an early date. The letter concluded by saying that if the report proved encouraging, endeavours would be made to procure a larger parcel so as to allow of a practical test. Also that any suggestions as to methods of separation of the

Imperial Institute. fibre, defects of present sample, etc., would be highly appreciated. About the same time the Reporter in a letter to MR. H. C. BEGG of MESSRS. BEGG, DUNLOP & Co., wrote:—I saw the plant growing while I was in Assam. Nothing could be simpler than the system of cultivation and method of separation of the fibre. If the price offered for it should leave a reasonable profit over and above expenses involved, I am disposed to regard this as by far the most promising auxiliary crop which the Assam planters could find. If the HONOURABLE MR. BUCKINGHAM could send me a much larger sample, it would be possible to obtain a definite valuation.

Reply was duly received from MR. ROYLE who forwarded the appended reports kindly obtained by him on the sample referred to:—

From J. H. CHRISTIE, Esq., to J. R. ROYLE, Esq., C.I.E., Curator, Indian Section, Imperial Institute,—dated 72, Mark Lane, London, E. C., 27th February 1896.

Yours of 24th and sample of SANSEVIERIA to hand. We value £16-17 per ton; but had colour been bright white instead of yellow, we should have put same £20 per ton. This fibre will sell easily; we shall be glad to see a trial shipment of 20 or 30 tons. The cleaning is perfect and cannot be improved.

From C. E. COLLYER, Esq., to J. R. ROYLE, Esq., C.I.E., Curator, Indian Section, Imperial Institute,—dated 155, Fenchurch Street, E. C., 23rd January 1896.

I have examined the sample of fibre described as "Bow-string Hemp," SANSEVIERIA ZEYLANICA. This specimen is inferior to the fibre obtained from the usual growths of SANSEVIERIA ZEYLANICA. It is less fine, more variable in strength, partly weak and brittle and of poor colour—these defects may possibly be owing to the fibre being overripe or from old stems—as it is too much like some of the Aloe fibres to realise its intrinsic value, and in the condition of this specimen it would not in the present low markets realise more than about £20 per ton in London, but when more carefully prepared and of the usual good strength and colour the value would probably be £25 per ton and upwards. A few tons carefully prepared should be sent to test the market.

From C. E. COLLYER, Esq., to J. R. ROYLE, Esq., C.I.E., Curator Indian Section, Imperial Institute,—dated 155, Fenchurch Street, E. C., 24th January 1896.

In continuance of my Report on the SANSEVIERIA ZEYLANICA fibre, and in reply to your questions of the 21st instant. The quality of the fibre would be much improved by the use of suitable decorticating machines, and so far as any fibre has come to market the best results have been from the improved "W. E. Death" machine which turns out about 6 cwt. per day of cleaned fibre at a cost at least as small as by any other system. Soil and climate have much to do with the quality of the fibre and also to have the right variety for fibre purposes of the SANSEVIERIA ZEYLANICA. The fibre may be packed in bales of about 3 cwt. each, moderately pressed; each head (or small bundle) tied round near the butt end with some of the fibre—the fibre must not be knotted or plaited but packed straight, to preserve the fibre from being discoloured; the fibre to be perfectly dry before packing.

If their representative has not been in your station recently, PHELPS & CO. will be happy to send him—anywhere, from Quetta to Mandalay.

THE MADRAS EQUITABLE ASSURANCE SOCIETY.

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George.

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ... Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.,)
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} for payment of death claims.

On Policies transferred to the London Register, death claims will be paid in England at the current exchange ^{or} on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Drafts on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years

Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to only Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesday and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

from MESSRS. SLANN & DAVIS, to J. R. ROYLE, Esq., C.I.E., Curator, Indian Section, Imperial Institute,—dated 51 and 52, Fenchurch Street, E. C., 29th January 1896.

In reply to yours of 24th instant (which we regret we have not replied to before) we have examined the sample of fibre you sent us and find this very similar to Aloe fibre, fair colour, good strength. We should value some at about £18 per ton up, we might even get as much as £20, but this is very uncertain in the present state of the market. Prices are at present lower than they have been for many years, but there is every prospect of an improvement before long, as the low prices have stopped the production of certain hemp (New Zealand, etc.) and Manila is very firm now with every prospect of higher prices. Of course it is very difficult to give an exact valuation on the small sample sent us; we would recommend you to let your friends to ship, say, 10 bales when we should be pleased to give the fibre a fair trial.

The HONOURABLE J. BUCKINGHAM, C.I.E., through MESSRS. BEGG, DUNLOP & Co., informed the Reporter that he regretted he would not just yet be able to furnish a larger quantity, but that he was extending the cultivation of the fibre as quickly as possible. Mr. ROYLE was accordingly informed (letter No. 1227—76, dated 29th April 1896,) that some delay might be expected before a large supply of the fibre could be produced. Copies of the correspondence and of the foregoing reports were then handed to MESSRS. BEGG, DUNLOP & Co. by the Reporter with a letter No. 951—76, dated the 2nd April 1896. In that letter the Reporter mentioned that a few tons of the fibre were required as an experimental consignment to test the market, and also for complete investigation by the Research Department of the Imperial Institute. The Reporter accordingly requested to be informed whether MESSRS. BEGG, DUNLOP & Co. would be prepared to entertain the idea, and added:—"It would seem desirable that you should go the length of purchasing a machine suitable for cleaning the fibre, and one of our correspondents, it will be observed, has suggested the one that is considered most suitable." The Reporter further stated that the purchase of a decorticating machine suggested.

That he had recently been urging to the attention of planters the claims of Rhea fibre for that purpose. There could be no doubt that there was room for both fibres, and that some districts might find the Bow-string Hemp more convenient and equally profitable to Rhea. These were fibres that would meet independent demands and could never enter into competition. It had been suggested that SANSEVIERIA ROXBURGHIANA might be found a better species than S. ZEYLANICA. Before direct steps were taken to lay out a plantation, experiments might be made on a small scale side by side with authentically named rooted plants of both forms. Very possibly these could be supplied by the Superintendent, Botanic Garden, Sibpur.

The HONOURABLE J. BUCKINGHAM, C.I.E., wrote under date 28th April 1886, through MESSRS. BEGG, DUNLOP & Co.: "It is very satisfactory to find the fibre so well spoken of, but it is quite impossible for me as yet to get any large quantity of it. It appears to me that the best thing I can do is to extend the cultivation of this fibre at first to about 5 acres, and then see what that area is capable of producing. I have enough at present (starting from a single plant only) to put out about one acre, and all the available shoots I am now cutting up and planting out."

The following Report on the sample in question was kindly furnished by SIR FREDERICK ABEL, BART., K.C.B., with Flying Seal letter No. 92, dated 11th June 1896. This Report gives the comparative results of examination of the fibre obtained in the Research Department of the Imperial Institute.

REPORT ON SANSEVIERIA ZEYLANICA FIBRE.

The fibre of this plant, which belongs to the natural order LILIACEAE is of a beautiful light colour and fine gloss. The staple is about four feet in length, of smooth well-formed threads.

It is so well-known now that Messrs. PHELPS & CO.'s prices, notwithstanding that they are considered high, are so much below those of London, that their trade is advancing by leaps and bounds.

Report of the Research Department.

The sample was obtained from Amguri in Assam, where Dr. George Watt, C.I.E., Reporter on Economic Products, observed that it was being grown upon waste land by a tea planter. Dr. Watt states that the plant can be grown without cultivation; if fragments of the leaves are scattered over the soil, each fragment takes root rapidly, and a good crop is yielded in a very short time.

Chemical examination shows this fibre to be of high quality. Mr. Cross (a member of the Committee of Advice) examined a sample of Sansevieria which was included in the collection at the Indian and Colonial Exhibition, and also tested its paper-making qualities; the chemical results obtained by him showed that the specimen he examined was inferior in quality to the present sample. (Report on Indian Fibres, 1886.)

The following are the results furnished by the two samples:—

SANSEVIERIA ZEYLANICA	Assam.		From Colonial and Indian Exhibition.*
	Assam.	From Colonial and Indian Exhibition.*	
Moisture%	9.4	9.7	
Ash%	0.7	0.7	
Loss by A. hydrolysis%	11.8	12.5	
Loss by B. hydrolysis%	14.9	16.5	
Loss by mercerising%	11.6		
Loss by acid purification%	1.4	2.5	
Gain by nitration%	33.5	6.0	
Cellulose%	75.6	64.6	
Length of ultimate fibre in mms.	1.5—3.5	1.5—2.5	

With the exception of the results of chemical examination obtained in the Scientific Department of the Imperial Institute, there are very few available for purposes of general comparison of monocotyledonous fibres. Reports on twenty-one different species have from time to time been published in the Institute Journal. Many of the fibres dealt with in these reports were obtained, it is true, from plants which were not indigenous to the locality they were grown in. Special care, however, had been taken in the cultivation and treatment, so that the fibre which they furnished was probably little inferior to the same kind of fibre derived from the wild plants grown in their natural habitat. Accepting the results which they furnished as suitable for purposes of general comparison, it appears that the "cellulose" numbers furnished by fibres of monocotyledonous origin range from about 61 to 77, the average number being about 70. The "nitration" numbers range from 9 to 34, with an average about 20.

Cellulose.

Nitration.

Sansevieria, which furnishes the numbers 75 and 33, respectively, therefore ranks high among these fibres. Again, the A. and B. "hydrolysis" numbers, and especially the difference between them, are of special significance. The Victorian monocotyledonous fibres may indeed be classified from this point of view (see Victoria-grown fibres, Imperial Institute Journal). Thus, the approximate A. and B. hydrolysis numbers and differences are, respectively, for the Cordylines:—15, 19 and 4 for the Agaves:—16, 21 and 5 for the Kniphofias:—17½, 23 and 6.

Hydrolysis.

Victoria-grown fibres compared.

These would indicate that it should possess special powers of resistance to weathering and the accompanying hydrolytic effects. The general results of chemical examination of this fibre may be considered as very satisfactory. A comparative statement of the results furnished by the monocotyledonous fibres, showing the relation of Sansevieria thereto, is appended:—

	A.		B.	Difference.		Cellulose.	Nitration.
	No.	No.		No.	No.		
Cordylines	15	19	4	68½	18		
Agaves	16	21	5	75½	19		
Kniphofias	17½	23	6	71	29		
General range	10—18	20—30	10	61—77	9—34		
Sansevieria zeylanica	12	15	3	75½	33		

The reports of experts on this sample of Sansevieria were favourable, although it exhibited some trifling defects due, probably, to the degree of maturity of the plant from which it was prepared. A supply of several tons has been asked for, with a view to submit it to practical trials.

* (Report on Indian Fibres.)

NOTE ON THE CULTIVATION OF *SANSEVIERIA ZEYLANICA*, BY A WEST INDIAN PLANTER.*

Cultivation of murva fibre.

The plant grows best in a moderate shade in black soil, the cultivation is *easy* from either cuttings from stems or from roots, the plants should be about 18 inches apart and 18 inches between the rows, the soil should be moist but not too wet, and the growth is much more rapid under shade than in the hot sun and the quality of the fibre is better. The plants are usually ready for cutting in from 9-12 months and may be cut at any season, *except after a long drought*, when the fibre is apt to be harsh and tender. The plants attain nearly double the height in black soil and shade compared with the red soil in the sun, and the fibre of the freely growing plant is naturally much superior.

THE NUTRITIVE PROCESS IN PLANTS.

(PROF. J. REYNOLDS GREEN, D.Sc., F.R.S.)

No IV.

(Continued.)

CARBOHYDRATE reserve materials are not always deposited in the shape of starch grains. The roots of our biennial plants furnish us with examples of another kind of store. If we examine the root of a beet or a mangel wurzel we find that the succulent substance is distinctly sweet to the taste. This sweetness is due to the presence of a solution of cane sugar in the sap. The cells are very turgid with water, and this contains a large percentage of cane sugar. Indeed, the manufacture of sugar for the market from beet-root is, as is well-known, of great commercial importance. The sugar here remains in solution, and is not deposited as starch as in the former case. We cannot however, think of it as remaining unchanged after its transit from the leaves. The process of its formation is much like that of the potato at first. But when the leaf starch has been converted into sugar, that sugar is malt sugar as before, and it is transformed into cane sugar after its arrival in the root.

An onion affords us an instance of yet another kind of carbohydrate deposit. Here the fleshy leaves of the bulb, wrapping it so closely round as to form a very solid body, are charged with an accumulation of grape sugar, a third kind, differing from both malt sugar and cane sugar, such as we have seen to occur during the processes already described.

The chief form of deposit in seeds is that of starch, which is the most stable body and the least liable to disturbance. This no doubt is why it is adopted by the plant for this reservoir, as generally a longer time, indeed in some cases a very prolonged period, passes before it is called upon to supply nourishment to the young plants. Carbohydrate material is thus stored in many forms and in various places in the plant. Similarly, nitrogenous material or proteid has its appropriate reservoirs. We have in many seeds, particularly leguminous ones, stores of this material in the form of definite granular aggregations, which botanists have called *aleurone grains*. If we take for instance the pea or bean, we see that the cells contain embedded in their protoplasm structural elements of two sizes. The larger shows the curious concentric marking peculiar to starch, the smaller show no structure. Instead of turning blue when treated with iodine, they become brown or brownish-yellow. These small grains are the aleurone grains, and are made of proteid. This substance is not all uniform in its properties, indeed, we are familiar with many kinds of proteids, which differ very considerably with regard to the fluids in which they will dissolve. Those proteids which most readily occur to our memory are the albumin or white of egg, the globulin of muscle,

the fibrin of blood, and so on. Though the vegetable proteids are not met with in the same condition exactly as the animal ones, they are nevertheless very much like them in their composition. The aleurone grains of the pea have very striking similarities with the globulin found in muscle. A good deal of the substance is soluble, like that, in a ten per cent. solution of common salt, and salt added to saturation to such a solution of the proteid precipitates it in the form of an amorphous mass. Parts of some aleurone grains are soluble in water, and resemble some of the soluble proteid of an animal digestion. The albumin or white of egg is very much like a proteid which is found on the underground parts of the asparagus, which must be accordingly called a vegetable albumin.

If we wish to study the deposition of proteids in these vegetable reservoirs, we turn to the seeds rather than to other parts of the plant. In seeds they are very common. The pea and bean have been alluded to; here they occur in conjunction with starch. Other seeds, such as the rape and the linseed, show them associated with oil. In some seeds they are distributed throughout the whole substance of the embryo; in others they fill the endosperm; in the wheat and barley they occupy a single layer of cell just underneath the outer covering.

In most of the seeds produced by our cultivated plants, the aleurone grains are very simple in structure; indeed they show no structure, being little rounded masses of granular-looking material. In some foreign seeds, particularly the seeds of the castor oil and the Brazil nut, they are much more complicated. In our own flax we have similar ones. Various solvents need to be used to show the structure, which consists of the following parts. There is an oval casing or matrix, part of which dissolves in water, and the rest in 10 per cent. solution of common salt. Embedded in it is a large regular crystal of proteid matter, which will only dissolve in a saturated solution of salt. This is known as the crystalloid. Between this and the outside of the grain is a rounded irregular mass of small crystals of the double phosphate of magnesium and calcium, which is known as the globoid. This of course is not proteid though it is always embedded in the grain.

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

"No. 15." Your address has been mislaid, please communicate with us "Horjatu." We should like to hear again from you on the subject of your last letter.

["Planters' Library," "Gonibede," "Bangalore" and "Yercaud":—We are afraid considerable delay will elapse before you obtain the books ordered. Our own stock is very small, and two of the firms to whom we passed on those orders which we could not comply with, report being temporarily out of stock.—Ed.]

OUR COOLIES AND THE FAMINE FUND.

DEAR SIR,—I opened a subscription list among my maistries and coolies and they have almost to a man subscribed to it.

We are all about to pay up and get rid of our labour; before he leaves I am certain every coolie will give something from his earnings were he given an opportunity. I have written to the Secretary, U. P. A. S. I., on the subject, and I think the P. O. can help in the good cause by putting the idea before others.

"BET."

DWARF LIBERIANS.

SIR,—I have three diminutive Liberian plants in the nursery which are $3\frac{1}{2}$ inches in height from the surface of the beds and the leaves of which average $2\frac{1}{2}$ inches in length. Three days

*Furnished by J. R. Royle, Esq., C.I.E.

PHELPS & CO. have often been asked why they don't open a branch in Darjeeling, but for that matter they have been pressed for years past to open at Bangalore, Coonoor, Madras, Rangoon, Lucknow, Cawnpore, Delhi, Mussoorie, and even in Nainital but they prefer doing business from their Head Establishment, where the Managing Proprietor can have everything under his personal supervision, and travellers are employed to visit everywhere.

o, when the coffee in the field came into blossom, each of the
ree plants bore a single small flower at the top of its stem,
r want of branches, I presume!) The flowers had the usual
ht petals and have blossomed and set. The seed from which
ese plants were grown was put down on 1st May 1896, and
e seedlings were transplanted from the original beds into
sh ones about the middle of September following. The other
ants in the nursery are double the height of the three flower-
g ones, a flower and leaf of which I enclose.

Can you, or any of your readers, let me know the process
rsued by "John Chinaman" for raising "Tom Thumb" fruit,
., trees, such as used to meet my astonished gaze in China?
"EINOMEN."

NORTH WYNAAD, 26-2-97.

NILGIRI SNAKES.

SIR,—Would you care to insert the following regarding the
ic Polonga" in your valuable paper. Replying to K. V., during
residence of 15 years on the Nilgiris at elevations varying from
000 to 5,500 feet, I have never seen any snakes to answer his
scription exactly, but have seen about 15 to 20 specimens of a
nd that resembles the one he mentions. These are $3\frac{1}{2}$ to $4\frac{1}{2}$ feet
length, thick flat body, colour dull grey, with beautiful black
al rings edged with pale yellow. The abdomen is dirty
nite, fangs "retractile," very large. When annoyed by dogs
coils up and keeps up a continuous hissing that can be heard
to 60 yards away. They are very poisonous and dreaded by
e natives owing to their sluggish habits. I have known a pony
die within 12 hours after being bitten. A dog lately bitten (by
e that was at the time almost cut in twain by a charge of
ot) recovered, but the flesh robbed away, leaving a spot $1\frac{1}{2}$ inch
ameter where the snake struck. These snakes are common all
er the Nilgiris. Their peculiar colour like that of fallen leaves
akes it difficult to detect them. I shall be glad to send K. V. a
ecimen when next I come across one, if he will let me know
ow to send it and to where. The native name is "Kunnady
rian."

KARBEN JOGIE.

KARBEN, 24th Feb. 1897.

CATTLE AND POONAC: COMPARATIVE VALUATIONS.

SIR,—Will some of your experienced readers correct me in
e following figures. I have never done any previous manur-
g, and my calculations are possibly wrong. I want to manure
me tea, and naturally as cheaply as possible.

Cattle manure costs Rs. 1 per ton on the estate, Nitrogen $\frac{3}{4}\%$
Poonac " 90 do. " $10\frac{1}{2}\%$

The usual application per tree is, I understand, about $\frac{1}{2}$ bushel
cattle manure every three years, and about 4 ounces of
ponac every year.

Namely: Cattle manure say 80 tons per acre triennially
Poonac $\frac{1}{4}$ ton " annually.

The cost of 80 tons cattle manure at Re. 1 per ton is Rs. 80,
us application, say Rs. 20 (?) = Rs. 100 per acre every three
ears, or Rs. 33 per annum.

$\frac{1}{4}$ ton Poonac at Rs. 60 per ton is Rs. 15, plus cost of appli-
tion, say Rs. 10 (?) or Rs. 25 per acre per annum.

Cattle manure gives 20 lbs. Nitrogen at a yearly cost of Rs. 33
oonac " 60 " " 25

The conclusion to me seems very obvious: but is it correct?
I am an absolute beginner in manuring, and should be exceed-
gly obliged for any and all criticism on the above.

POONAC.

P.S.—The percentage of the nitrogen in cattle manure is
ertainly higher than the usual run of manure, while that of
oonac is rather lower, I fancy, than the average.

IMPROVED COFFEE SEED.

SIR,—I don't quite follow the advantages of the extra ash in
Mr. Grey's seed. As a marketable coffee, a heavier roasted
bean is of course a great desideratum and soils, like the Babo
Boodens, rich in ironstone, are supposed to produce a very much
heavier bean than others; but as I understand it, it is the organic
matters, oxygen, hydrogen, nitrogen and carbon that are contain-
ed in the seed that form the food of the young seedling and
plant, until the roots are able to absorb their food from the soil.
This organic matter is dissipated when the seed is reduced to
ashes and only the inorganic or mineral constituents remain, but
as I take it this is not what the young seedling wants. I admit
that a plump bean will give a fat seedling, but I fail to see how
an extra amount of inorganic or mineral matter is going to help
us. It is the nitrogen, albumen, starch, &c., which with their
combinations with oxygen after going through the changes
necessary produce the robust seedling in proportion to their
presence. The root then absorbs assimilable matter from the soil
and out of the inorganic or mineral matters produces the fibres,
&c. Of course I may be wrong, my botany, plant physiology,
or whatever it is, is very poor and a bit ancient. Was the coffee
analysis of bean with or without parchment?

What becomes of the mineral constituents in seed?

I am sending a few seed for analysis for comparison. The
seed are from acclimatized Coorgs, grown in a very sandy loam
soil, interspersed with gneiss or granite boulders. Altitude 4,000.
Rainfall 100 inches. Cultivation under partial shade. Manured
oil cake and bone. Western facing. Situation same range as
Cannon's Mysore. The seed is small but regular. I should like
to try some of Mr. Grey's seed, but should like to hear some-
thing more about it and see it discussed.

If you want any more seed from hereabouts or Babo Boo-
den, I shall be very glad to get and send you some.

"BET."

[We thank you much for the seed, and shall forward it to Mr
Grey.—ED.]

THE COFFEE CAMPAIGN.

SIR,—I perused with interest the two letters on this subject
in P. O. of February 20th.

I sincerely hope, as does your correspondent, "Push the Coffee
Cup," that this subject will not be allowed to drop, without
being thoroughly discussed.

I agree with "B. H. E." when he says that much may be
effected by private effort, in promoting the consumption of
coffee. But I cannot agree with him, I must say, when he
says: "I do not think that much good could be derived from
teaching people how to make coffee. The upper classes who
use our coffee find out how to make the most of it." "As one
practical illustration is worth a score of general assertions," I
give the following: I went Home from India some years ago,
and was invited to make a short stay at a friend's. On coming
down to breakfast in the morning, I found that coffee was
always drunk at this meal, and I was handed a cup. But a few
mouthfuls were sufficient to convince me that the cup contained
something very different from the delicious, exhilarating and
refreshing beverage I had always been accustomed to on "the
tote." I could not drink it, it nauseated me! Morning after
morning I went without my accustomed cup of coffee, rather
than stomach this vile concoction, which was erroneously called
"Coffee." I subsequently found out that the lady of the house
used to buy her coffee and chichory (perhaps it would be more
correct to say her "Chichory and Coffee," for I'm sure there
must have been a larger proportion of the former than of the

has been remarked several times that no doubt PHELPS & CO. will raise their prices, now that they
have taken their Ladies' Department to 4, Russell Street, but it is a mistake.

latter in her—what shall I call it—preparation) separately, and mix them herself, her grocer having given her the proportions most probably.

Can a person be said to know how to make a good cup of coffee, who adulterates to such an extent the pure article, so as to make it unrecognizable? Or one who makes the coffee of such strength as to upset people's digestions? I trow not.

I could recite many more instances similar to the above, but consider the one given sufficient to convey what I wish to convey to your readers, i.e. the necessity of waging a war against adulteration, and the mistaken notions as to how a cup of coffee ought to be made. And this I hold can best be effected, in a way, similar to that the tea-planters adopted at the Chicago exhibition, viz.: to dispense numerous cups of coffee gratis to a select gathering, and give them lectures on say, "Coffee—From Plantation to the Cup."

Once public interest is aroused, which is the end to be arrived at, such firms as Messrs. Lyle & Co., of which your correspondent "B. H. E." writes about, can be recommended to the public to supply them with *pure and unadulterated coffee*.

CUP OF COFFEE.

COFFEE IN CEYLON.

SIR,—In the overland *Times of Ceylon* I see you are attacked for the paragraph re the appointment of a Ceylon man to manage the Dumont Coffee Company.

As the para. in *P. O.* was based, I believe, on what I wrote you, I should like to call your attention to the fact that no mention whatever was made in *P. O.* of Mr. Talbot, and no mention of any Planter by name. If you have a Ceylon directory dating back a few years you might be able to throw some light on Mr. Villier's (the man appointed by Mr. Talbot) record. I have a strong impression that he came to Ceylon after my time, (I left in 1888,) or if not he was only a creeper then. You will note the *Times of Ceylon* says one would infer from it that the writer holds the opinion that it was the Ceylon Planter who caused the coffee of Ceylon to die out, an assumption it would be ridiculous to controvert. Nobody would of course hold that it was the Ceylon Planter, but whether or not it was the Ceylon system of cultivation is another point altogether. There is a good deal more in a system of cultivation than is dreamt of in the *Times of Ceylon* Philosophy. Whether there is any connection between leaf disease and clean weeding it is impossible to say; but there is no doubt that the continuous large crops disappeared soon after the general introduction of clean weeding. One effect of clean weeding in coffee in the open is to totally deprive the soil of organic matter and humus for the coffee leaves and prunings are all swept off by the rains. Knowing how fond coffee is of humus it does not require any great stretch of imagination to think that the total deprivation of organic matter is well calculated to affect coffee prejudicially. Any way Ceylon was the only country where clean weeding was the universal system and it is the only country where coffee has been so utterly wiped out. I consider the remark in *P. O.* that it does seem a little strange that the Brazil Dumont Coffee Company should choose as they done a Ceylon man as Manager for their estates perfectly justified. I should think the context of the paragraph objected to would clearly show that it was the Ceylon system that was referred to and no individual planter. In reference to the other cutting from the Ceylon Paper, if you think it worthy of reproduction, I hope I may be allowed to suggest the relevance of Mr. Talbot's Tea and Coffee shipments and sneers at the Nilgiri planters in connection with an appointment in Brazil is probably only obvious to the writer. I don't imagine Lipton with his large dealings in Tea and Coffee poses as an authority on their cultivation or his dealing in jam, bacon and cheese

would respectively induce him lay down the law on fruit growing, pig fattening or dairy farming. I believe I have omitted thank you for your directory, which came safely to hand, and find very useful. I suppose you don't know Mr. D. W. Mepper whereabouts. I sent him some E. L. seed 6 weeks ago and have heard nothing about it.

AN OLD CEYLON PLANTER.

LADY-BIRDS AND BUG.

SIR,—Your correspondent "Black Bug" in his letter to you the 28th January, (this was written before receipt of our last issue.—ED.) which appeared in your issue of the 6th instant brings up a point in connection with Lady-birds (*Coccinellidæ*) which has more than once occurred to me. So many estates in S. India are more or less heavily shaded that the fact of Lady-birds living or not living under shade may become a serious question: I have watched the habits of *Coccinellidæ* very carefully during the past year and a half and have found them under shade. That they are sun-loving insect is only too true but I am inclined to think that as I have found them to do this they will not hesitate to attack their prey under shade although they will return to the unshaded and sunny trees on the estate to live and breed. From what I can gather I believe that the coffee in Hawaii was not to any extent shaded, and where large trees occur they were citrons and as much infested with coccidæ as the coffee. Mr. E. E. Green's opinion on this point would be interesting.

I am not a Collector and have not studied *Coleoptera* in general, but I fancy I could find more than five varieties of coccinellidæ on the coffee in this district. Would "Black Bug" care to have specimens and would he identify them for me? If so I shall be glad to correspond.

I quite agree with "Black Bug" that it is improbable that many varieties of Lady-birds would forsake their natural food to blunt their teeth on Black Bug (presumably "Black Bug" means *Lecanium Coffee* and not *Lecanium nigrum*), but they would hold good with green bug (*Lecanium viride*) which is a soft shelled scale and would probably not only be a more plentiful but an easier prey for the Lady-birds where it is to be found.

With regard to your "occasional note" in same issue of Black Bug.

I shall be very much surprised to hear that *Chilocorus Nigrum* have been found preying on Black Bug (*Lecanium Coffee*). It is quite likely that another variety of coccinellidæ may be at work though. I hope the Kotagiri planter will have given you the details you ask for in your next issue. Would he also kindly send some specimens?

I have just had my attention drawn to a letter of Mr. E. E. Green's in the *Ceylon Observer* of the 6th instant. In this letter Mr. Green suggests that the reason of the slow increase in number of *Chilocorus Nigrum* is due to its natural enemies in this country and suggests an exchange of the different specimens of Lady-birds with Ceylon with the view of experimenting with them in countries where their own parasite may not be found.

This is, I think, an admirable suggestion, and I shall be most happy to exchange some of our coccinellidæ. Just at present unfortunately both the Green Bug and the Lady-birds are difficult to obtain, but in another month specimens should be fairly easy to obtain.

I am only afraid that Ceylon and S. India are too nearly allied to make it impossible that parasites may be found in both countries or at any rate that the specimens one exchanges may be so nearly allied that the parasites will not hesitate in transferring their attention from the exported to the imported Lady-birds.

However, as Mr. Green says the experiment would be interesting.

Ladies in the mofussil do not always realize that they can by corresponding with PHELPS & CO. at their Ladies' Branch at Russell Street, keep in touch with all that is newest and most fashionable in the world.

sive and easily carried out, and I think (and hope) may re-
t in practical mutual benefit.

PILLAVALY ESTATE, HOWARD NEWPORT,

COFFEE.

Colombo climate. The Colombo climate has much
to answer for. Among other evils
has developed the acerbity of editors of newspapers to a
uly Yankee pitch. As witnesseth the following: A Brazil
mpany gets a man from Ceylon to report on its coffee
antations. The coffee industry in Ceylon being practi-
lly wiped out, we expressed our surprise that the Brazil
mpany did not go elsewhere. This enraged our worthy
ntemporary, the *Times of Ceylon*, who most ludicrously
uses us of jealousy of a certain Mr. Talbot, the Ceylon
anter who reported on the Dumont plantations in Brazil.
e learn with much interest that this gentleman ships
ore tea in a month than the Nilgiri district does in a year,
d as much coffee as the whole Nilgiri district put to-
ther, but do not quite understand the bearing of this
news" on the subject. We cannot find time to reply
ore fully to our contemporary's irate but amusing remarks,
it may mention that elsewhere a correspondent—an old
eylon planter—has something to say on the subject.

Mr. Robert Elliot's letter on this
important subject well shows how
comparatively easy it would be to bring the coffee campaign
a successful issue. Just at present the plague scare may
nder it difficult to do much in tapping new markets, but
ere is no reason why a beginning should not at once be
ade in England. The possibilities of the proposed
cket trade are proved by the details of the "war of
tes" between the two largest coffee firms in America.
ne of them has built up its huge trade almost entirely on
patent process of "glazing" or hermetically sealing their
ffee immediately after roasting. This of course preserves
e full flavour and gives the minimum of trouble to the con-
mer. It should not be impossible to do something in the
me way to encourage the sales of our own high flavoured
ean. Everything that brings the producer into nearer con-
ct with the consumer is of great mutual benefit, resulting
a cheaper and better article for the latter and higher
ices and larger sales for the former. Mr. Elliot truly states
at much of the Mysore coffee is bought up at greatly en-

hanced prices by the large grocers immediately after the
public sales. This was pointed out in our issue of January
9th by an extract from the *Produce World*, a journal con-
ducted by a large firm of produce merchants, Messrs. John
Haddon and Company, who may surely claim to be in the
"know." There is one thing to be remembered, wholesale
sales mean wholesale prices. By selling on commission, a
bag at a time, it is not improbable that planters could get
fully twenty to twenty-five shillings more per cent.

The European Market. At the Dutch sale on Tuesday,
the first of the year, the moderate
amount offered, says the *Produce Markets Review* of the
6th February, sold at an irregular advance of $\frac{1}{2}$ to 3 cents
over the valuations. Here the market has continued in
the same starved condition, the arrivals that were expected
having been further delayed, and the auctions having
contained only very small quantities. Yesterday there
was a rather better supply of new crop Costa Rica,
including some of the most favourite marks; the quality
was good, but not equal in appearance to the first shipments
of recent years. The demand for them was very strong,
and extreme prices were paid; there can be little doubt
that such prices will not be maintained as soon as a
better supply arrives. A small consignment of new crop
Neilgherry was also offered on Wednesday, and the quality
was only medium, but very full prices were paid. In other
descriptions there has been a good demand for coloury
sorts, but pale kinds have sold rather irregularly. In
the terminal market a fair business has been done at
steady prices, although the tendency has been to lower
quotations.

Curing and prices.

In reply to an article that lately
appeared in this paper, an experi-
enced planter gives it as his firm conviction that until the
character of the cultivation and pruning, as well as that of
the curing, is changed in Brazil, South Indian Planters
may keep an easy mind. He holds that a pruned bush
cannot fail to give coffee of far higher quality than an
unpruned tree. Further, that our cultivation and manuring
also has an enormous effect on the value of the bean, and
lastly that our climate gives the final guarantee that Brazil
will never be able to compete in the higher grades of the
market. This may be comforting, but to us is not quite
convincing. A few facts in support of the above conten-
tions would be more to the purpose.

In an interesting article on the situation, a writer in the
Calcutta Planter remarks :—

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't
OMy.] despair, even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

The greater part of Brazilian coffee is cured badly, similarly to the Native coffee out here. It is dried in the cherry, and then deprived of the pulp and parchment by the aid of machines. The only difference is that the people here use pounders. But it is to be borne in mind that some of the coffee in Brazil is washed; and that, as Simmonds says, the quality has been so much improved of late years that much of the coffee is sent to Europe and sold under the names of Java, Ceylon, Martinique, San Domingo, and even the famed Mocha. At the Paris International Exhibition Brazilian coffee was awarded a gold medal over all other coffees. We must not run away with the idea that American coffees are in themselves inferior. Their inferiority is due to bad curing. Indeed Simmonds himself has emphatically declared that an impression which some have that American coffee is inferior to the Eastern, as, for example, the Java, and far famed Mocha, is erroneous. On the contrary the coffee raised on the highlands of Nicaragua and Costa Rica is unsurpassed for strength and a delicate aromatic flavour unknown to the best coffee of the East; and the fruit of the lowland and medium elevations is far from inferior. Although not having the plump form or peculiar bluish tinge which are the characteristics of the excellent coffee of the highlands, it compares favourably with the coffee of Java or the Moluccas. So Brazil has only to adopt an improved method of curing to become a dangerous rival to India, where, by the way, the greater part of the best land in coffee districts has already been taken up, leaving little room for increase of production.

TOPPING.

If the stem be cut immediately above the topmost pair of primaries, there is the danger of the stem getting split by the weight of fruit on the branches, or by coolies pressing with their arms on them. To obviate this it has been recommended that the stem be allowed to grow up one joint above the highest branches it is intended to leave; then take off the pair attached to it within the first pair of leaves, thus forming a small cross at the top. By this means, it is said, the top of the stem will be strengthened, and as the suckers always spring from the highest buds left on the stem, their removal will be facilitated. Rather I should think that the short stem left will dry down to the first pair of permanent branches left, and there would then result about the same amount of danger of the stem splitting as in the first plan of topping as described above. I have found it the most satisfactory to cut the stem and one branch, at the exact height at which it is intended that the plants should be, taking care in each case to leave a short stump. These stumps die back to the joint at which the branch has been left, and a hard knot is formed at this point. The top of the tree in this method is like the letter L reversed, *l*, and there is no danger of splitting.

In topping it is always well to comply with the following rules:—In cold climates or in poor soil top the trees low, as in both cases the trees will not naturally grow to any great size. In situations exposed to strong winds for prolonged periods, the trees should also be topped low, even if the soil be rich, because if allowed to grow up too high they would be much shaken and hurt by the wind. The height at which trees in exposed situations should be topped depends of course on the strength and violence of the wind, and perhaps in a minor degree on its duration. It would be safe to say that a uniform height of 2½ feet would be just the thing for exposed situations; but it has sometimes been necessary to keep trees down to two feet and even lower. In one case I have heard that it was only possible to grow trees, and that only in the sheltered valleys, by topping them above the second pair of branches from the ground, and after they became sufficiently strong letting up a sucker and topping that in the same way; and so on till a tree of about from 1½ feet to 1¾ feet had been attained! But that is "another story." On sheltered rich land in every way suited to the growth of coffee, the trees may be allowed to run up to a height of even five feet. But this is inconveniently high for the tree to be worked to the best advantage; I mean in pruning, handling, and gathering crop. In no case therefore should the height of a tree exceed four feet. In all cases where trees are topped low of course it will be necessary that they be planted sufficiently far apart to obviate their becoming too much entangled, as the lateral growth is greatly extended by low topping.

It is, however, of the greatest importance to keep the ground well covered, as this keeps it cool and tends in a great measure to keep the borer in check. As a general rule six or six and a half feet may be stated as the safest distance apart at which to plant when low topping is adopted.

There is also a good and a bad time, it is stated, for topping trees. If they are topped directly they have attained the proper height this tends to make them bear too heavy a maiden crop, which would occasion much harm to the young trees. It has therefore been recommended that the trees should be allowed to go on growing after the flowering period, when it would be impossible for them to overbear, owing to much of the sap being expended in upward growth. But I think this plan tends to the weakening of the lower branches, the sap being drawn upwards, and they being deprived of their due share of nourishment. Hull characterises it as an "absurd waste of sap, vitality and lime." I think a far better plan, as practised in many cases here, is to top the trees when they have reached the required height, and if after the blossom has set it is found that they are overbearing, strip the berries directly after they have formed off the green wood of the branches, which will be towards their ends. Stripping the fruit thus early will prevent waste of vitality, etc., and strengthen the branches.

Topping, it has been well said, "declares a war with nature that admits of neither peace nor truce. The enemy immediately throws up, from under the highest pair of branches left, two or more supplementary stems, and renews them as often as they are removed." The constant removal of these suckers forces the sap to expand itself in lateral growth, and if the tree were left to itself it would soon become an entangled mass impervious to light and air, and consequently deficient in the powers of producing fruit. It is this that necessitates handling.—*The Planter.*

COFFEE CULTIVATION WITHOUT MANURE.

THE ASSIMILATION AND UTILIZATION OF ATMOSPHERIC NITROGEN.

In the growth of legumes in coffee whether plants or trees, there is one great point to be considered, to which perhaps sufficient attention has not been paid, that is that the amount of atmospheric nitrogen varies in direct proportion to the quantity and size of nodules on the roots. An examination of leguminosæ will clearly illustrate this, some having only a few nodules and others covered

Nitrogen and nodules. with them. It is a well-established fact that the assimilation of nitrogen is coincident with the development of nodules, and I will now proceed to prove that the amount of nitrogen varies with the size and quantity of nodules. To prove this I will take the best available authority on the subject, Dr. Voelcker quoting from "Nitrogen." The process by which leguminous nodule-possessing plants assimilate free atmospheric nitrogen is that the bacteria in the nodules are gradually changed into a particular form known as "bacterioids," and it is by virtue of their network arrangement in the cells of the nodules, that presents the largest possible surface to the air that they are enabled to absorb the free nitrogen of the cell sap and render it assimilable for the plant. Hence it follows that the larger the nodules, the greater surface is presented to the air; and conclusively proves my first point that in judging the value of a legume the size of the nodules is, next to the quantity, the most important factor to be taken into consideration. In reference to the quantity we read: "If in a soil already exhausted by heavy leguminous cropping, of its neutral bacteria, there be put in another leguminous plant which is not closely related to the previous one, there will no longer be the conditions present for the formation of nodules, or else this formation will be so meagre that it has but little value for the nitrogenous nourishment of the plant." This I take it proves my second point that the quantity of nodules is of great importance, and substantiates my statement that in judging of the manurial value of a legume the size and quantity of nodules are of primary consideration. The manurial value of legumes compared with other green manures consists principally in the amount of atmospheric nitrogen they have taken up. I write principally, advisedly, for it is by no means the sole advantage they have, other advantages being the higher root solvent power of legumes. solvent power of legumes compared with other

nts, and the fact that the *Bacillus Radicicola*, the nitrogen extract-organism, has the additional power of elaborating phosphates and cash from the soil. The superiority of legumes as green manures is admittedly uncontested, but what is perhaps not so generally recognized is that legumes vary in their value among themselves, *i.e.*, applying the rule test I have just indicated. An examination of the roots of legumes will show such a great variation in the nodular growth that it is evident that although botanically a legume is a legume, yet for practical purposes of manuring the title of legume is by some legumes more or less assumed under false pretences. Should anyone desire to convince himself of the importance of nodules in the healthy development of leguminous plants a visit to a vegetable garden will probably satisfy him. Take a bed of dwarf beans for instance, the beans themselves will vary most probably in appearance and crop; an examination of the roots will prove that the most rigorous growth and the heaviest crop is coincident with nodular development, and if by chance there could be any half-starved beans bearing very poorly, an inspection of the roots will show that they are innocent of nodules. I trust I have established my point that in growing legumes, whether as shade trees or as a crop for digging in, the nodule growth is of primary consideration; as unless there is considerable nodular growth the atmosphere is not called upon to any great extent to contribute to the enrichment of our soils. Absence of nodules simply means that the soil alone is the source of nitrogen in the legume, which creates an injurious competition between the coffee and the shade tree or even crop for digging in; as the demands on nitrogen by leguminosæ are unusually high compared with other crops, and if the demand has to be met entirely from the soil, it is more than likely that in the competition between a leguminous shade tree devoid of nodules and a coffee bush the latter will come to grief. To instance the case of a leguminous tree that has no nodules or practically none I may mention the Gold Mohur tree (*Poinciana Regia*); its fatal effect on coffee is thus clearly explained. There are many varying degrees of nodules as an examination of the roots of indigenous leguminosæ will clearly show, what I want to impress on my fellow-planters who are trying or going to try legumes, that the *size and quantity* of nodules is a sure and certain test for their manurial value as the amount of atmospheric nitrogen taken up by leguminosæ is plainly in proportion to their size and quantity. The advantages of growing leguminous crops and ploughing them in are well known in Europe and I believe that more profitable use might be made of them in coffee cultivation. To instance the case of clover as a preparatory crop for wheat is a quote perhaps the best known instance. It is a matter of common knowledge that a clover stubble ploughed in affords the following wheat crop the nitrogenous nourishment it requires. In growing leguminous crops the one thing that has been clearly established is that it is essential that there should be an ample supply of microbes. This has been proved by the success of inoculating soils with soils in which leguminous crops have striven. An application of 16 cwts. of suitable soil per acre has been found sufficient to inoculate land with the appropriate microbes for leguminous crops and ensure a successful growth, the resulting produce without, and with inoculation being as 100:552. All this goes to prove the importance of growing legumes that suit the bacteria present in the soils. I am inclined to think that there is no need for soil inoculation; that there are plenty of neutral bacteria capable of entering into symbiosis with appropriate legumes, I hold Nature demonstrates, from the frequency with which she grows legumes in abandoned land, for instance the sensitive plant (*Mimosa pudica*), a weed which is common in the highways and byeways from almost sea-level to a very considerable elevation. This I think proves that the *Bacillus radicicola* is present in our soils, and all we have to do is to propitiate him by growing legumes that he is fond of, increasing his activity by cultivating his appetite. Evoking the activity of the *B. Radicicola* is a very important thing, as there is no doubt that with the *B. Radicicola* as an ally we can obtain all the Nitrogen that coffee wants and probably all the mineral constituents, the mineral constituents removed by coffee being remarkably small. The application of green manuring to ordinary farming in Europe is apparently meeting with some success, as the following quotation from a comparatively recent issue of the *Royal Agricultural Society's Journal* will show: Dr. Deblinger, soon after taking possession of a farm near Darmstadt, decided to sell nearly all the cattle, of which a considerable

number had been kept, and to adopt green manuring, supplemented with artificial manures, in the place of stable manure. Several years experience convinced him that the system is more economical than any other, the cost of nitrogen in pea and vetch manuring being estimated at rather less than a penny a lb. as against seven pence in nitrate of soda, tenpence in stable manure." The application of green manures to coffee is a simpler affair than their application to farm crops in Europe, each removing mineral constituents in varying proportions. In dealing with coffee we have one unvarying crop of known constituents and are able to supply the mineral constituents by growing a shade tree containing the same mineral constituents as coffee. This is one of the reasons I believe why *E. Lithosperma* has been so successful as a green manure (*vide* "Legume's" letter in *P. O.* of Feb. 6th). Its nitrogen is largely atmospheric and it is capable of assimilating phosphoric acid and potash in forms which are unavailable to the coffee roots. I am gratified to find that the claims originally advanced on behalf of *E. Lithosperma* have been vindicated. There were two claims originally advanced. That the tree was an extremely rapid grower, and that the cuttings and lopings were a valuable manure. The first claim has been amply justified and that the second should be equally so is hardly surprising, considering the analysis, in fact it would be more surprising were it otherwise. In the light of recent scientific publications I now advance a third claim; that is, that it has the power of assimilating atmospheric nitrogen to a very unusual degree. There seems to be some special fascination in the rootlets of *E. Lithosperma* for the *B. Radicicola* and they seem to increase and multiply to a tremendous extent. An examination of the rootlets of an *E. Lithosperma* will prove the truth of this further claim, and a comparison of its rootlets with those of other leguminous trees and plants will convince anybody that for *size and quantity* of nodules on the roots and the resulting assimilation of atmospheric nitrogen that *E. Lithosperma* is uncommonly bad to beat. I have found nothing to be compared with it among all the Indigenous cultivated trees and plants that I have examined. We have been informed that in Java the tree was especially valued for improving the soil by its root growth. I think we have the true explanation in the fact that its rootlets are so peculiarly palatable to the *B. Radicicola*. During the wet weather the tree makes enormous quantities of nodule covered rootlets which die off every hot season; these, I imagine, cause the enrichment of the soil. A question naturally arises whether more use could not be made of those rootlets than allowing them to come to a natural end. I think myself that it might probably be more advantageous to prematurely terminate their existence. At the close of the fine weather they are not wanted as plant food, for that is the very time when there is most soluble plant food on the ground, as the nitrates which have been carried down below the reach of the coffee roots in the wet weather are then recovered by capillary attraction; so the additional supply in the form of the dead *E. L.* rootlets is not then required. All the experiments made with it as a green manure go to prove that it is extremely quick acting and has almost an immediate effect. The leaves and cuttings decay at once and the nitrogen in them might, I believe, for immediate solubility and availability be fairly considered as nitrogen in the most expensive form, *viz.*, nitrates. I believe that the earlier the trees can be cut and applied the better, and that if it can be done by the end of June or not later than the end of July so much the better. This has an immediate action, is of the greatest assistance in running the coffee through leaf disease. I even think that a May manuring might be even better still. Later on, say August—September, after the worst of the rains are over, is, I believe, the time to make use of the root growth of *E. L.*, which I have every reason to believe can be done by digging freely. The rootlets are then in the active stage, and I know no reason why they should not have as beneficial effect on coffee as clover roots have on wheat. Wheat is a nitrogen exhausting crop, and with leaf disease and the monsoon coffee is also, and I know no reason why the roots of *E. L.* should not be as rich in nitrogen as clover. The shoots of *E. L.* are richer in nitrogen than clover is, and the roots have an infinitely greater nodule development, so I think it is a very fair presumption that *E. L.* rootlets which are then developed in enormous quantities

are at least as efficacious for coffee when broken by digging as a clover stubble ploughed in is for wheat. There is every reason to believe from small experiments that the root growth can be utilized in the manner indicated. The results have been so satisfactory that all the coffee under E. L. shade will be so treated this year. Thus E. L. is a tree that can be made to provide coffee with two manurings yearly with nitrates, and the digging of the roots could be also supplemented by another application of the cuttings without interfering with the requisite amount of shade. To those who doubt the possibility of a green manure supplying all coffee wants, I would call their attention to the amount of mineral constituents removed by coffee and replaced by the shade loppings. I only take note of the minerals, for the atmosphere supplies the nitrogen. The amounts of Phosphoric Acid, Lime and Potash removed according to Mr. Hughes by a 7 cwt. crop of parchment on respectively 2-8lbs., 3lbs. and 18-1lbs. The theoretical dose of E. L. to replace the crop removal would thus be only some few cwts. per annum, whereas instead of cwts. it is available by tons. With a view to settle once and for all the claims of leguminous manuring in general and E. Lithosperma in particular, I would suggest a very simple test. Interplant a small acreage of coffee between each coffee with E. L. and when the shade trees are 12 months old thin them out to 15ft. x 15ft. cutting up and applying *green* all the cut out trees. The trees should be cut down at or below the level of the ground so as ensure the immediate decay of the roots.

Putting E. L. to the proof.

I need hardly say that the better the coffee the better would be the results, as there would be more feeding roots to make the most of the generous supply of plant food. The extra cost of close planting would be recouped many times over by the tons of nitrogenous organic matter. E. L. as a manure would be made or marred. It would be a simple test and would bring the claims of E. Lithosperma to a definite and early conclusion:

"He either fears his fate too much or his desserts are small,
Who dare not put it to the touch to win or lose it all."

It is because I have no fear for the fate of E. L. that I suggest this expeditious method of putting it to the touch, while the stake I am playing for is surely a grand one to win. If not the complete abolition of manures at any rate, the certain elimination of any expenditure on the most expensive element nitrogen, would mean above the saving of many lakhs of rupees yearly. This is surely a grand stake to play for and win.

ARIENKOW,
SHENCOTTAH, 14th Feb. 1897.

COFFEE PLANTING IN BRITISH CENTRAL AFRICA.

(From *Chambers's Journal*.)

BY MR. H. D. HERD.

ALTHOUGH by the latest arrangement between the British South Africa Company and the Foreign Office with regard to these territories in 1894 the area over which the British protectorate immediately extends has been considerably lessened, there still remains under the direct administration of Her Majesty's Commissioner a country equal in extent to the area of Great Britain.

This country extends from Lake Nyassa on the north to a point on the Shiré River near its confluence with the Zambesi on the south; but the district to which our attention is more particularly directed is that tableland lying between the Shiré on the west and the borders of the protectorate on the east, and perhaps best known as the Shiré Highlands.

Here is the latest home of coffee; and seeing that the country has now passed through its little fever of wars with the Arab slave-traders on its borders, and peace seems to have come to stay, we think that the present position of its staple industry and its future prospects merit a wider publicity in the interests of those to whose enterprise and hardihood the country owes what prosperity it has.

The history of coffee in Nyasaland dates back only to the year 1878, when three small coffee plants from the Edinburgh

Botanical Gardens were taken out by Mr. Duncan, the gardener to the Church of Scotland Mission at Blantyre, and planted in the mission garden there. This was done at the energetic representations of Mr. John Buchanan. In the year 1880 the sole survivor of the three plants brought out by Mr. Duncan bore a crop of about one thousand beans. From the distribution of the seed, three years later, may be dated the beginning of coffee-planting on an extensive scale; but in 1881 the first serious attempt to put coffee on the home market, and to gauge its value as a commercial product in competition with other coffee, was made by the late Mr. John Buchanan, of the firm of Buchanan Brothers, whose name is so honourably connected not only with the commercial but the political development of the Shiré Highlands.

A sample of the first crop was sent home for valuation, and was quoted in the London market at eighty-five shillings per hundredweight.

From this time onward the unsettled state of the country made the future of coffee very uncertain, till in 1889 the declaration of a protectorate restored confidence and gave great impetus to the industry. Messrs. Buchanan Brothers opened up large plantations at Zomba, Michiru, and elsewhere while the African Lakes Company's coffee at Mandala continued to do well. Mr. Brown, of Ceylon experience, settled in the Mlanje district, which had been strongly represented by the late Rev. Robert Cleland as exceptionally well suited for coffee, and Mr. Duncan, having now left the mission, opened up a plantation near Blantyre.

From this point, so rapid has been the progress made, that the late Mr. John Buchanan wrote in *The Central African Planter* for October 1895 that no less than one hundred plantations had been opened up under the respective interests in the country, and that these plantations represented an area of six thousand acres under cultivation. The local revenue rose from nothing to £20,000 per annum in five years.

The services of Mr. Buchanan were recognised by the Government, and he received a C. M. G. in 1890. Much to the regret of every one, he died on his way home for a holiday on 9th March of this year.

Mr. E. C. A. Sharrer is now the largest owner of estates in the protectorate, amounting to about three hundred and sixty-five thousand acres, of which only about nine hundred acres are under coffee. It has been suggested that planters should also turn their attention to cotton-growing. Tobacco and tea have both been introduced.

So extraordinary has the development been during the last few years, that since 1889 the quantity of coffee exported has increased in an almost geometrical progression. The exact figures have been:

						Tons. Parchment
1889	...	...	...	...	...	5
1890	...	...	...	...	...	—
1891	...	...	...	...	...	10
1892	...	...	...	...	...	—
1893	...	...	...	...	...	42½
1894	...	...	...	...	...	74
1895	...	...	...	...	...	146
1896	...	...	...	(estimated)...	...	350

The year 1897 is looked forward to as likely to prove a record year, chiefly because a very large number of plantations come into bearing for the first time in that year; some planters being so sanguine as to put the yield at twelve hundred tons of 'parchment'—as the raw coffee is called before the membrane covering the seeds is removed.

The varying degrees of success attained have been due to many different causes, arising mostly from experience in trying to reconcile the approved methods of coffee cultivation

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

One Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Richy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Un-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Cair Matting of every description, from the finest quality Twill to Common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 9 ft. by 3 ft.

Quotations and further particulars will be furnished by our Mellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS.

"Englishman," August 1st, 1896.

APPRECIATION OF AN INDIAN MIXTURE.

Messrs. CHILD & CO.,

The Wholesale Tobacconists of Chowringhee, are in possession of an autograph letter from Mark Twain.

"Indian Daily News," August 1st, 1896.

Mark Twain left a substantial memento of his visit behind him in Calcutta in the shape of a letter addressed to Messrs. Child & Co., and an old Mississippi pilot knows what good tobacco is, even when he takes to literature.

MARK TWAIN.

Calcutta, February 8th, 1896.

MESSRS. CHILD & CO.

SIRS,—This is the brand I wanted. I have smoked your Honey Dew Mixed in another part of the world, and learned to prefer it.

Truly yours,

S. L. CLEMENS.

CHILD & CO.'S HONEY DEW MIXTURE

Is prepared from the four finest growths in the world, viz:—

Sun-dried Virginia (sweet and mellow), Old Kentucky (full flavoured), Turkey Dubec (mild), Latakia (fragrant). All finely matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength,
WITH DELICIOUS FLAVOUR.

THE FINEST THAT CAN BE MADE. NO EQUAL.

In $\frac{1}{4}$ lb. air-tight tins, Rs. 2-8 per lb.

CHILD & CO.,

WHOLESALE AND RETAIL TOBACCONISTS,

MESS AND CLUB CONTRACTORS,

2-22, 2-23, CHOWRINGHEE ROAD, CALCUTTA.

GENERAL PRICE LIST ON APPLICATION.

CALCUTTA

Ceylon and India with the conditions of the new country; and partly also from local difficulties, as for instance the labour question, which were unforeseen, and could only be resolved as they presented themselves.

In the early days there was an abundance of local Yao labour, but the supply was irregular and unreliable. Constitutionally indolent, the natives in the immediate neighbourhood of the plantations were soon satiated with calico and other better goods; and in the wet season, just when labour in the plantations was most needed, there was none to be had, as the villagers had betaken themselves to the hoeing of their own gardens. The necessity for a reliable labour supply being evident, an attempt was made to bring down Atonga labour from the west of Lake Nyassa, which was entirely successful, the new-comers readily engaging to work on the plantations for several months at a time, and this at the most important period of the year, the wet season.

It is hoped that, acting in conjunction with the Portuguese Government, the promoters of this scheme may be able very shortly to extend the line all the way to the coast at Chinde.

A further step in advance was made by inducing the Angoni, an offshoot of the Zulus, and long the scourge and terror of the Shiré Highlands, to accept work in the dry season on the plantations; and now, instead of coming down in their thousands to devastate the country, they lay aside the shield and spear, and handle the hoe with equal skill. Only last year another large field of labour supply was opened by the abjuration of some disaffected chiefs on the north-eastern slopes of Mlanje. The Walolo, occupying a vast tract of hilly country to the east of Lake Shirwa, had for some little time been venturing down in small companies to work for the Europeans, but by the timely action of Sir Harry Johnston, Her Majesty's Commissioner, against these chiefs, the whole Walolo country has now become accessible to European influence. It is evident that there is every prospect of an abundant labour supply, and in this respect the outlook is very bright.

The chief drawbacks to coffee-planting have hitherto been the labour question mentioned above, and the inadequate and expensive means of transport. The Shiré is navigable for the present flotilla of steamers plying upon it as far as Chiromo, three days distant overland from the coffee district. For a very few weeks during the rainy season it is possible to reach Katunga, a point about twenty-eight miles from Blantyre, from the plantations to either of these points the coffee crop is carried in bags on the shoulders of coolies. The risk, inconvenience, and expense attached to this mode of transport have been greatly felt, but even this difficulty is about to be met by the construction of a narrow gauge railway line which will run from Chiromo to Blantyre, passing through or near many of the largest plantations.

The reckless mode of agriculture followed by the natives, by which they clear large tracts of forest land on which to make their gardens, is becoming so serious a question that the expediency of legislation in the matter has been considered. It is well known that deforestation is followed by a decreased rainfall, which reacts not only on the coffee crops, but on the health of the European. And where such wholesale clearing has taken place, land which might otherwise have been good for coffee is rendered temporarily useless for want of shade.

Efforts are being made to lessen the various circumstances disadvantageous to coffee by better systems of irrigation, planting of shade trees, and manuring. As showing the enterprise which is so prominent a characteristic of those Central Africa pioneers, it might be stated that during the

past year a 'Chamber of Commerce and Agriculture' has been formed, which promises to do much good in securing authoritative and unanimous action on the part of the planters in questions affecting their interests. But perhaps, above all, the *Central African Planter*, started last year and so ably conducted by Mr. R. S. Hynde, F.R.S.G.S., in the planting interests, is an unequivocal sign of a very bright and prosperous future for coffee in Nyassaland.

By the foresight and discretion of Her Majesty's Commissioner, who has given the industry much encouragement and consideration, the danger of introducing the leaf disease so common in Ceylon and India has been averted. No seed is allowed to be introduced into the country, even though sterilised, and although some inconvenience has undoubtedly thereby arisen, the risk justified the stringent measure.

The eyes of Ceylon planters have been for some time turned to Nyassaland, and in 1895 was formed the 'Nyassaland Coffee Company, Ltd.,' with a capital of three hundred thousand rupees. The quality of the coffee has been highly spoken of by the London coffee brokers, and it holds its own with the best Ceylon and Mocha coffees.

The late Mr. John Buchanan estimated that to bring a plantation of say two hundred acres into bearing in the third year would require an expenditure of two thousand to two thousand five hundred pounds (sterling). And he cautioned planters against allowing the trees to bear too heavily in the maiden crop, as there is a danger of the plant being thereby weakened.

Other estimates put the expenditure at *not more than* ten pounds per acre, or a little over three pounds per acre per annum for three years, and thereafter a large profit. The price of Nyassaland coffee as quoted in the London market for last year has averaged one hundred shillings per hundred-weight, but it has reached as high as one hundred and twelve shillings.

Under varying conditions the average yield per acre is somewhat uncertain, but competent judges put it at from three to four hundredweight per acre. Some maiden crops have yielded eight hundredweight, but not without injury to the plants.

Taking four hundredweight as the average, on a plantation of two hundred acres, this is equal to forty tons, with a selling price in London of four thousand pounds. From this, of course, must be deducted freights, which will not be less than eleven pounds per ton from the plantation to the market.

In the report on the protectorate by Commissioner Sir Harry Johnston, issued in August last, there is a valuable appendix devoted to the coffee industry, with a map of the southern Shiré Highlands devoted to coffee-planting. We learn from it that a survey for the proposed railway connecting Blantyre with Chiromo has been made, that the native population in the Lower Shiré district since the suppression of the slave-trade has increased from 1,000 in 1891 to 14,385 in 1896, and that if malarial fever could in some way be eliminated, British Central Africa would be an earthly paradise. The chief bane of British Central Africa according to the Commissioner is that 'accursed spirit whisky.' The exports have doubled during 1895-96, and not a little of this increase is due to ivory and coffee. Sir Harry Johnston entertains great hopes of the development of the negro of Central Africa. At Zomba there is one European head-printer; all the other printers are natives, who have been either locally trained at the missions or by the head-printer. The Commissioner has also an encouraging report regarding mission work in British Central Africa, and special mention is made of the work of Dr. Laws and others at Bandawe, concluding 'that it has only to tell

the plain truth and nothing but the truth to secure sympathy and support.'

Three species of liliaceous plants, of easy propagation, promise to yield fibre worth nearly £40 a ton. India rubber is another product which it is hoped may be largely developed, as the demand for it at present almost exceeds the supply. We are told that 'given abundance of cheap native labour, and the financial security of the protectorate is established. The European comes here with his capital, which he is ready to employ to almost an unlimited extent if he can get in return black men who will, for a wage, work with their hands, as he cannot do himself in a tropical sun. It only needs a sufficiency of native labour to make this country relatively healthy and amazingly rich. The cultivation of coffee would be a hundred times more extensive than it is if there were an adequate labour supply.' For unskilled labour three shillings a month, with or without food, is paid, and proportionately less for women and children. Skilled native labourers—carpenters, masons, brick-makers, &c.—receive wages of from four shillings a month to £40 a year. There seems to be every reason to believe, in accordance with the opinion of the oldest and most experienced planters, that the prospects of success in this industry are very hopeful. Considerable areas of land suitable for coffee are yet to be had, the price varying from five shillings to twenty shillings per acre, and no doubt as the country is better known, and more capital is introduced, the difficulties which have kept back and hampered its development will rapidly disappear, and British Central Africa will yet become, if not the most extensive, perhaps the most successful coffee-growing country in the world.

TEA.

PRUNINGS: A WASTE PRODUCT.

We lately had some remarks in this paper on the possibility of finding a profitable use for our tea prunings, which are at present a waste-product, constituting in many cases a serious danger to the welfare of our tea-plantations. Among other possible methods, we suggested the manufacture of theine and caffeine, and are glad to state that we have just received an interesting communication from Mr. Thos. Christy of London on this very subject.

His verdict is not altogether favourable to the feasibility of our suggestion, and his opinion, as that of one of the few who have studied the question at all seriously, is entitled to a careful hearing. He says: "After several experiments the experience is that the old leaves or twigs that are cut off contain a very small amount of caffeine, certainly not sufficient to make it worth while drying, baling and shipping the raw material to this country. I have tried the leaves picked at different seasons of the year, also the leaves that have been dried out of doors after being out from the bushes, and the percentage of caffeine obtained hardly ever varies.

Ship to China.

My advice to people in India is that it may be worth their while to collect these leaves when green, and perhaps fire them, cut them up, put them into bales and ship them to China, especially if they can get a low freight. Having lived in China, I know what the Chinese will buy, because we stand on different premises when we think about tea-drinking in England, or in India, or in China. Everyone drinks tea in

China, and I am sure these coarse leaves would be greatly appreciated by the Chinese, if they are not killed by the heavy duty, and they ought to be shipped into China and classified as "Drugs." These prunings, at some future date, may be turned to account when caffeine or theine (which is the same thing) is made in India. The caffeine predominates in the young leaves at the top of the plant, and as you descend down the plant, nearer the ground, the branches and larger leaves contain less caffeine. We have now had our third season since we induced planters to ship over to England the sweepings of their warehouses after collecting and packing it into bales under pressure. The small flower [Bloom off leaves, i.e. hairs round the leaf buds—Ed.] off the plant, sometimes called "Fluffy," mixed with this dust and it yields a very good percentage of theine; in some instances it fetches as much as 3d. 3½d. per lb., if there is not a large quantity of extraneous matter in it, such as rubbish and sand.

The making of theine.

This is a question which can only be answered by a manufacturer, and then again by some one who knows the circumstances such as temperature and the cost of spirit in India. The question has been put to me many times, owing to the tea sweepings from all the warehouses in London passing through my hands. I need hardly state that it is my opinion that, since the manufacture of theine has been introduced into England, the two houses that make it here have no doubt greatly improved by experience in the process of extraction. That caffeine can be made in India I have proof, because chemists in Assam have manufactured caffeine from the waste tea in the laboratory, and have sent it home to me in its rough state and also in a finished state of crystallization. That made in the rough form was as good as that ordinarily received from Germany, but I advised that if they continued to make caffeine in Assam, and could do it satisfactorily, it would be better not to bring it up to its high state of purity and crystallization, but to extract the alkaloid and send it home in its rough form. What we have seen has been so pure that with small amount of treatment it would be equal to that of the caffeine-makers in England, but the quantity was only an ounce. I understand that there are a great many chemists in the tea districts on estates, and medical men who have studied this subject, and there ought to be no difficulty in arriving at a result, but bear in mind you have to set against this, cheap packing, low freights down to the port, and low freights home; then we take this tea from alongside the steamer so that we have no dock charges to pay, and the Customs take possession of it in the dock and do not part with it until they have seen the whole of it denatured, that is to say destroyed with asafoetida and petroleum.

Tea gum.

If some of your friends had time it would be very interesting to them to boil out the gum from the stems, twigs and leaves of the tea tree, then strain it off and harden the gum, and when quite dry it could be shipped to England in boxes. This has considerable medicinal value.

Referring to the manufacture of theine, or rather a rough form of it, we reproduce a paragraph that appeared in our paper in last June: "I would advise, says a writer in a home

per, the extraction of the tea leaf refuse with boiling water, the refuse being boiled for at least an hour; the solution could then be filtered as hot as possible through muslin or calico, and the filtrate evaporated to obtain the extract in a concentrated condition for export."

In advising the manufacture of tea prunings for the China market, of the feasibility of which a trial consignment would be the only test, Mr. Christy advocates what is certainly a very novel idea. There is more than a spice of humour in the suggestion, what a capital cartoon could be based on the motif! Without going quite as far as China, I believe there is not the slightest doubt that we could find a ready and huge market in India itself for the green stripplings of tea prunings.

Many of our readers, we know, will wonder at the "russ" we are making about such an altogether (to their eyes) insignificant matter. Yet surely it must be within the ken of the most casual of our critics, that many a great industry now flourishing is based on the scientific utilization of what had been for generations before condemned as an utterly useless waste product.

the "Ceylon Times" on the Nilgiris.

Advise Nilgiri tea-planters to keep up a little more with the time, and though meant in a very spiteful way, there is a great deal of truth in what a late visitor to the district has said of it. According to him, gleefully says the *Times* of Ceylon, the planters are 15 years behind the times in tea-growing. They look, he says, on a man who has a little Giant roller and an old T. Sirocco as a "plunger" in machinery, and they have a most insufferable arrogance in regard to tea matters, imagining themselves to be wonderful people in the art of tea-making. Perhaps the best indication of the deplorable ignorance of the Nilgherry planters is furnished in the following remark in our correspondent's note:—"The estates are very scattered and isolated, and each man has a hobby, which is ventilated in the papers, quotations from the *Tropical Agriculturist* being final"!!!!

the movement of the trade.

direct to other countries than England. Though on the other hand the yearly increase to the mother country is far greater than that to other lands, showing the urgent necessity of straining all our powers to extending our markets. From April to January 31st this year, shipments from Calcutta to London show an increase, nearly, of 17 million pounds over those of 1895, while the increase for the similar period to other countries is under 5 millions. But the percentage in the former case comes to about 16% against over 62% in the latter, so the ratio of increase is comparably greater in the case of foreign markets. While on this subject it is worthy to note that though we have already practically captured the small *Black* tea trade in America, there is being experienced a great difficulty in risking the *Green* tea so largely consumed.

There is a great deal of sense in the suggestions made by a Ceylon contemporary that we should now devote the major portion of our energies to Russia, where the prospects of increasing our trade are a great deal better.

Home prices.

The quantity offered, says the *Produce Markets Review* of the 6th February, has been fairly large, but as there is a decided improvement in the demand, prices show no change of importance. There has again been a good proportion of the better-class Teas offered, mainly from the Assam district, and these have been readily bought at quite last week's rates. Most of these growths are of exceptionally good quality and strength, and so long as these characteristics are maintained they will continue to be well competed for, especially as the supply will probably diminish, as is usually the case at the end of the season. The Medium Leaf descriptions have not appreciably changed in value, and although there is not such a good selection of these grades as was offered at the latter end of last year, they are still comparatively cheap, and a fairly large business has been transacted in them. Similar grades of Broken Leaf are in excessive supply and meet with but a moderate inquiry at the low prices ruling, and it is evident that these kinds are not being used for blending purposes so freely as was formerly the case. For the commoner descriptions the demand is active, particularly for the more useful sorts, but as the quantity is ample to meet requirements, prices are unchanged. The following are the figures for the past month, compared with January last year:—The imports were 14,095,000 lbs., against 12,414,000 lbs., while the deliveries are about on a par, being 12,136,000 lbs. and 12,141,000 lbs. respectively, and the stock is 56,103,000 lbs., or 2,400,000 lbs. larger. Of the 42,000 packages brought forward at the public sales 38,266 were sold, and most grades were well competed for at steady rates.

The following figures are from Messrs. Stenning, Inskipp and Co.'s Indian and Ceylon Tea Market Review for 1896:—

HOME CONSUMPTION OF INDIAN, CEYLON, AND CHINA.

	Indian.	Ceylon.	China, all kinds.	Total.	Percentage of Indian.	Percentage of Ceylon.	Percentage of Indian and Ceylon.
1896	120,346,000	71,209,000	23,056,000	220,611,000	54½	35	89½
1895	111,174,000	71,544,000	30,663,000	213,381,000	52	33½	85½
1894	113,926,000	69,057,000	24,548,000	207,531,000	55	33½	88½
1893	103,136,000	62,721,000	34,105,000	202,962,000	52½	31	83½
1892	107,557,000	63,044,000	32,332,000	202,933,000	53	31	84
1891	97,855,000	51,393,000	50,817,000	200,065,000	49	25½	74½
1890	100,221,000	36,221,000	57,319,000	193,761,000	51½	18½	70½
1889	98,955,000	30,166,000	64,014,000	193,135,000	51½	15½	66½
1888	87,210,000	18,551,000	78,574,000	184,337,000	47½	10	51½
1887	83,112,000	9,942,000	87,553,000	180,607,000	46	5½	51½
1886	68,421,000	6,244,000	100,000,000	174,665,000	39½	3½	42½

MANURING IN CEYLON.

THE following is an interesting *précis* of correspondence on this subject, taken from the *Ceylon Observer*:—

Bulky manures continue to be regarded as the great desideratum

for tea by most writers: and none are able to anticipate freer use of cattle manure than at present. The manure at present in use comes from bungalow and milch cattle; and, on estates which border the high road or are situated in close proximity to it, from the bazaars and road-side cattle sheds. Cattle establishments would necessitate grass reserves; and the prevailing opinion is that land would be better utilized if planted up with tea or quick-growing fuel and timber trees. In these circumstances, artificial manures—chiefly bones and castor-cake, as in the earlier letters—and the results of their application, form the subject of comment in most letters. The general result is satisfactory. "1897," recognising the fact that "played-out coffee estates" account very largely for the acreage under tea, is emphatic in the opinion that, "if we wish to make ends meet, we must manure," though he would rather avoid manuring, if possible. The same writer suggests as the explanation of the better averages which Indian teas fetch, that the estates on the neighbouring continent have been chiefly opened on virgin soil, and adopt a different system of pruning, while they do not pluck all the year round. That is a point on which more light is required; for we do not despair of better prices with greater care in plucking and manufacture. "O. C.'s" unpleasant experience with Kandy refuse is noteworthy; but was the "incidental defunction" of his plants due to the quality of the muck, or to its quantity? It is well-known that there may be too much, even of a good thing. It is interesting to learn that careful records are kept on New Peradeniya; which is described as one of the most methodically manured estates in the Central Province, and that cattle manure comes an easy first—doubling the yield, against an increase of only one-third from the best artificial manure. That, we suppose, is explained by the character of the soil. On the other hand, "Oram" from Dikoya, backs artificial manures for quicker returns, and superiority in every way to bulky applications. The difference in the soil under the notice of the two writers probably accounts for their apparently incompatible views; but it is satisfactory to know that the systematic application of castor and bones for 8 or 9 years, has led to no untoward results, that the bushes look improved, that the yield has improved at least 200 lb. per acre, and that cessation of manuring for four years has not thrown the bushes back. A. F. S. from Kotmale reports more lasting effects from cattle manure, while artificial yields quicker returns: and his suggestion that, if it were possible, the two kinds should be applied turn about, is worthy of attention. Manuring at intervals of 2 or 3 years seems to find most favour, and it is a great point that manured tea feels the effect of drought less than unmanured. The testimony of A. F. S. runs directly counter to that of "A Novice" in the second batch of letters, as he reports not only no deterioration in the quality of tea, but even a slight improvement after manuring; but surely, the dictum that it would not pay to manure fields yielding less than 250 lb. per acre, needs qualification. We should think that generally these would require special attention, unless they are hopelessly bad.

The general conclusions above-noted are supported by our correspondent from Bogawantalawa, who reports increased yield and stronger growth of wood as a result of careful application of artificial manures; by W. B. J. from Agrapatana, who distinctly denies any deterioration in quality or flavour, while the yield has been increased two fold by systematic manuring extending over 5 or 6 years; and by "A Believer in Muck for Tea" from Kotagalla, and "All for Cultivation" from Rangalla who, as his *nom de plume* implies, believes in naught but good from manuring. "Proprietor" from Kellebokka, on the other hand, fails to see where the profits are to come from at present prices by the application of artificial, but he himself has obtained the best results by the use of cattle manure, line sweepings and coffee pulp regularly collected in manure heaps. "Oya" favours manuring at intervals of 2 or 3 years, and pronounces distinctly in favour of the appearance of manured fields; "Farmer" from Dimbula supports this opinion, and speaks of altogether beneficial results from manuring, "especially from poorish looking tea"—thus running counter to A. F. S.'s lack of faith—while he would think twice before applying artificial manures to really fine, well-bearing fields. K. T. B. from Kalutara counsels caution in the use of manures having a forcing tendency, in which we agree with him; but surely, it is not merely love of dividends which would take steps against a "falling back in yield." If decreasing crops mean lessened vitality,

science and true wisdom alike would suggest the supply of adequate plant food to arrest decay.

PRUNING.

WE extract the following practical hints from the *Indian Planters' Gazette*:—

You justly remark that most of us are afraid of writing to the papers because of possible adverse criticism, but this is exactly what is wanted, for without it there can be no interchange of thought. Thus thinking, I take up my pen to give my crude ideas on pruning.

I must premise that I am a bit of a fanatic on the subject, looking upon it as the most important work of the season, and the one on which everything depends for both quantity and quality.

Pruning, the dictionaries tell us, is the dressing or trimming of trees or shrubs to improve their growth. The difference between pruning at home and out here, being, that generally in the former case the purpose is for blossom and fruit, and on a tea garden for leaf. I came out long enough ago to see the bushes treated to a dressing with garden shears for all the world as if they were to be made into peacocks and menageries of the old-fashioned gardens. The more forward planter used a *dhao*, something like the machete of the West Indian. As time went on, however, it was recognised that careless pruning made decreasing yields, and knotty, spraying bushes, and gradually the old methods were discarded, till now, fancy, on the majority of gardens, small knives are used and knots carefully pruned out.

There are many who still use a murderous-looking weapon, more like a billhook than a pruning knife, both for light and heavy pruning, but I think there is little doubt that the yield of their gardens would be increased by the introduction of small knives and careful pruning.

To begin, taking my own experience in three districts with new and old cultivation, and in a fourth with old cultivation only.

I have left the plants to grow till three feet high, and then plucked all above that height, and then the season after that pruned them down below every branch, in no case leaving more than 10 inches above the ground. The plucking over the 3 feet tends to thicken out the stem and strengthen the roots; while the cutting down so low forces the plant to throw up a number of stems from its roots, while these are young; later on they will not sprout so readily.

The next year it will be found that there is already some breadth on the bush, and cutting 6 or 9 inches above the first year's cut and leaving 3 inches of new growth in succeeding years, the bushes will both grow and yield well. I have always found those cut down lowest in the first year make the best bushes in the end. Being by habit a tree, the most of the strength goes to the original stem if left long.

The style of pruning must be supplemented by very careful plucking at the beginning of the season, so that in the 3 inch new wood left there will not be a "plucking knot," this being the fatal thing to leave in a bush.

Now all this looks very simple, and the men using big knives and slashing across the bushes at a particular height for all of them will argue that they cannot go wrong if they use a measuring stick and cut to that every year, but not being great little tin gods, we cannot insist on each bush growing to order, nor can we be absolutely certain that every one has been correctly plucked, neither can we be sure that in the slashing a little too much or a good deal too little wood may be cut.

Year by year the bushes alter their character, though apparently having the same treatment. Now comes in the necessity for small knives and discriminating pruning.

This pruning can best be done by the women, and indeed they have the most interest in it as soon as they are got to understand that on their good work depends the amount of leaf got in the season. On my garden I have certain lines called by certain women's names that have been pruned badly by those women. These lines are kept as "buisis" for them in the plucking season, and they don't like it at all.

The aim of the light pruning is to leave only straight wood, and no

much of that, taking out *all* plucking knots and crow's feet small *banjis* inside may be left alone; if they are taken out, the trees will be just as full of them the next season, showing that the strength of the bush has been wasted in re-forming it, and besides they form a protection to the bark from the sun. It should the leaves be taken off as they (with the small *banjis*) are the lungs of the plant, and stripping the bush only renders it more liable to disease. Pruning and plucking give little enough, without any necessity for emphasising them.

The only argument I have heard advanced in favour of big knives (light pruning), and slashing, is cheapness, but, working it out exactly, the extra cost of careful pruning with small knives, on a large garden only amounts to from Rs. 500 to Rs. 700, part of which is saved in the initial cost of knives.

It is a simple sum to make out how small an increase in yield would cover this extra cost. The best knife for this kind of work is short straight or slightly curved blade, say $2\frac{1}{2}$ to 3 inches (or 6 inches) in length, with a slightly bent handle say $3\frac{1}{2}$ or 4 inches long. In the hand of an Englishman will go through almost anything, but for natives, especially women, who will *not* hold the knife at right angles to their arms, and the wrist stiff and always try to cut as if it were *dhan*, the hooked knife, like the Kaiser-i-hind, number three, is as good as one could get, but the handle should be shorter.

Bushes, unfortunately, have sometimes to be cut down, chiefly because of one or two eventualities, *i.e.* either because they are getting too big, or have been carelessly treated. For this, of course, big knives are necessary, and frequently saws. In this work the mistake most frequently made is in not cutting down low enough. The bushes have been carefully pruned for years, but should the pruning have been carelessly done it may be necessary to cut low, or quite level with the ground. It's either kill or cure, but the garden must be in a very bad state before this is necessary. I see it stated that cutting down injures both quantity and quality. I have never found it interfere with the former and other men have told me that they have experimented and not found it interfere with the latter. On this head I have no personal knowledge.

While speaking of cutting down, I may quote Mr. McMeekin, "If a bush really needs clearing out, it should be cut down."

The above remarks apply to all kinds, and China, indigenous, requires the same but lighter treatment all round, *i.e.*, always giving more wood.

To sum up, good pruning means *intelligent* pruning, *i.e.*, taking out all plucking knots, bad or diseased wood, and crow's feet. But the works on a garden fit in like parts of machinery, and good pruning is worthless if not followed by careful plucking and good cultivation.

A volume might be written on this subject, but I feel I have already been rather longwinded.

It's really wonderful how quickly the natives will learn about the good and bad points of growing, if one will only take the trouble of going round and pointing out bushes that have been spoilt by being cut just above or on the knots.

One thing remains to be noticed, the time for pruning. The tendency of late years has been to begin early and get it over as soon as possible. One reason for this is doubtless the desire to get the best of the market; another that some gardens get so heavily lighted towards the end of the season, that the Manager tries to make up for it at the beginning; while yet a third may be that the cold weather works must be pushed on." In my opinion, starting to prune directly plucking is stopped, without giving the bushes a rest, is distinctly prejudicial to their health. In fact, year after year I have noticed that gardens where pruning has been commenced the earliest, are invariably the worst blighted, and I can give more than one case where in badly blighted gardens, late pruning was found to be beneficial, nor have I been able to find that the earliest pruned gardens give the best yield; quite the reverse. On under-pruned gardens it may be an absolute necessity to begin pruning early, but my idea is, and always has been, that a Manager should so arrange his pruning that, with all his labour available for that work at the time, his garden should be finished by the third week in February; under pressure I have finished earlier in some years, but with no good effects.

Planters' Library.

Please note that purchasers will effect a saving by sending a M. O. or stamps for the price of the books, plus one anna on the rupee for packing. The value payable commission and registration fees will be saved, while the postage being charged bearing (at the same rates as if prepaid) will ensure safe delivery.

"PLANTING OPINION," COONOOR.

SCIENCE FOR TEA.

MR. CHRISTISON, the well-known Darjeeling planter, if we may make a shrewd guess at the author's name, has been giving the Indian Tea Association in London his views on the aid that applied science might lend to the tea industry. We give the following digest from the full notes given in the *Home and Colonial Mail*. He first says that his remarks are entirely from a practical stand-point:—

Over-cropping.

Under the methods in vogue for the last eighteen years or so, I cannot conceive any general danger to the tea plant from over-cropping. On the contrary, without resort to manuring as generally understood, I am confident that, given labour and ample judicious cultivation, the produce from the present bearing areas in India, as a rule, falls very far short of their safe cropping potentialities, or what were in all cases originally the natural continuous productive capabilities of the soil. I do not venture to say over-cropping is impossible, but with careful, judicious pruning, under the present ideas of plucking for quality as I take them, it would not be easy, and must, I should say, be extremely rare. The tea crop is neither a heavy nor an exhaustive one; and more nitrogen is undoubtedly restored to the soil in the shape of vegetation turned in (or that ought to be turned in) in cultivation, also as derived from the atmosphere, and from the rainfall, than in more temperate climates. The average crop of green leaves taken annually is extremely light compared with the weight of agricultural crops (exclusive of the proportion returned to the soil) in this country. Recent methods are supposed by some to be more of a strain upon the tea plant than the old. But I am of opinion it is otherwise. In cropping for quality, the cutting in pruning is, perhaps, heavier over a majority of the years; but, on the other hand, excessive cutting should be less frequent, and never to the same extent necessary. The pruning, therefore, should not be more exhausting. Plucking for quality necessitates going round the gardens very frequently, leaving the bushes with a constant layer of young shoots and leaves on (as well as the mature leaves) to perform all the functions of the foliage, and is not so trying as the old method of plucking at intervals twice or three times as great, commonly shaving off the flush to the very buds, so to speak. The shock to and strain upon the bushes was greater under the old method, and the temptation to overtax them more where, with an equal labour force, quantity could be more aimed at, the market not being so fastidious to anything but appearance.

There is no doubt that in too many instances the yield of old concerns, notwithstanding considerable extensions, has not increased proportionately, but in some cases may have even fallen off; but this, I believe, due (1), and I trust mainly, to the altered mode of plucking, which has been more and more for quality, (2) to blights, (3) on hill lands, to injudicious, reckless cultivation, and loss of soil from "wash," (4) injudiciously heavy pruning, and, perhaps, (5) not infrequently to greater scarcity of labour than formerly; or to some or all these causes combined.

Blights.

The remedy for blights, of "selection of seed," as I understand to be recommended by Dr. Watt, is worthy of attention. Disease-resisting stock has accomplished something, at least temporarily, in regard to the vine and potato diseases for instance, after long periods of years, but it is problematical not only to what extent, but how long, this may take to benefit tea. At the best the remedy is not a very encouraging one for most proprietors in so far as it can now be of no benefit to the 450,000 acres or so of existing tea throughout India! I am able, however, to testify to having accomplished something by selecting the most vigorous and most likely to be disease-resisting seedlings, in the planting out of my company's modern extensions.

Red Spider.

In regard to red spider I have had at least fifteen years of sad experience in battling

against it. The soil of the gardens I managed seemed predispose to this blight and favourable to its propagation, and I could not imagine any gardens to be worse with it than they were for years. From 1880 to 1885 this pest was in fact a dreadful scourge; but it has been practically overcome by sulphur. I learn that Dr. Watt has no belief in the cure of blight by any application in that way, but after having applied sulphur in quantities of from three to twenty tons annually since 1880, the effectual cure of red spider, at moderate cost per acre, is with me no longer a matter of opinion, but something that has in my own experience been successfully achieved. It has also to be taken into account that the sulphur not only proves a remedy for the red spider, but for many soils a valuable manure.

The article referred to, entitled "Sulphur as a Cure for Red Spider in Tea," appeared in No. 12 of Vol. I.

Other Blights.

I am not, however, so hopeful of the eradication of mosquito blight by any similar application, because (1) the insect is winged and migratory, and (2) the blight is at its worst, and the remedy would have to be applied, at the season of the year when quality should be at its best. The study of the life history of this insect by several scientists does not seem to have afforded any clue as to a remedy. Some hold the opinion that the prevention of jungle fires by the Forest Department led to the increase of the pest on the gardens in the Terai. Be this as it may, it is not impossible that, like some other crop pests, it might be effectually treated in some intermediary stage in its haunts away from the tea plant.

I have no experience of the white ant, beyond what little I have seen of its ravages when on visits to Assam and Cachar.

There are many other parasites and blights, but those I am familiar with do little harm, are amenable to treatment and easily kept in subjection, or do not spread. One of these more frequently alluded to of late, a white-thread fungus, I have seen a little of, and noticed making its appearance in different parts of the Dooars during my last trip to that district in 1893. I am inclined to attribute this pest to defective preparation of the ground prior to planting, dampness of soil, or excess of shade.

Undoubtedly a great safeguard against the ravages of parasites and blights is to maintain the plants in a healthy and vigorous condition. Still I believe that, wherever there is a large area under any crop, irrespective of the exhaustion of the plants, blights in some measure are sure to follow in time. But it stands to reason that with ill-conditioned plants—from whatever cause—blights must prove the more disastrous.

Manuring.

In most instances all that is practicable over wide areas is "green manuring," and, as material and labour admit, top-dressing with leaf mould, such soil as is available, or leaves and twigs. Upon soil of fair quality, yielding crops of the average present day amount, I am not of opinion that for the permanent rude growth and health of the plants more is necessary. But beyond this the great desideratum would be to be enabled to manure for quality. This can never be accomplished successfully or profitably until it be ascertained what elements are lacking for quality in different soils. In this direction, as far as I am aware, no progress whatever has yet been made. It is the province of the agricultural chemist to investigate this, and place practical planters in a position to supply the elements wanting for quality in each case. Nothing can be of more vital importance to the tea industry generally than such discoveries. Nitrogen may mainly be supplied by "green manuring," but the mineral elements (which I believe will be found essential for quality) must I fear be provided or replenished, principally by means of artificial manures. Nitrogen supplied by "green manuring" will doubtless also render some of the dormant mineral constituents in the soil available for plant food. I am not, however, hopeful of artificial manures ever being profitably applied to the tea plant unless for the production of quality.

"Green Manuring." "Green manuring" has very much to recommend it. I have practised this to great advantage, without the aid of leguminous plants specially cultivated for the purpose, and most extensively (prior to 1877) before the extensive introduction of machinery, when a large force of strong coolies were freed from manufacture, and otherwise available in the Darjeeling

g district, during October and November. As in much else, I d hardly say, results mainly depend upon the time and manner in ich the operations are performed.

hen follow a few desultory remarks on Legumes, which we omit, as Mr. Christison has nothing to say that has not already appeared in these columns.—Ed., P. O.]

Cultivation. To most it will indeed be something novel to hear of tea gardens actually suffering from being kept over clear of weeds! We have heard of gardens in ylon being kept perfectly clear at all times by hand-weeding, but am confident that in India such supererogation must be extremely re. The extreme of cultivation with us may be taken to amount eight or nine forkings or hoeings during the year—that is once in ter, and once a month during spring, summer, and autumn. In is way, I should say, there will be more vegetation turned into the l than by only turning it in once, twice, or thrice a year. In the rmer case the harm is more likely to be done by turning over and oaching" the soil in very wet weather. Wet cultivation is sure aggrivate and may even induce blight. When high cultivation aimed at, a great drawback is, the hoeing must be done not vays in the weather most favourable for it, but when labour is ailable. It would be safer and preferable as a rule, therefore, to ltivate a sward of the low-growing leguminous plants to fertilise e soil, and at all times eschew hoeing or forking in really wet ather.

Scientific Officer. As I have for thirty-five years followed the progress of agricultural scientific research to e best of my opportunities, and, since it has been mooted, taken a en interest in the proposed appointment of a scientific officer for e tea industry, I may be permitted to make a few remarks on so portant a subject.

From all I have learned previously, the proposed expert was to be pointed mainly to make a scientific investigation into the pro- cesses of manufacture and ascertain the deficiencies or otherwise of rious soils and their needs in the form of manure. This has vays been held out as the pressing necessity, and I believe wisely For such investigations a thorough knowledge of analytical emistry, and as far as possible also of bacteriology, is indispens- le, and some experience of practical agriculture and plant life ould, of course, likewise be advantageous. The great tea industry ight undoubtedly to employ such a scientific officer, and *perma- ntly*. These qualifications (or almost similar), and also "a know- dge of the chemistry of plant life," have been recommended by r. Watt formerly. If a second expert be really in contemplation r blights specially, then one with "a thorough training in agricul- re" (but better a horticulturist, I should say) "who has examined to the diseases of plants" might be suitable, no doubt. Such a an as the late Mr. Thomson, viticulturist, of Clovenfords, or of the cottish head gardener type (such as I had the privilege of consult- g about red spider blight in 1877-78), men of valuable practical perience and great intelligence and sagacity would be of vast enefit for blights if the industry could secure their services for a w years. Or from such in conjunction with a competent agricul- ral chemist the best results might be expected.

I am not of opinion that there is much need of an expert specially r blights. All that is required are observant, thoughtful, practical en, methodical, with a scientific cast of mind, and withal, and ove all, enthusiastic. It must be admitted that most gardeners nd agriculturists sent out to tea commence perhaps with too little me experience for this task; still I doubt not there are now veral men connected with tea in India, if set aside to devote their ntire time and thought to the matter, would be able in time to eomplish much. In addition to the agricultural chemist one such ight even be deputed to each group of blighted districts.

There is, I learn, no hope held out of pecuniary aid from Govern- ent. Upon the whole, this may not really be a disadvantage, ecause Government support would reasonably be accompanied by overnment control. If there can be absolute certainty about any- ing regarding this appointment it is this: The Tea Association ould engage the most competent and suitable scientific officer urable, and if such be secured, there is no one in India I have ard of competent to "supervise his work." He should only be nder the direction of sound business men financially, and must

be allowed a free hand in regard to his scientific investigations, being at the same time led clearly and fully to understand that the success of his efforts to benefit the tea industry shall be to his own advantage and *vice versa*. But the Association must not be too impatient of results. No one can doubt that the scientific officer will always be very glad to receive suggestions and information from any one Government may depute, for the good of the industry to interest himself in and furnish information bearing upon the investigations. But, depend upon it, the control or supervision of the scientific researches of a competent officer, as suggested, could hardly fail to mar the efficiency of, if not wreck the under- taking.

Neither can I agree that the use of the Government laboratories would be advantageous as a rule. The scientific officer must have his own laboratories, though only a small bungalow or part of one. It would be impossible, for instance, to obtain any reliable results in the chemical investigation of the process of manufacture unless the laboratories be close at hand. Government would no doubt place their laboratories and apparatus at the disposal of the scientific officer if necessary for any special investigation.

In regard to a suitable "scientific officer," laboratory accommoda- tion, apparatus, and instructions to be framed to insure continuity of research in the event of inevitable changes, I believe the Association could not do better than consult Dr. John Augustus Voelcker (Ph.D., B.Sc., &c.), consulting chemist to the Royal Agricultural Society of England, who devoted thirteen months throughout India to an inquiry into its agriculture (mainly in its scientific bear- ings), and the qualifications, equipment, and appointment of agricul- tural chemists for the country.

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

Cleanliness in the kitchen. The great question of the day is, without doubt, cleanliness and sanitation, and in no place is it of more importance than in the

kitchen. I remember reading in a paper some few months ago of a lady describing our Indian kitchens as "reeking gipsy-holes;" now, without going quite so far as this, I quite agree with her that there is room for much improvement in the ordinary Indian kitchen. It is a common practice among a great—a very great—number of housekeepers to pay a visit to their kitchens once a week, and they consider their duty in that respect faithfully carried out. Many times have I heard ladies who consider themselves model housekeepers say, "oh yes! I am most particular that the kitchen should be kept perfectly clean and tidy, and the cook knows that every Monday morning at 10 o'clock I shall come into the kitchen and expect to find everything spotlessly clean." This of course is all very well in its way, and you are assured that once a week all things are cleaned, but how about the six other days in the week, when your cook is not expecting you to inspect his pots and pans, can you be sure they are always in the perfect state in which you find them at 10 o'clock on Monday morning when he is expecting you? No, I fancy not; I think myself it is better not to have any fixed day or hour in which to visit your kitchen. My own plan is to go in when my fancy leads me there and expect to find the place and utensils always clean, except of course those which are in use at the time; if cooking is going on, you then have a splendid opportunity of seeing if the food is being prepared in a cleanly manner. If, however, you are determined that things should be well and cleanly cooked, you must yourself be sure that your part towards the kitchen is performed, viz., that

A kitchen as it should be. there is plenty of light and air, and if it is not convenient to have a sufficiency of light from

the windows, have two or three sky-lights fixed in the roof, which will make a vast difference in the lighting of the place. Shelves should also be put up for saucepans, frypans, coffee roaster, etc., to stand on, and under this a row of nails should be arranged on which to hang the bright covers of the saucepans. Another shelf or shelves should be put up for bright cake, jelly, and soufflé tins and moulds, sausage machine and coffee grinding machine (both quite indispensable in a well-regulated kitchen) could also stand here. There should also be preparing, pastry, and dishing up tables

provided. If the ordinary open fireplaces are used, have an arch of brick-work built over them, and a chimney to carry up all the smoke; this makes a vast difference in the cleanliness of the kitchen, but to those who can afford to spend a little money over their kitchen, I would most certainly advise them to purchase a stove; there is no doubt a stove is a great advantage in saving work, as the fire serves to cook the whole meal, consequently there is not the trouble in keeping up the half dozen fires generally used, and the cook is more free to devote his time to keeping the kitchen clean and tidy. The floor should be of asphalt or cement, which is easily cleaned. When you have once arranged all the things as described, all that is needed to keep it sweet and in nice order is a coat of white-wash two or three times a year. Now I have a word or two to say about the saucepans; if expense is no object, nothing will be found better than seamless steel; however, I think in most cases the enamelled ware will be found most excellent and is so easily kept in order. I do not advise copper vessels, though I know they are much used, yet there is always the fear of poison, if they are not kept in thorough order. The following is an excellent way of cleaning copper vessels.

To clean copper vessels.

Soft-soap and rottenstone, made into a stiff paste with water, and dissolved by gently simmering in a water both keep on with a woollen rag, and polish with dry whiting and rottenstone. Finish with a leather and dry whiting.

A washing up room.

Washing up dishes should never be allowed in the kitchen, it is better to have a small room outside for this purpose, by the side of the kitchen if possible. We will suppose there is a window on one side of the room, and under this a masonry sink should be built and cemented over; a hole should be made for the water to run through, and covered with a piece of perforated zinc to prevent any pieces from getting into the hole and blocking it up; the water should then be allowed to run through into a drain outside and well flushed every day. The actual sink should be about 2 feet 6 inch in height and 3 feet in length, and a solid piece of masonry on either side about 18" x 18"; the top of this should be cemented over and serves for a table; one side for putting the dirty things and the other for putting the things to drain as they are washed; there should also be a rack for draining the plates in after washing them, and this might be fixed on the wall at the right hand side of the sink.

Be careful with gelatine.

I would warn my readers to be particularly careful in making and cooling all puddings in which gelatine is one of the ingredients. It is a well-known fact that medical men when they want to secure minute organisms for investigation expose gelatine to the air, or where germs are, and it quickly attracts and holds them. But on this account we need not forego our creams and jellies, as on medical authority we are assured, that if they are covered, if only with clean muslin, they are quite safe.

To make coffee.

The following recipe, which has been recently sent to me, for making coffee will be found worthy of trial:

You will make your brew for to-morrow this evening, and this is how you will do it. First warm your jug, then measure out your coffee, and to each tablespoonful of coffee allow one cupful of boiling water. Fold a clean cloth to several thicknesses, place it over the jug, and leave it standing all night. The next morning strain it off through a cloth into a clean jug, from thence into a bottle and cork it.

You will have clear strong coffee, available at any moment by the simple process of heating, but remember that with regard to the heating you do not on any account let it boil.

Legacy Pudding.

Put 2 tablespoonfuls of Lard into
5 " Flour
3 " Sugar
1 " Baking Powder
 $\frac{1}{2}$ lb. of raisins, 2 eggs, 1 cup of milk,
mix well, and bake 20 minutes. Serve either hot or cold.

Sardine Fritters.

Drain the sardines thoroughly from the oil, season well with cayenne pepper on the inside, opening them most carefully with a knife and then closing them again. Then dip in butter, and fry 5 minutes in boiling fat. They should be a delicate brown when drained from the pan.

THE NUGGET OF GOLD ORE.

"THAT," said my friend, in reply to a question of mine, "is a very large and very rich nugget of gold ore. It was taken many years ago from a mine in Australia."

"How much is it worth?" I asked.

He looked at me with a shrewd smile and replied: "It is worth just nothing at all."

I thought that a queer thing for him to say, but asked no more questions.

Two years later I again visited his house in London, and this time I missed the big nugget from the shelf where I had first seen it. But I asked no questions. Perhaps, recalling the incident of two years before, my friend said: "I have something to show you, and, opening a closet, he produced a magnificent gold vase, remarking: "That nugget of gold ore has taken this form. Exclusive of the labour involved in the transformation, the gold alone is now worth £100."

What curious similitudes there are between things essentially unlike! Here is one which it may be instructive to follow up. It is suggested by the following sentence from a woman's letter:—"In spite of all the nourishing food I took nothing seemed to give me strength."

Now, why was that? Perhaps the history of the previous three years of her life may help to account for it. In January, 1890, she had an attack of influenza which, she says, left her low, weak, and languid. So far as we are able to ascertain, influenza is caused by a certain poison in the blood developed during peculiar conditions of the atmosphere. Its early symptoms are those of a fever; they are always sudden and often alarming. Yet, as in nearly all cases it ends in recovery in a week or two, it does not explain the mystery of Mrs. Westall's continued weakness and prostration.

She tells us that her appetite was poor, and that eating was immediately followed by great pain in the chest, back, and sides. Hoping to overcome this state of things she took much nourishing food. That an increase of strength should result from the eating of plenty of good food would seem reasonable. How else can one ever gain strength? Yet, strange to say, no such result followed. On the contrary, the pains became worse, so that—to use her own words—she was "completely racked with pain" all over her, and so weak she could scarcely put one foot before the other. Besides this the condition of the stomach was far from encouraging. That organ is the source of all power in the human body, and should feel warm, comfortable and quiet. In this lady's case it was full of uneasiness and pain. She speaks of a craving, gnawing, sinking sensation in it, which was not relieved either by food or by any medical treatment. Certainly, something quite different from a former attack of influenza went to the making of that; we must look deeper to find the real trouble.

Chemists often determine the character of a poison by observing the colour it creates when applied to litmus paper; and—in addition to the general symptoms—it is sometimes possible to tell the nature of a disease by taking notice of what cures it. Now there is one universally known remedy which never fails to cure one subtle, comprehensive, and yet deceptive disease. Happily it was finally employed in Mrs. Westall's case.

In concluding her letter, dated December 1st, 12, Rucklidge Avenue, Willesden, London, N. W., 1892—she says: "At the time when my condition was very critical and my family very anxious, my son-in-law, Mr. Deacon, of Shepherd's Bush Road, told me how, in an illness of his own, he had been cured by Mother Seigel's Curative Syrup and advised me to begin using it at once. I did so, and soon my appetite returned and my food digested; and by the time I had consumed two bottles I was strong as ever, and have kept in the best of health ever since.—(Signed) Yours truly, Mary Westall."

This remedy, as the public is well aware, is advertised to cure indigestion and dyspepsia and its consequences—and nothing else. Yet these consequences include nearly every ailment with which we are familiar. Even influenza seldom attacks any save those whose blood is first poisoned by indigestion and dyspepsia.

And as to that nugget of gold ore? Ah, yes.—Gold is worthless until it is manufactured. Food is useless unless it is digested. Between the ore and the vase is the workman. Between food and strength also a workman—the stomach.

MARKET SUPPLEMENT.

SATURDAY, MARCH 6, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (February 12, 1897)
rs.—A very firm tone has prevailed at Public Sale this week, and all
scriptions of new crop coffee have met a strong demand and realized
extreme rates.

About 1,200 bags East India were offered and attracted keen competi-
n, the bold colory qualities being disposed of at phenomenal values.

Firm prices were also obtained for the superior grades of Costa Rica
Columbian, whilst the commoner kinds sold readily at previous rates.

In consequence of the continuance of the heavy receipts Futures have
n rather easier during the week, and at the close quotations show a fall
1/- to 2/- since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week
ing February 10th, 1897, says:—Bank rate 3%. Bombay Exchange
ses at 1s 3½d. Brazil Exchange 8½d. Rupee paper 3½% 62½. Silver
1½d per oz.

A good demand continues to prevail at auctions, and prices are
ly maintained for the ordinary kinds, whilst fine colory and middling
e dearer. The first few consignments of new crop Coorg and Mysore
alized very extreme rates. The news from almost all parts of India
int to a considerable reduction of the previous estimates, and the total
old this year will not probably be more than about half last year's.

According to Messrs. Duuring & Zoon the European stocks on the 1st
t. showed an increase of 7,950 tons, and the visible supply a decrease
3,980 tons, the figures being 106,700 tons and 235,080 tons respectively,
ainst 98,750 tons and 239,060 tons on the 1st January, 1897.

Daily receipts have averaged 7,857 bags in Rio, and 10,000 bags in
antos.

Futures continue quiet, and a decline of 3d to 9d has occurred, viz.:—
od average Santos in Havre, March delivery closes at fcs. 62.00, in
mburg pf. 50½, and No. 7 low ordinary Rio in New York \$9.20.

To-day's London official quotations are:—

15,250 " CEYLON } auction this week.
2,191 " JAVA }

The progress made in the use of Indian and Ceylon Tea in North America is very encouraging. A steadily increasing quantity has been taken during many years back.

The advance made in 1895 was considerable, and it is therefore the more satisfactory to find that the 1896 figures show a still further important increase.

No account has been taken of direct imports from India and Ceylon except those *via* China, as it is difficult to say with accuracy how much is included in the transshipments *via* United Kingdom.

Ceylon. A very small sale took place this week, and consequently the Teas met with strong demand and competition was good, the market being steady throughout. The official estimate of the Ceylon crop for 1897 is 117½ million pounds. The following averages may be mentioned:—"S T Co. St. Leonards," 1/1½; "Campion," 1/-. Av. for week rather over 8d. agst. 8½d. for same period last year.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, MARCH 20, 1897.

[No. 6.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the end April 1897.

Travancore. 15th March.—*Weather*.—Very hot, otherwise fine. *Rainfall*.—This month 8. Total since 1st January 3'83". *Crops*.—Tea flashing splendidly. *Plant-diseases*.—Nil. *Health*.—Fever commenced. *Labour*.—Fairly plentiful.

Nilgiris. YEDAHALLI.—Not much rain fell here in February, most 37 cent. gauged on one estate; so no harm was done. Blossom very forward, as it is generally throughout the district. Sea-breeze began earlier than usual this year, and blows rather too strongly between 3 and 7 P.M. Days clear and hot. Ragi 16 seers, rice 11 seers.

Nellampathy. *Weather*.—No more rain since last I wrote, but the last week or so the mornings have been very cloudy. *Plant-diseases*.—Very little "leaf" showing now. *General Health*.—Bad. Fever very plentiful, but

no more cholera reported. *Labour*.—More coolies available than are wanted. *Interesting Items*.—Water now very short.

North Wynaad.

MANANTODDY, 16th March.—*Weather*.—For the first half of March has been pleasant, though thermometer showed a pretty high temperature occasionally during the day-time. Sea-breezes (sometimes strong, P.M.) prevailed and dewy nights followed by mist in the early morning and more or less of clouds thereafter. On 5th, a drizzling shower fell during night. *Crops*.—Pepper being gathered. Coffee all despatched. *General Health*.—Fair, a little fever about. *Grain*.—Ragi 25 and rice 12, large seers per rupee. *Interesting Items*.—No gratis advertisements from North Wynaad for suitable agents to procure lands. That Octopus, the Forest Department, is in a great hurry, apparently, to grasp as much as possible of the splendid heavy forest here before the advent of the expected tea-planter.

S. E. Wynaad.

PUNDALUR, 17th March.—*Weather*.—It is very hot during the day and cool at nights. *Crops*.—Under shade, the blossom that was set doing well and out in the open lingering from want of rain. *Plant-diseases*.—Nil. *General Health*.—Fever prevalent among the coolies. *Labour*.—Ample. Grain is getting slightly dear. *Interesting Items*.—This district has got very good roads communicating with Mysore, Nilambur, Coasts and Ootacamund, and the roads are always kept up by the Local Fund Board. Nilgiri District in good order, and the iron bridges are very strongly put up, and at any time the traffic is carried on without any trouble.

Mysore.

MUDGIRI, KADUR, 16th March.—*Weather*.—Since the small showers of February 17th and 18th, no rain has fallen, and planters have an anxious time, for the rain, though 25—50 cents, brought out blossom on many estates. The second and best blossom is to follow, and rain is wanted badly. A good shower fell around Kadur station on the 14th. *Crops*.—Except on a few estates, crops will not be "bumpers." Leaf-disease has done its damage and spoilt the good wood. *Plant-diseases*.—Leaf-disease has all gone and trees are making new wood. *General Health*.—Good,

few cases of fever about. It is rumoured the Plague has reached Mangalore. *Labour*.—On most estates all coolies have been paid off and sent below Ghauts. *Interesting Items*.—The opening of the Saklaspur Club take place on the 24th, and a volunteer meeting. On the 29th, the volunteers march in stages to Mercara for a sham fight and camp of exercise.

GENERAL NOTES AND ARTICLES.

BUSINESS MANAGEMENT OF ESTATES.

It is said nowadays that the day of the "small planter" is drawing to a close in South India, much in the same way already observed in Upper India and Ceylon. Small estates are sold to large owners or companies, who by means of their larger capital and area under cultivation are able both to work more economically and to withstand with comparative ease a succession of bad years that crushes the small owner. In the good old days when the margin of profit ran high, every planter almost was an independent owner, managing his estate himself, and reaping all the benefits therefrom. But now that profits are smaller and more precarious, the risk and responsibility attendant on the ownership of an estate are such as to deter many from embarking in the venture. The easier and seemingly less precarious mode of obtaining a living as manager or superintendent is preferred, and what savings are accumulated, too few, alas, generally find their way to a bank. The concentration movement in South India is however markedly slower than in the tea districts of Upper India or Ceylon, as the long list of independent proprietors given in our Directory clearly shows. Yet the tendency, though only gradual, has set in unmistakeably, and every year the movement will gather in force and volume.

We would ask our readers if this tendency of "small owners" to relinquish their independence and become hirelings (we use this word in no offensive sense) is inevitable? It is true that the margin of profit is not a wide one nowadays, and that a succession of bad years is apt to strain the financial resources of small owners to the breaking point. Yet on the other hand, the managing owner has a great advantage over the absentee proprietor, be he a private individual or a shareholder in a company. The estate which he works is his own, for every rupee spent he will see that full sixteen annas of work is obtained in return. The welfare of his estate means all the difference between penury and comparative affluence, his whole heart is in his work and all his energy and resources are called upon to forestall or overcome his difficulties. With an absentee proprietor's estate it is different. As long as things go fairly well, the manager has no need to trouble himself, a few more rupees spent is neither here nor there, a fair average is all he looks for as a rule, and with this the owner is, or has to be, content. A change of managers is always possible, but seldom advisable. The managing proprietor should therefore get a much larger profit from his estate than the absentee owner either does or can obtain. Why then has he so often to give up the struggle, and see his estate, on which he has lavished all that his skill or forethought could suggest, lapse into the hands of others?

Is it a series of bad years? Then surely he should, by means of his greater profits, be able to weather the storm as well as his neighbour, who if he has more estates, has

proportionately more calls to meet. The latter has usually it is true, also proportionately more reserve capital, but should not the larger profits of the former counterbalance this? They should, in truth, but for lack of sheer business capacity, it is far otherwise. We come here upon the rock on which so many once prosperous small owners have been wrecked. And yet it is one, which, it would seem, requires a grasp of only the most rudimentary principles of business to avoid with ease.

We will take the case of a man, a trained planter, beginning on his own capital. According to the extent of his capital he either buys an estate already in bearing, or opens out a new one. In the latter case he often makes the usually fatal mistake of opening out more land than he can afford to work; trusting to the first year's crop or mortgage on the clearing to carry him along until the estate is in full bearing, and set him right again. We will suppose that he escapes this difficulty, and finally gets his estate into bearing with sufficient capital to keep it going for a more or less limited period. For a few years he draws a moderate but regular income and has every reason to be content with his lot. Then comes an unhappy bumper, and with it the greatest danger that has yet faced him. Here comes the parting of the ways, and he must finally decide on the principles that are to guide his planting career. Shall he yield to the temptation of enjoying his good fortune to the full, take a trip home and barely leave sufficient money for the following year's expenses? Or shall he wisely bank the major portion of the surplus, and merely enjoy the customary "manager's bonus"? In other words, he must decide whether to live from hand to mouth, and see his income fluctuate with every rise or depression in crops and market, or to be content to regard as his income, only that sum of money which is represented by a fair and safe interest on the capital originally invested. We suppose that fifteen per cent. is the utmost limit of safety in tropical agriculture, it would be wiser far to content oneself with twelve or even ten. Every anna he gets above this amount should be religiously banked to equalize inevitable depressions in succeeding years. If not the end of such a planter is swift and sure. The year succeeding a "bumper" will be a blank one, and with an estate needing more lavish expenditure than before and bare exchequer to furnish its requirements, a second or third bad year sees the estate and its owner part company for good and all.

There is yet another phase of the difficulty, to which great attention was lately paid by the *Times of Ceylon*, with regard to the so-called "reserves" of certain of the local tea-companies. In the case of the companies, after paying a satisfactory dividend from the yearly profits, the surplus is carried to a reserve fund. The manner in which the fund is invested calls for our contemporary's grave censure. Instead of investing in undertakings or institutions, the prosperity of which will not be affected by the fate of the tea-industry, so as to equalize the dividends in bad seasons instead of so doing, we say, these "reserve funds" are locked up in the purchase of further tea properties. The non-wisdom of such a course should be patent to all.

It will become still plainer when we apply it to the case of the planter whose operations we have been commenting on. We will suppose he is canny enough not to spend the "bumper surplus," but yet not wise enough to invest

Coonor.

Tea land, &c.

Tea land at high elevation, also coffee land, for sale, or partnership to open. Particulars to

it altogether outside of his planting interests. He follows instead the example of the companies alluded to before, and locks up his "reserve" in further extending his estate. The result of this proceeding is that his responsibility is increased in direct ratio to the expenditure of his capital, and that consequently, acre for acre, he is just as ill prepared to meet emergencies as his spendthrift neighbor planter who reddens his little universe for a brief time in a gorgeous bumper conflagration. At first sight this is not obvious. He owns a larger estate than the latter, other things being equal, a consequently more valuable property. If he sells at once, he is undoubtedly better off, but if bad years come, as come they must, every extra acre added up forms so many extra calls on his resources. How can he therefore escape the fate that overtook the spendthrift?

Our observations many seem trite to outsiders, but we are specially addressing young planters starting in life on estates of their own. Not a few old ones, too, might appreciably benefit by our advice. To conclude, an estate should be looked upon as an investment, not as a speculation, and to point out how this may be done with the greatest amount of safety, has been the purpose of our remarks.

Some months ago we distributed a few packets of seeds to enquirers. Will the experimenters kindly give us the results of their trials?

A correspondent elsewhere asks for information on the subject of guano in India. In view of the great importance of obtaining nitrogenous and phosphatic manures at a low price, the matter would certainly seem one for the U. P. A. to take up. There must be huge natural deposits of this valuable fertilizer stored up in caves in different parts of the country, and we are sure that Government would gladly supply the planting community all the information concerning them in their power.

The great value of the work the United Association is doing cannot be too often insisted upon. The latest instance of its usefulness is clearly shown in the manner in which the Government of Madras was led to reconsider its decision regarding the extension of its cinchona plantations. We regret we cannot find the space to reproduce the *Madras Mail's* recent articles on the subject. But we may mention that they have conclusively proved it by the logic of the figures supplied by our Planting Member of Council, the Hon'ble Percival Hodgson, to Mr. Standen, Government Quinquina Committee, that the reversal of their previous decision was justified.

We lately addressed Mr. D. Hooper on the subject of the economical use of cinchona and coffee prunings, with especial regard to the manufacture of caffeine. His reply is as follows:

After considering the question as to how far a planter can be engaged in the manufacture of caffeine, my opinion is that beyond drying the powdered leaves he can do nothing. The manufacture of a concentrated preparation either liquid or solid on the estate would be impracticable. The powdered leaves would be less bulky

than the leaves of tea usually packed, and there would be a saving in their freight if exported in such a condition. The grinding of the leaves in a dried state is the first step in the manufacture of the alkaloid and this simple process could be carried out by nibbing the sun-dried leaves through a sieve and rejecting the woody portion of the bushes."

So with freight and packing charges running to 2d. per lb. and the sale price of such powdered prunings not being probably over 3d., the apparent margin of profit is not great. It is a question, however, whether the local manufacturing chemist might not be approached with advantage on this subject.

The Trust Fund.

In our last issue we noted Mr. Acworth's proposal to devote a portion of the U. P. A. Reserve Fund for the purpose of presenting an address and casket to the Queen-Empress. A responsible and well-known Mysore planter, in a letter reproduced in our correspondence columns, expresses his strong objections that the Fund should be used for any such purpose. He proposes instead that a special subscription be collected for the purpose. There is undoubtedly a good deal of reason in this objection, which is one based on the principle that the Fund should be used strictly for the objects for which it was raised. Perhaps the majority of subscribers to the Fund will hold that an address of loyalty and esteem does not constitute an attempt to "advance the interests of the Planting Industry in Southern India," though, as we have already pointed out, anything that brings our Industry into commendable prominence is of distinct, if indirect, benefit generally. We are glad to note that there is no opposition to the presentation of the address itself, and that, after all, is the main thing.

Roads on the Shevaroy.

Shevaroy planters are expressing, as well they may, strong dissatisfaction with the action or rather inaction of Government on the matter of providing roads for this champion little district. The Salem Taluk Board apparently does all it can to deprive the Shevaroy of its proper share in the funds for the construction and repair of new roads. Planters are always or nearly always told that no funds are available; and, even in cases where they are willing to spend their own money, endless delay and trouble are experienced in simply obtaining official sanction to take the work in hand. Owing to the increase in traffic and the large extensions of coffee, an improvement on the present shamefully primitive jungle tracts is absolutely necessary. It has been said that planters are always wishing that Government should do everything for them, but here is a case where planters are willing to provide the funds themselves if only official sanction is accorded, and that sanction is often wilfully and vexatiously withheld. We intend taking up this matter again shortly, and hope the President of the Taluk Board will ere long awake to a proper recognition of his functions.

A hint to Government.

Hitherto the interest that has been attached to Mr. Nelson's now well known advocacy of *E. lithosperma* for manuring purposes, has centred round its value for plantations. Now we learn that he has achieved a yet further success, and one which may have a most important bearing on the question of enriching the impoverished soils of the plains. That orna-

mental and expensively useless institution, the Madras College of Agriculture, might do worse than carry out careful experiments with this natural fertilizer. Mr. Nelson writes:—

"*E. lithosperma* has served afresh a triumph in a new direction, viz., as a manure for paddy. I gave a man a bandy load of *E. l.* loppings on the understanding that he was to use it separately and comparatively with the other green manures they use. He has just reported that he has got an increase of 2 cottahs (12 bus.) of paddy with *E. l.* and the grain is better filled and heavier, the growth of straw being the same in both cases. I expect the increase is due to the large amount of phosphoric acid in *E. l.*, as the small amount of mineral constituents in rice is largely phosphoric acid.

It is a pity, for Mr. Nelson's sake, that he could not retain patent rights on his system of manuring, else he would have had every prospect of retiring as a millionaire in the next few years!

The roots of plants.

A late report of the Kansas Agricultural Department distinguishes two classes of roots in plants, explaining the text by means of an illustration which we regret we are unable to reproduce. The two kinds of roots are (1) the feeding roots which grow along in the true or cultivated soil where the plant food is abundant, and (2) roots which go down deep into the soil in search of water.

"We say search of water as though it were a matter of instinct, but the influence which encourages these roots to take a downward direction is the flow of moisture constantly coming up by capillary attraction from below to the surface.

"The young roots are attracted by the moisture, and grow and go down deeper and deeper. There is a case recorded of a willow which grew to be a large tree in apparently a dry soil, but it was found that there was a small leak in an underground tank, several feet away and deeply below the soil; guided by the moisture which came up through the soil, the roots found it out and formed a large mass of fibrous roots in the tank itself.

"The depth to which some of these moisture-seeking roots will go down is remarkable. One day on Earl Ducie's example farm at Whitefield a party of young men thought they would ascertain how deep wheat roots went down into the subsoil, and one of them held the root in his hand to shield it while the others dug out the earth and gravel to enable them to follow its course. They dug out tons of stuff, which carried their digging down eight feet four inches, and, as they believed, the root was then broken off. Roots of onions have been found nine feet down or more, and could be distinguished by their taste. Where deep cuttings were made across a field of sainfoin for a water-works culvert, the roots of the plant were found twenty feet from the surface, and lucerne roots have been found even deeper; in fact, it is believed they go down to the bed-rock even.

"The habit of grasses, whether deep-rooting, or growing with shallow roots, determines their suitability for this country.

"Now, it is easy to see that a field with a hard and almost impenetrable subsoil, or pan, created by constant shallow ploughing, will not allow of this deep-rooting, and therefore in absence of rain for even a short time, the crops must suffer, while on other lands which have been subsoiled and the impediment of a pan broken up, the crop may

hold out and come to maturity. Besides the advantage of the deep-rooting, the feeding-roots of the plant will find food in the broken-up subsoil when they can be distributed amongst it."

Selangor.

The annual report of the Selangor Planters' Association for 1896 states that 21 new members have joined, and that the total area under cultivation is 4,487 acres, with more labourers. Extensions during 1897 bid fair to pass those of any previous year. The report continues:

"Considerable areas have been opened up in almost every district in the State; but most notably in Klang, where flat low-lying lands have attracted particular attention, where, contrary to what might have been expected, malaria and dysentery, the scourges of this country, are comparatively unknown. An unfortunate reverse was experienced by several proprietors who found large quantities of tin in the land which they had purchased; but the Government having acted with praiseworthy promptitude and liberality in allowing the owners of such land to take fresh holdings elsewhere in exchange, many took advantage of the offer and have started work in more promising localities. The 320 acre block system still finds little favour in the eyes of planters, but surveys have been put through with much greater rapidity, and the land offered at all auction sales has been amply sufficient for buyers to secure what they required without competition.

Regarding the work of the Labour Commission appointed early in 1896, the report complains that the Government has apparently shelved the whole question and proceeds:—

"A mass of evidence was adduced to show that there is a decided feeling in the highest official quarters that the Government should import their own labour from the Straits, and it was urged that emigration to the Straits should be facilitated by the establishment of depôts in a suitable district or districts of the Madras Presidency, and running a subsidised steamer service from Negapatnam to Penang; it was also recommended that a certain percentage of the Circular depriving employers at this end of the right to pay agents for recruiting free—i.e., unindentured—labourers in India should be withdrawn. The latter suggestion has been adopted and a sum of \$1,000 was provided in the Budget of the Colony for the purpose of "Assisting Immigration;" the Native States have contributed nothing at all! It can only be hoped that the Government will yet come forward in some way to relieve the strain, and that the neighbouring Colony of Ceylon, where labour has been imported in the past for Public Works of magnitude, where at the present time the go-ahead Governor, Sir Ridgeway, has declared himself most strongly in favour of the same policy, affords an example which the Government Settlements with its very insufficient supply of labour may well follow."

Jadoo, Limited.

In to-day's issue appears an advertisement from this company offering its shares to the public, which we doubt it will avail itself of the chance. The capital is Rs. £50,000, individual shares being issued at £1 each. Full particulars may be obtained from the Madras agents, Messrs. Parr and Co. To planters of course the question of price is ever

NILGIRI DISTRICT PLANTERS' FAMINE RELIEF FUND.

Famine Fund. This fund has been opened as a branch of the fund started by the United Planters' Association Southern India. Subscriptions (monthly) or donations are earnestly solicited for from all residents in this district. Remittances should be sent to Hon. Secy., Nilgiri Planters' Association, Hon. Mr. H. Percival Hodgkiss, Kullakambay; Henry Wapshare, Esq., Guynd P. O.; L. W. Grey, Esq., Kara; L. C. Liebenrood, Esq., Nellacotta.

E. G. WINDLE,
HON. SEC., N. P. A.

Apl.

Shade Seeds. WANTED Shade Seeds, fresh, of Silver Oak, Albizzia Moluccana and E. Lithosperma.
Apply to
"HAICH," C/o Editor, "Planting Opinion."

Nilgiri Tea Estate. WANTED to lease for a term of years, or buy managing share, in a small tea estate on the Nilgiris.

Apply NILGIRI TEA,
C/o Manager.

Letter Press. WANTED a second-hand screw letter press, in good order. State price delivered at Railway Station to

PRESS,
C/o This Paper.

Medical Practitioner. WANTED.—By the South Travancore Tea Company, Limited, a medical practitioner for the Kalthurthy Valley Hospital and Dispensary. Applicants must hold a diploma of, or equal to, a Madras Hospital Assistant. Apply to MANAGER, T. T. COMPANY, LIMITED,

KALTHURTHY,
Tinnevely District.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better one or in want of a manager, assistant, or writer, &c., is entitled to insert an advertisement to that effect free for as long a period as desired. These advertisements will appear on this page. Non-subscribers will be charged the small fee of one rupee.

To be worked in conjunction with the above, we have established a register, and names will be entered on application, together with copies of their testimonials. Thus should any enquiries be made for the services of a manager, assistant, &c., the names and testimonials will at once be forwarded, saving delay and trouble. Subscribers may have their names entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO.

Writer. Wanted a Writer for Field work only, must have a thorough knowledge of coffee, keep a rough roll, and have a good labour connection. None need apply unless they have the latter. Apply A. MORGAN, Kil Kotagiri, Nilgiris.

English Graduate. An English graduate and the son of a General Officer desires an engagement. Address
No. TEN,
Five. C/o of this Journal.

Field Overseers. Field Overseers from November 1896 in opening new clearing. Salary Rs. 20 to 25 per mensem. Natives only need apply.

Apply to A. H. SHARP, Esq.,
Devikulam.

BILLETS WANTED BY.

Field Writer. WANTED.—A Field Writer for a Tea Estate in a healthy district. Salary Rs. 30/- and Cooly.
u. c. Apply TEA,
C/o Manager, P. O.

European gentleman. WANTED—Employment by a European gentleman of experience, on a Coffee Estate. Willing to start on small salary. Has good knowledge of Tamil, Canarese and Hindustani.
Apply to "EPAMINONDAS,"
Eleven. C/o this Paper.

Manager. WANTED a situation of trust as manager by a European Gentleman with over 10 years' experience in Coffee or Tea. A temporary billet for say 6 months, Rs. 400; permanent Rs. 250 per mensem at first.

Apply F. O. B., C/o Manager.

By young European Planter. WANTED employment as Manager or Superintendent of a Coffee Estate. Five years' practical Experience in South Mysore. Excellent Testimonials. Salary Rs. 150.

Apply E. P. L.,
C/o Editor.

Young Tea Planter. WANTED position of Trust or Assistant on a Tea or Coffee Estate in S. India. Has had two years' experience in Assam. Is willing to work 6 months without a salary till he has learnt local conditions. Good references.

u. c. "A. K.,"
C/o Editor.

Tea or Fruit. WANTED an appointment as Manager or First Assistant in tea or fruit. Ten years' practical experience, well up in the cultivation and manufacture of tea, and also in the management of English fruit trees. Bachelor, age 29, active, hard working, sober habits, excellent testimonials and information from the Manager of this paper. Can join at once.

KUMA.

Coffee Planter. WANTED a situation in Coffee as Superintendent or Manager by a European with over twenty years' experience.

u. c. Apply D.,
C/o Manager.

Superintendent. WANTED a billet as Superintendent of a Coffee Estate by a planter of 14 years' experience; testimonials and references given if required.

u. c. Apply PADDY,
C/o this Paper.

Tea Planter. In 5 to 6 months time by a Managing Proprietor about to sell property, an appointment as Superintendent of a Tea Estate or a large tea house preferred. Mincing Lane and Assam experience. Command of Labour.

Apply T.,
C/o this Paper.

from what we have gathered, we believe the local manufacture of this material would result in an enormous saving in cost. The bulk of this manure is fibre, so that the cost of freight would only bear on the actual chemicals used to impregnate the mass. We have no wish to "boom" a patent manure, but in support of a correspondent's opinion on the subject, the following letter from a well-known Ceylon planter will be of interest. It shows how Col. Thompson arrives at his new estimate of one ton being sufficient for 3,600 plants, instead of 300 plants, as proved "Toda" on the original prospectus.

We may point out that the success that has hitherto attended trials of this fibre in all parts of the world has been phenomenal, so that whether planters find it profitable or not to make large use of it, will not appreciably affect the future of the investment in the shares of the Company.

Extract from Report on Experiments made with Jadoo, by
 M^r. GEORGE H. GREEN, of Callendar Estate, Ohiya, Ceylon.
 20th October, 1896.

I have completed my experiments with the Jadoo Fibre and Liquid. In regards tea nurseries, I put some into old nurseries which had been replenished with good black jungle soil, with the exception of a piece containing the Fibre. I found there was not much difference in the growth of the plants, any slight difference being in favour of the Fibre.

My second experiment was in *very bad* soil, utterly unsuitable for tea nurseries in its present state; but the Fibre brought the seedlings on nicely, and they looked healthier and stronger than if I had sown the seed in ordinarily good soil.

My third experiment was with vegetable seeds, and it was here I had the most marked success. I grow vegetables from seed regularly, but I have never seen the seedlings shoot up so strongly and healthily as they did in the Fibre. They germinated also very much better. In the Liquid, I had not sufficient to experiment on the tea nurseries, but I found it useful and beneficial in watering the vegetable seedlings which had been transplanted from the Fibre, and I did not notice that grub attacked the young plants like they usually do.

From my observations, I consider that to be of real use in tea nurseries, the Fibre must be put three or four inches deep, because the plant has a long tap root, and though the feeder roots are at the surface, they continue down the length of the tap root for a little way, and so it is natural that the young plant does not get the full benefit of the Fibre unless it is laid rather deeply. I also think that it would be of the *greatest service* in "supplying" tea plants in vacancies caused by deaths, either to place the Fibre in the hole immediately before planting the new plant; or if baskets are used, to fill half the basket with the Fibre instead of with earth.

For market gardening, I think it should be of the very greatest benefit, and, indeed, for every householder who grows his own vegetables.

Trenching in poor soil. A planter draws attention to the great mischief caused to plantations with poor shallow soils by some systems of trenching. "I have never quite understood the *raison d'être* of trenching in thin poor soils; with red laterite scarcely half a foot below the surface. Is it to prevent the rain washing away what surface soil there is? Then why not confine that operation during the rains only. No, it is said, you must keep the trenches open to 'aerate the soil.' What a term to conjure with this, the 'aeration of the soil'! What injury is not done in its name, what expensive fads and ludicrous experiments have not been aired and tried in its support. But this is a digression. The aeration of the soil is undoubtedly an excellent thing to strive for, and nowhere more so than in poor shallow soils. But does the usual, or shall I say, a common form of trenching, answer the purpose? The trenches are opened and blocked every few feet by a strip of undug soil, catching water and preventing

drainage as well as wash. The bottoms of the trenches are not forked, which would help the water to drain in the subsoil. Lastly, and most fatal of all, the earth from the trenches—the raw, sour subsoil—is spread over the surface soil between them. Short of no cultivation at all, I cannot conceive of any better means both to stop aeration and deaden, *i.e.*, render inert, what fertility there may originally have been. To take the points one by one, and as briefly as may be. The blocking of the trenches, and non-forking of the soil, results in so many long pits to *hold water*. Where water does not freely penetrate, there can be no aeration. I said it prevented wash. It does. But it is worse than wash if anything. The soil from the trenches is thrown out below them, effecting precisely the same thing as wash, *i.e.*, a transference of soil from its original position to one lower down the slope of the hill. The main object, as I have already stated, of trenching is to prevent loss of surface soil. Yet the covering up of the surface soil by the raw trench soil completely neutralizes this. As everyone knows, who knows anything at all about scientific agriculture, fertile soil is literally living soil, *i.e.*, soil full of living organisms. This life can only endure under certain conditions, one of which is air. Now raw subsoil in South India is synonymous with iron soil in its crudest and most harmful condition. One of its baneful effects is an inordinate greed for oxygen. Consequently, until the layer of subsoil has had its wants in this respect satisfied, the *once living surface soil remains dead*. And how the feeding roots of either coffee or tea can be supposed to thrive in dead soil surpasses my humble comprehension. There are three obvious ways of remedying the above defects in this style of trenching. First, let the trenches be *unbroken* throughout their entire lengths, for if they are dug between every row or every other row of trees there can be no wash. Secondly, let the soil be thrown above the trenches, this will ensure it being spread for only a short distance and save the otherwise inevitable barking and hacking of surface roots in the process of covering. Thirdly let the bottoms of the trenches be *forked* at least half a fork deep. To sum up, the faulty style of trenching to which I have alluded, is nothing more than fallowing the land, in other words, a cessation of crop for the time being. If planters can afford this, well and good. At present I believe there are few who can. I know my readers will excuse my dogmatic style, as it is the essence of planting controversy to be downright, if not pigheaded."

SCIENCE AND SOILS.

II.

(Continued from our last.)

Moisture holding powers.

Upon the prevention of surface wash by deepening the surface soil, although there is some difference of view, the weight of opinion agrees that "deeper plowing saves the top soil." The practical opinions agree, with one exception, that "constant cropping" and movement of the soil injures the mechanical state, and "lessens the power of the soil to hold moisture." We have already shown that soils which receive a small rainfall have less power to hold water, specially on account of their less content of organic matter. We are persuaded, however, that much of the "loss of mechanical state," the tendency to pack which follows *constant cropping* is due to the need of lime in some form, the form of application depending on conditions. We have seen close, heavy, packed land on Kauai utterly changed by use of coral sand, and the crop increased by one-third. Some soils complained of to us as being in bad working condition,

we have found to contain more than 0.5 per cent. nitrogen, which means an excess of organic matter, but they were nearly destitute of lime. One physical action of lime in the soil is to gather the minute soil particles into clusters or "aggregates," and thus prevent them packing together. Virgin soil, even poor in lime, is friable and works easily. The grass roots, like trash, prevent packing while they last, but with cropping the large particles of vegetable matter disappear. Lime is of imperative value for mechanical as well as chemical reasons.

Then follows an interesting note on the value or otherwise of adding humus to the soil. It is pointed out that in districts where there is excessive rainfall, resulting in great quantities of vegetable matter, the addition of humus is positively harmful, inasmuch as it intensifies the sourness of the soil.

Nitrogen. In the soil report of last year it is stated, and supported by data, that the high lands, notwithstanding their high content of nitrogen, are notably less productive than the lower lands, and become rapidly non-fertile. That observation, confirmed by other observations, and by actual tests, led us, even in view of the large nitrogen content of our soils, to say that "the crying want is nitrogen," and that "50 pounds of nitrogen given to the soil in an available form is of more moment to the growing crop than the 17,000 pounds of organic nitrogen lying inert in each acre of land." These were strong, possibly bold statements, and required to be tested by trials and results. So far as analyses were available of fertilizers that had been used upon these islands, it was found that the composition ran in general about as follows: 15 per cent. phosphoric acid; 5 per cent. to 12 per cent. of potash; and from 2 per cent. to 3 per cent. of nitrogen. If our view was correct concerning the predominant want of our soils, and the particular need of the cane crop, it was clear that fertilizers of the composition stated did not meet those needs, and there was little economy in their use.

The formula most generally advised by our Bureau for the preparation of fertilizers requires: 8 per cent. phosphoric acid, soluble in water, 6 per cent. nitrogen, and variable proportions of potash as suggested by individual soils. The forms in which the nitrogen and potash are being used will be discussed in another place.

We, personally, after noting the action of given fertilizers in the field, and upon a scale covering areas upon all the islands, find our statements of last year amply confirmed.

Value of Sulphate of Ammonia. In our report on fertilization last year the conditions were discussed which control the form in which nitrogen is most advisedly applied in definite locations. Examples were given stating situations where it is strictly inadvisable to use nitrogen as nitrate of soda, and other examples where that very soluble salt was the saving and making of the crop. Further we stated our belief "that nitrogen in sulphate of ammonia has a higher value per pound than nitrogen in any other form for the cane on these islands." We maintain that statement now, in the sense that sulphate of ammonia is a form of nitrogen most unquestionably best adapted for covering the greatest diversity of conditions. Its solubility in water gives it a large measure of the active property of the nitrate, while its behaviour in relation to the soil is a protection against waste by leaching in moderate climatic conditions, analogous to the properties of organic nitrogen fertilizers. The testimonies that we have recorded from numerous plantation managers concur in giving to sulphate of ammonia a very high value, which they also accord to nitrate of soda in very dry situations. We must bear in mind, however, that ammonia sulphate has just recently come into use with us, and we have had difficulty in securing its use by reason of the greater price of the nitrogen per pound. Notwithstanding our personal belief in sulphate of ammonia as a nitrogen compound having the maximum value for general use, the further study of our soils, and of the climatic conditions which control their mechanical state and physical properties, cause us to believe that proportions of soluble or crystalline nitrogen and of less soluble, organic nitrogen, added together, may have a value not yet set forth. In our report on soils it is shown that our makai lands are generally poor in organic matter, and as a result of this poverty these lands have a small capacity to absorb and retain moisture. The crystalline salts of nitrogen exercise no permanent action upon the physical properties, unless it should finally be proved that nitrate of soda does operate inimically in this respect.

Animal nitrogen. Organic nitrogen fertilizers contain organic matter in addition to the nitrous constituents, and this organic matter, not only can aid in ing moisture before the fertilizer becomes decomposed; certainly its decomposition products can furnish permanent additions of organic matter to the soil. If humus is one form of these "permanent additions," we have then to admit that some portion of the organic nitrogen has not been used by the cane for there is no formation of humus without nitrogen. In our report on fertilization last year we gave reasons for stating that probably a small portion of the nitrogen of all organic fertilizers is permanently added to the stock of organic matter in the soil. Therefore, for our low lands, of smallest rainfall, we are advising, very generally, that the nitrogen shall be supplied in the several forms of nitrate, sulphate of ammonia, and of fish scrap or dried blood, strictly requiring that the fish scrap shall be free from excess of fats. In special situations and for special results, nitrate of soda or sulphate of ammonia are advised alone. Organic nitrogen alone on our low lands, with meagre water supply, causes a loss by reason of its slow action. A notable example of this was observed at Spreckelsville. Fish scrap was added to a portion of a field of cane, and is now working well. It, however, was several weeks before any activity was seen, and that slowness to act lost the cane one month of growth in the most active part of the growing season, in the comparison with the result of sulphate of ammonia. A little nitrate upon another part of the field, where the cane, after ten days, felt the action of the nitrate, and the ammonia sulphate maintained the growth up to the present time.

Excess of humus. On our mauka lands, whose soils are frequently in a very granular and porous state, and where the rainfall is very notably greater than on the low lands, we have to be guided by other considerations than those expressed in relation to the makai lands. The high lands are full of organic matter and of organic nitrogen; therefore organic fertilizers are not needed for physical reasons. The open state of some of the upland soils, and the greater rainfall, place nitrate of soda out of question; and examples are known where sulphate of ammonia disappeared too rapidly. For these lands sulphate of ammonia is advised to start the growth, but the bulk of the nitrogen is most safely applied as fish scrap or dried blood. In extremely wet situations, sulphate of ammonia has recorded some examples of excellent results. On the other hand, when the application was suddenly followed by a deluging rain, no results were seen, and these examples cause us to advise that the sulphate of ammonia shall be supplemented by organic nitrogen. Under such rains as we witnessed in Hillsboro, newly-applied fertilizer of any kind can escape waste. As already remarked, the form in which nitrogen shall be supplied is largely controlled by the soil and the climatic conditions.

(To be continued.)

LAND ON THE ANAMALAIS.

THE following proceedings issued by Government have reference to a Memorial received from Messrs. Edmiston, Windle, Rhoads, James, Allan, Brodie and Narasiah on the subject of the grant of lands on the Anamalais:—

The memorialists object to (1) the auction system which has been decided upon by Government, (2) the allotment of only 1,000 acres to each of the original applicants, (3) to the terms laid down ensuring the land being opened up within a certain period, (4) to the rule regarding relinquishments. They ask (5) that no assessments shall be collected until the road is completed, (6) that houses may be granted on special terms, (7) that the charge on grass land may be reduced, (8) that when land is resumed by Government, purchase money may be refunded, and (9) that the time for selection by original applicants may be extended till the 31st March, 1900. The Collector of Coimbatore in dealing with the Memorial states that objections 3, 6, 7 and 9 have already been dealt in a letter dated 2nd October, 1896, on Cur. No. 280 (vide Board's Proceedings, F. 494, dated 23rd October, 1896). The first objection is to an essential part of the policy of Government and he did not consider the terms should now be altered. It was not, he thought, at all certain, that there would be much competition for the land, and if there was it would only show that the privilege now asked was a very valuable one. The second objection was to some extent reasonable. It was a fact within his personal knowledge that Mr. Edmiston's large application was made for a syndicate of nine or ten gentlemen.

THE MADRAS EQUITABLE ASSURANCE SOCIETY

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George.

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ... Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.),
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)
SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr)
W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.
Immediate payment of death claims, on official notice in any of Her Majesty's Government Gazettes sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium ^{and} for payment of death claims.

On Policies transferred to the London Register, ^{or} death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premium during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 at Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers

ers, Binny and Co. and persons connected with the firm put in less than nine applications, and were entitled to 6,000 acres, whereas Mr. Edmiston's syndicate could only obtain 1,000 acres. Other applicants were similarly circumstanced, and it might perhaps be advisable to allow single blocks of 2,000 or 3,000 acres to be taken without auction by the original applicants, but not to allow them to split up the amount of the land allowed to them. If it could only be shown, the Collector says, that the rule regarding relinquishments worked hardship in any particular case special consideration might be given to that case. The fifth request was unreasonable because there were many planters who paid assessment, and had bought estates many miles from the cart roads. The eighth request, however, was reasonable.

The Board of Revenue in forwarding the Memorial to the Government concurred in the Collector's remarks.

The following is the Government Order on the Memorial:—

G. O., No. 694, Revenue, dated 4th December, 1896, the Government has already sanctioned the refund of the purchase money and that are resumed and the extension of the time of selection to the 31st of March. The question whether partial relinquishments should be permitted and the objections now raised by the memorialists to the terms laid down for ensuring the opening up of land were considered at the same time, and it was decided that an enhanced rate of assessment—Rs. 2 per acre—should not be imposed on more than 50 per cent. of each holding unless a larger portion were actually cleared but that no further concession was made for. The Government is not prepared to reconsider the orders directing that the lands shall ordinarily be sold by auction and giving the maximum area for selection or for auction purchase at 60 acres, and cannot entertain the request that no assessment should be levied until the main road is completed. As regards the memorialists' request that house-sites and grass lands may be granted on favourable terms, the Government observes that a similar concession was raised in paragraph 16 of the Collector's letter, dated 10th October, 1896, printed in G. O., No. 694, Revenue, dated 4th December, 1896. The Board of Revenue then held it premature to consider what should be done with regard to the grass lands, which were remarked were trifling in extent, and instructed the Collector to refer for special orders applications for house-sites which might be received. The Government has since further considered the question and is not prepared to issue any orders enabling applicants directly to extend the area obtainable on favourable terms, which should ordinarily include the land required for building purposes.

The following order has reference to an application by Mr. E. G. Windle for a grant of land of 25 acres for cooly lines, etc.

A large open space, several hundred acres in extent, consisting of grass land and rock was included within the limits of the original application of Mr. E. G. Windle, of Kotagiri, for land on the Malais. On the 2nd November he applied for this land and to be allowed to take it up on special terms, in addition to an application for 1,000 acres of forest land which he proposed to put in. The Collector was unable to support his application as he considered that the open area should be retained for public purposes for the following reasons:—

There are a number of Khaders living there and they should be allowed to move about on this land.

The main road will probably pass through it.

A forest rest-house will probably be built on it.

A large rain-gauge will probably be set upon it.

It is a suitable halting place and camping ground.

It would be made use of in this manner by coolies and pack-
lock drivers and by planters and others passing through.

It would be required for assigning small plots to planters for temporary use for the construction of sheds for coolies, for storing
&c.

Mr. Windle then asked for 25 acres of this land at its eastern end, for building cooly lines, and the Collector seeing no objection to this, requested to know on what terms this and similar applications could be disposed of. He recommended that there should be a maximum of, say, 20 acres for land like this which is wanted for a particular purpose, and that it be granted without auction at a yearly annual rental of As. 8 per acre, with liberty to the occupier to relinquish at any time.

The Board of Revenue approved the Collector's proposals, it being understood that grants of the land could only be made to holders of the best land under the rules sanctioned by Government for the Malais.

The following is the order of Government on the subject:—His Excellency the Governor in Council considers that the effect of the grant of the concession recommended by the Collector is the indirect extension of the maximum area fixed by Government in the case of each applicant and that a new set of rules would have to be framed in order to provide for the grant of extra land at a low rental and subject to relinquishment at any time. This, in the opinion of His Excellency in Council, is inadvisable and the Board will therefore be requested to withdraw its approval of the Collector's proposal.—

THE COCCIDÆ OF CEYLON.

PART I.

THE following review of Mr. Green's book is taken from the *Ceylon Observer*:—

Belonging to a family of entomologists, Mr. Ernest E. Green has pursued his scientific researches for many years, and in finally deciding to deal exhaustively with that species of scale insects known as Coccidæ, he has engaged in work which will cause the practical representatives of several great agricultural industries to be deeply indebted to him, and which at the same time will enrich the field of scientific knowledge. As he explains in the opening words of the preface:—

The present work has been written with a two-fold object. Firstly, to give a scientific and formal description of this little-studied but important group of insects; and secondly, to enable planters and agriculturists in general to recognise these destructive pests, to understand their habits, and to learn how best to deal with them.

How thoroughly Mr. Green has pursued his studies and enquiries

may be gauged by the statement that in 1891, when Mr. W. F. Kirby published his "Catalogue of the described Hemiptera, Heteroptera and Homoptera of Ceylon," only seven species had been recorded. Mr. Green in November, 1894, drew up a preliminary catalogue in which he enumerated 72 distinct species that he had then found in Ceylon. This large number will practically be doubled in the present work—for Mr. Green has nearly reached that number, and since his recent return to Ceylon he has added three or four new species to the list. The author himself observes that when other parts of the island have been properly explored, it is probable that considerably over 200 species will be recognised. To secure uniformity of terms, every species, whether new or not, has been fully described according to a uniform plan, while the figures (unless otherwise stated) have been drawn from and refer to Ceylon specimens only. Some of them may possibly differ slightly from typical examples, in such minor points as size and colour, but this much enhances the utility of the volume from the Ceylon point of view.

On each of the 33 plates issued with Part I—and which, we think, notwithstanding their being of smaller size than the letter-press pages, should still be inserted where intended in the text—will be found one figure representing the insect of natural size, in its natural position on the food plant. The other figures on each page have been enlarged to such a degree as to conveniently show the requisite detail. We have already described the exquisite finish of these plates; and, whether from the point of view of outline, shading, colour, or number of illustrations on each plate, they leave nothing to be desired in the pictorial department. The actual measurements of each species are given in the descriptive letter-press in millimetres, as the metric system is being universally adopted for scientific purposes; but even in this matter the author has not forgotten to assist the uninitiated, and includes a scale of the two systems, so that those more conversant with the English standard of inches may find their comparisons facilitated.

Besides naming and thanking leading authorities in England, America, Bohemia, New South Wales, New Zealand, and the Cape for valuable aid given to him, Mr. Green says:—

Most of the species described in the present work were collected by myself, chiefly in the neighbourhood of Punduloya at an altitude varying between 3,000 and 4,000 feet. Some particularly interesting species were discovered and sent to me by that most industrious entomologist, Mr. John Pole, from Hambantota, Tangalle, and Chilaw. Mr. W. D. Holland, of Balangoda, has also very kindly sent me specimens from that district.

The coccidæ—like other insect life—can breed all the year round in a land of perpetual summer like Ceylon, and when imported have always speedily increased. They are, happily, kept in check by both vegetable and animal enemies, and are particularly susceptible to destruction towards the close of the rainy seasons. In the introductory chapter—as distinct from the preface—the author mentions some of our worst enemies among the coccids, such as green bug, black and brown ditto, "greedy scale"—which has somewhat recently found its way here, and is responsible for many weakly tea plants—red-spider, mealy-bug, scale, &c. The common guava tree is a fruitful centre of infection, and ornamental plants and coffee and tea bushes when sheltered are much more subject to attack than exposed ones. Of remedies, Mr. Green mentions the lady-bird beetle, the larva of the "lace-wing" fly, the larva of a small blackish butterfly, &c., as external feeders, besides a number of parasites, or internal feeders.

The second chapter of the book deals with the collection and preparation of specimens, which should prove of much value to those wishing to commence a study of the coccidæ group of insects. In the next chapter the subject of characters and classification is dealt with, after which the writer takes up the sub-families and treats of each genus in truly scientific detail and language. Here the extensive glossary provided will be found invaluable; and with his studies thus aided the interested reader may well be encouraged to possess Mr. Green's publication and master its contents.

The economic side of the question—insecticides and preventive measures—is to be taken up in Part II, and will be attached to it as an appendix; and we hope to see this second section of the work ready before the middle of the year. Above all, we trust that there will be many orders for the publication from estate owners and estate companies besides other public bodies and private individuals, and that Mr. Green will find his labour of love no actual pecuniary loss. This our community can assure for the author, though it must

continue ever indebted to him as a general benefactor by reason of the public-spirited collation of his long years of investigation and discovery.

RHEA-CULTIVATION IN KANGRA.

[Being extracts from a report to the Government of India by James Montgomery, Esq., Kangra.]

Propagation.

(1) By seed: This course must be adopted in some cases when the germ of the plants has to be carried over great distances; but probably much disappointment will attend the result. To obtain the seed great care is requisite, and a favourable atmospheric season. For this purpose young spring seed should be carefully reserved in a well sheltered position. These plants should receive special care and be well manured. During the rainy season they must be kept thoroughly drained and after that has passed, the ground should be carefully loosened round the plants. If the rains cease early in October a fair amount of seed may be obtained; but, as far as I judge, no amount of care can ensure success, so much depends on the season, a dry one being most favourable for the full development of the seed. The only method of solving, which I found successful, was on a gentle hot-bed under glass, in March and April; the seed scattered over the surface, covered very thickly with sifted earth, and carefully shaded from the sun, until the plants were about three inches high, when sunlight should be gradually admitted. When sufficiently strong they should be planted out a foot apart every way.

(2) By cuttings of the stems: The stems should be selected from grown ones, allowed to ripen well and not cut until duly ripened. Then divide the ripened portion of the stem where the leaves have turned fully brown into short lengths, each including one eye or bud, cut a quarter of an inch below the bottom bud and as much above the top one, and plant with the centre bud downwards with the surface. If the weather be damp and cloudy, the cuttings readily strike root, otherwise they will require shading for a week or ten-days, the soil being kept moist. As with seed, I find a foot apart every way the most advantageous distance, very few shoots are thrown up the first year.

(3) By divisions of the roots: This is by far the most advantageous and profitable method. The plants for this purpose should be three or four years old. After gathering the crop, dig out each plant carefully and remove the earth from the roots. I generally put the mass of roots into running water for a short time; this cleanses them thoroughly and enables the gardener to see his work clearly. The tuberous portions of the roots will be found to show a large number of eyes similar to those on a potato. From these carefully separate portions containing five or six eyes; let the cuts be clean and reject all fibrous and decayed matter. Expose these sets to the sun for a couple of hours to dry the surface of the wounds, and then plant six inches deep, and at the full distance of four feet apart every way. In this way two good crops will be obtained from the first year.

The soil and situation for plantations.—A rich loam suits the plants best, but they will grow in any kind of soil, provided a full supply of moisture be available, combined with the drainage. The latter is emergently required, particularly in the rainy season, as should the land be retentive and be swampy the plants will decay in a very short period. If the land be poor, a liberal supply of manure is requisite, otherwise the stems will be short and weak, yielding scarcely any fibre. In no part of Upper India can the plant be successfully cultivated unless water for irrigation be available during the rainy season. The facilities for obtaining an ample supply of water, combined with moderate temperature at all seasons, render the district particularly favourable to the plant.

Investors should consider the meaning of a MONOPOLY of a material coming into general use for growing "supplies" for Tea and Coffee Gardens in the Tropics, or replacing Vines in one single district in France, and judge for themselves as to the return they are likely to get on Capital invested in this Company, bearing in mind that the raw material used to make JADOO is practically inexhaustible, and that as trade increases the prime cost will steadily decrease, as labour will not form nearly so large a proportionate item on a large trade as on a small one.

Full Prospectus, with Testimonials from all parts of the World, on application to PARRY & Co., Madras.

Cultivation—Should the land have been stocked with seedlings or cuttings (paragraphs 4 and 5), then in the following ring, after having reaped the first crop of available shoots, every other plant should be transferred to fresh ground, and put down three feet apart. The following year the same course should be pursued, taking up each alternate root and replanting at four feet apart. After this the plants may well remain undisturbed for four years, hoeing well between after each crop, clearing the weeds, irrigating moderately during the dry season, and supplying manure where necessary. The only manure I had at my command has been vegetable, consisting mainly of the leaves and good portion of the plant itself, and of tree and vegetable leaves stored up for the purpose, with which I mix a considerable amount of wood-ashes. With the aid of this only I have kept plants growing in the same spot for upwards of six years; but consequent on the then very crowded state of the ground, the stems were short and very weak. I would therefore recommend thorough removal after four years, the land to be then well trenched, cleaned and manured.

Gathering the Crop.—The period of reaping will vary slightly according to difference of season. I find that in this district three good crops can be relied on each year;—the first during the latter half of April, the second about the commencement of August; and the third about the end of November. It will be found of much advantage to postpone reaping the second and particularly the third, as long as the condition of the plants will admit. If the third crop be cut in the middle of November, the weather here during the remainder of that month is not sufficiently cold to keep back the new growth; and should the young shoots appear above ground early in January, the forests which are usual at that period seriously injure them and lessen the spring crop. My own experience indicate that the stems should be gathered so soon as the cuticle shows a clear brown colour for about one-third of the length. At this stage, if the soil be good and the plant healthy, the stems will be clean from butt to point, the leaves of a rich dark green above, and pearly white below, and the branch-buds, at the axil of each leaf-stalk just showing. If gathered earlier than this I find the connection of the fibres very weak, and that a considerable portion separates in the operation of scraping the peel. If allowed a further growth, the axillary branches will have been thrown out, which will cause breakages at every point both in peeling and cleaning.

The average height of stems grown here has been six feet, after cutting off the soft portion at the top. In gathering I supply each coolie with a sharp pruning knife. With this they cut the ripe stems close to the butt; these are removed in bundles by boys to the nearest manure pit. Here the boys cut off nine inches of the top and pass one hand with a gentle pressure from top to butt; this removes every leaf. The stems are then placed in clean water from whence the peelers remove them and separate the peel, which is again thrown into water, from which it is withdrawn as wanted by the men who clean it. Then lay three or four strips of peel on a flat board, scrape it a few times on the inner side from butt to point, then turn it over and repeat the scraping, which removes the cuticle: it is then hung up or thrown on clean grass to dry.

Taking the distance of four feet apart for fully bearing plants, an acre will contain (allowing for paths and water channels) 3,000 plants: more than this I find to be too crowded and to increase labour while lessening the actual yield during a four years' period. Thus planted the yield will be a steadily increasing one, and the plants will not show any deterioration.

From repeated experimental weighings, I have deduced the following average proceeds from 1,000 freshly cut 6 feet stems:—

Weights as cut		lb.
Do.	When dried	286
Do.	Fresh peel	77.5 = 27 p.c.
Do.	Dry peel	83 = 29 "
Do.	Fresh wood	21.5 = 7.5 "
Do.	Dry wood	203 = 71 "
Do.	Clean dry fibre	56 = 19.5 "
Do.	Water	18.7 = 6.5 "
		208.5 = 73 "

If larger stems, from 7 to 8 feet, be taken, the average is less in the weight of peel, but in the outturn of clean fibre it is slightly greater. With small stems from three to four feet, the percentage of peel is markedly greater, but the return of fibre is barely 35 per cent. Moreover, the extra labour in cutting, peeling, and cleaning these small stems is an important consideration.

The crop cut during the rainy season will always contain a large percentage of water, and that of clean fibre be found rather less, the fibre being also softer than at the other periods of cutting. This I consider due to the fact that at this period the resinous matter in the plant is in a more diluted state, and consequently a greater portion of it is removed during the process of washing and scraping the peel.

I have already expressed my opinion against the use of either immature or small stems as likely to give a result inferior both in quality and quantity: yet I am fully satisfied as to the advisability of not only sorting the crop, as cut, according to length of stem when necessary, but I would further recommend that the peel from all stems of five feet and upwards should be divided into two, and the fibre from the upper and lower portions kept distinct. If cultivated as I suggest, the difference in length of the stems at each cutting will be found very small, the monsoon crop always giving the longest stems.

Taking the above as a basis for calculation and knowing that each plant established as I recommended will give at least an average of six stems during the first year, I assume:

$$\frac{3,000 \text{ plants} \times 6 \text{ stems} \times 3 \text{ crops} \times 18 \text{ lb.}}{1,000} = 972 \text{ lb.}$$

per acre per annum

In earlier estimates, calculating on closely-planted crops and stems four to five feet, I was cautious to restrict my estimate to 750 lb. per acre, but five years' additional experience has shown me that with proper open cultivation 1,000 lb. per acre may be fairly assured

LETTERS TO THE EDITOR.

ANSWERS TO CORRESPONDENTS.

[M. E. D. REARDON. Your recent "discovery" of the two great enemies of coffee, viz., leaf-disease and borer, is a great one, and you do well to acquaint us therewith. It seems almost a pity to have to state that S. Indian planters have a long and painful acquaintance with both. Perhaps your "cure" will be a few years more up to date?

"BET." Very sorry allusion in a letter in last issue crept in. Your address has been mislaid, or we would write you direct.

"MYSORE KOLA NUT." We expect the seed must have dried before reaching you. Some of the same lot germinated at Burliar (Nilgiris) a week or two after sowing.—ED.]

KOLA NUT.

SIR,—You have had a good deal to say re the above in the

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't despair, even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

P. O. lately; but can you tell me whether *anyone* in S. India has a four-year old tree and does it show any signs of bearing? I do not think there will be any difficulty about growing it, but will it produce fruit?

It would be rather serious to put out thousands and then find it will not crop. I understand it wants the same treatment as 'Cocoa,' and as that product *will not* grow on the Nilgiris, the question is will 'Kola'? Information will oblige.

ANON.

[The question is essentially one for experiment. We understand that Kola will thrive under the same conditions as Liberian, though it does best on cocoa land, *i.e.*, river sides and flats. We believe that there are no trees four years' old in this or any other district in India or Ceylon.—ED.]

JADOO FOR SUPPLIES.

SIR,—In one of your last issues you published a long letter from "Toda" on Jadoo, and remarked that it was a "crushing rejoinder" to certain criticisms on his former letter. Perhaps your correspondent will kindly exercise his pulverizing powers on the following statement of Colonel Thompson's to the Editor of the *Indian Planters' Gazette*. Colonel Thompson states that a planting basket half-filled with Jadoo is quite sufficient to bring on the young plant. He reckons that a ton in this way would be sufficient for 3,640 baskets.

"Toda" holds that the price per ton on the estate comes to Rs. 170. The prospectus states or stated $3\frac{3}{4}$ peck were required for each supply plant, the price running out to 9 annas each. A ton is thus sufficient for 300 plants.

But if you accept Colonel Thompson's later statement, which seems on the face of it very reasonable, that half a planting basket is sufficient, a ton will serve 3,640 plants. Therefore, taking "Toda's" price of Rs. 170, *each plant will only cost a little over 9 PIES each.* Wherefore I say

TRY JADOO.

BAT GUANO.

DEAR SIR,—I enclose cutting from the *Produce World* of the 5th of February re "Bat Guano." This reads as if it would be most suitable for coffee, and I should be obliged if you or any of your readers could give me any particulars as to whom to apply to in India, etc.

GOOBOOR ESTATE,
KOPPA, March 11th, 1897. }

Yours faithfully,
WALSHAM H. MAYNARD.

Bat Guano from New Caledonia will, in our opinion, edge itself pretty effectually into public favour, if anything comes of the proposed syndicate which is now said to be in course of formation. For some reason or other—conservatism doubtless—people in Caledonia who have hitherto approached London traders have received only scant encouragement, and the trade has been stifled to a degree that is almost beyond comprehension. Samples of this guano have been put before us, which have varied considerably in quality, some containing 2 per cent., and others as much as 8 per cent., of ammonia, while the percentage of phosphates were found to vary from fifteen to twenty. A fair average quality should contain 5 per cent. ammonia and 16 per cent. phosphates, and would then, we should say, be saleable in the London market at £5 to £5 5s. per ton. Those of our readers who have kept a jealous eye on this business will certainly do no harm in embarking in the trade on a moderate scale, and up to the end of April the rates as quoted above can, we should say, be relied upon. As we get into the summer, it is possible that rates will ease off slightly.

TRANSPORT OF TEA LEAF.

SIR,—Can any of your readers tell me the best way to transport green tea leaf by coolie or by cart for a distance (in time) of some three hours for former and four hours for latter?

I have an idea that an arrangement of basket trays would be best for the carriage of the leaf when partially withered, so as to let it get heated on the way: the fresher the leaf and the more moisture it contains, the easier it will heat, which course is a thing to be avoided.

A friend, whose advice I asked on the matter, said that he found the best way was to let each picker bring over his own kanak of say twenty pounds or so, and gave some further details which he might perhaps reproduce with advantage here. I have a great respect for my friend's judgment, but would like to know if there is any other mode than the one he proposes as it is impracticable in my case. I remember some years ago seeing a great deal of writing in the Calcutta papers about this very matter, one man advocating withering the leaf and pressing it down tight in boxes by means of heavy weights, nailing the lid, and so to the factory.

Any information on this point would greatly oblige your enquirer.

TEA LEAF.

MYSORE MUGGERS.

DEAR SIR,—When out teal shooting a few weeks ago with a couple of Griffs, I told them that at one time a "mugger" inhabited a certain tank in the neighbourhood, but had been shot by a native, and that I had seen and measured the reptile.

Griffs appeared sceptical, and asked how the mugger had got there. I said it had probably travelled overland from the river some 3 miles away.

Still more scepticism, and one Embryo Shikar told me I had better write my experiences of "perambulating muggers" in your valuable paper.

Have you or any of your readers ever heard of muggers (Indian Crocodile) travelling overland from one piece of water permanently bred in, and inhabited by them—to another—search of food? I often have, and so have many others. Poor Morgan is not above ground to reply to this. What has become of your Shikar Editor, and that chap who used to write shikar* stories for you?

"LONG BOW."

MYSORE PROVINCE.

*Your qualitative expression, which we have omitted, is unparliamentary. Would not the word "glowing" express your meaning sufficiently? In reply to your kind enquiries after our Shikar Editor, we are happy to say he is flourishing, but is too busy converting his jungles into plantations to find time to write about the denizens of the former.

THE ADDRESS AND THE TRUST FUND.

SIR,—I was greatly surprised some time ago to hear that a proposal had been made to give a donation to the Indian Famine Fund from the funds of the U. P. A. S. India, and have just read Mr. Granville L. Acworth's letter in your issue of the 6th instant, in which he proposes to present an address and casket to Her Majesty the Queen-Empress and that the expenses be paid from the Reserve Fund of the U. P. Association. Now while all will agree with his proposal to present an address, &c., many like myself will object most strongly to the funds of the Association being used for anything but the purpose for which it was understood the Association was formed, *viz.*, to advance the interests of the planting industry in S. India. I am sorry to see, Sir, that you countenance the proposal to use the Association Funds on the plea that it would be a good advertisement. I am quite sure the majority of Planters do not wish to make use of the occasion as a medium for advertisement, but would be only too delighted to show their loyalty and since

ration for Her Majesty in the way proposed without touching funds of the U. P. Association. Many Planters who would be willing to subscribe for this purpose, will think a good before putting their hands in their pockets to replace money taken from the Reserve Fund.

While on the subject I should like to ask if the U. P. Association of S. India has any legal standing? Has it been registered under an Act and has it Articles of Association to show purposes for which it exists and to which the funds may be applied?

MYSORE PLANTER.

"IMPROVED COFFEE SEED."

RE,—I am afraid your correspondent "Bet," in your issue of March, has not read his *P. O.*'s very carefully or he would ask the question he does at the end of 1st para. of his letter! If he will refer to *P. O.*'s Nos. 2 and 3, pages 70 and 104, I think he will get all the information he wants. Mr. Hooper, Chemist of some standing and Botanist of no mean order, (old Medalist I believe,) writes very clearly on the subject.

It is not for me to "crack up" my own pullet, but I will say this much, that until I began to plant out "*my seed*" plant, "*vacancies*" I had little or no success from so-called "*improved coffee*" that I used to buy year after year. The plants grew very well in the nursery, but no sooner were they out in the field, than they began to sicken and die; whereas for the last three or three years I have been most successful, *e.g.*, my June—July supplies of 1894 being five to six feet high and sturdy, healthy, etc., and a very small percentage of failures among them. My coffee elevation 3,000 feet, rainfall 39 inches, cultivation under shade, manure *cattle only*.

I shall be glad to give "Bet" any further information he may require if he will write me direct.

The difficulty now is to get the several kinds of "coffee seed" that have been sent to me analysed, for now that Mr. Hooper has left the Hills, the one or two who do a little in the analysing have stuck on their charges, and it seems to me that the P. A. S. I. might well turn their attention to an "analytical chemist" of their own. Why not start a "Chemist Fund"? It seems to be the day for "Funds"!!

CATTLE AND POONAC: COMPARATIVE VALUATIONS.

RE,—I am afraid your correspondent "Poonac" in his letter on this subject in your last issue has got slightly out of his head. His figures for the nitrogen in cattle manure and Poonac, *i.e.*, $\frac{30}{4}\%$ and 10% , are both too high. The former cannot safely be put higher than $\frac{1}{2}\%$, which gives about 11 pounds of nitrogen per ton. The latter is certainly far too high, as the average for South Indian Poonacs is 3% to 7% , a safe average being about $4\frac{1}{2}\%$, or about 100 lbs. of nitrogen per ton. Taking these figures for cost on the estate and application on the estate as correct, for these vary in every instance, the calculation would be somewhat as follows, taking a thousand trees instead of an acre as the unit of comparison.

Cattle Manure. 1,000 half bushels every third year = say 166 bushels per annum, divided by say 40, equals say four tons = 1 per ton, Rs. 4, plus cost of application (Rs. 20 every three years = $20 \div 3$, say) Rs. 7. Total cost Rs. 11, giving at $\frac{1}{2}\%$ of nitrogen, 92 lbs. of that element, at the remarkably low cost of 1 anna over 2 annas and 9 pies per lb.

Poonac. 1,000 $\frac{1}{4}$ lb. doses every year = 250 lbs. or say $\frac{1}{5}$ th of a ton, which, at Rs. 60 per ton, equals Rs. 6-8, plus cost of application Rs. 10. Total cost Rs. 16-8, giving at $4\frac{1}{2}\%$ nitrogen, about $11\frac{1}{4}$ lbs. only, at a cost of Re. 1-7-5 per lb.

Perhaps friend "Poonac" will reconsider his "very obvious conclusion." For, at a lower price, (taking his figures for cost as correct,) cattle manure gives him 92 lbs. of nitrogen *versus* only $11\frac{1}{4}$ from Poonac!

I may state here that I cannot help thinking that "Poonac" goes wrong both in valuing the manure at so low a cost as one rupee per ton, and in his estimates of cost of application. It would be interesting to hear how he arrived at his results. A more usual price is Rs. 4 a ton, though in some places it goes as high as Rs. 8 a ton. Anyway, he should exercise a great deal of caution in framing his estimates and obtain the advice of some more experienced neighbour. More information on this point would be interesting to

A DOUBTER.

THE ANTI-BUG PARASITE?

DEAR MR. EDITOR,—In answer to your request, which evidently applies to me, I have much pleasure in relating my experience on the above subject. It is with great diffidence, and a large query, as you may observe, that I name the pest-destroyer as above, for what its proper name is I leave it to those who have a knowledge of such things to decide.

This account will, I trust, promote a discussion in your valued columns on a subject which, as it at present appears, may deeply concern the planting community in general.

Some six months or more ago, bug of the black variety was only too distressingly evident on certain blocks of coffee on my estate, and I had experienced a proportionate amount of worry, by its persistent ravages, when one day (as I was observing with fast waning interest the conduct of certain common lady-birds on some bug-stricken coffee to which I had brought them to see whether or not they would cultivate a taste for our black enemy) I was attracted by patches of what at first appeared to be the rather discolored remains of the web—I shall call it, for want of a proper name!—of the green bug. On further examination, I found this substance somewhat dustily covering the stems and leaves of the coffee trees and only where the black-bug was located. On and round every bug-cell was a thicker and more solid-looking accumulation of the substance, and I found that in every instance where the parasite either covered or surrounded a bug-cell the contents of the cell were dead. A further careful scrutiny of every patch of black-bug disclosed its accompanying destroyer, in the shape of this parasitic growth, doing its work thoroughly and perfectly. For the benefit of my brother planters who may not have noticed the presence of this fungus, or parasite—or whatever it is—I will try and describe it. Where thickest to the naked eye it resembles flour made into a dull, not shiny, paste, which has turned *slightly* green in colour; where thin it seems like an irregular dusting of dirty flour, and in some places it even seems like a dirty buff-colored lime-wash. The above, though a very poor description, should enable anyone to recognise this perhaps very valuable parasitic bug-destroyer.

I imagine it to be a vegetable growth, and it seems to spread rapidly, and what is a most important recommendation—it *only* *harms the pest*; for, where it has done its work, an examination of the stem or leaf under it shows the stem or leaf to be of a fresher green than where the bug has not been located. Another strong argument in favour of this destroyer is that it is a remedy supplied by *nature*; and let us hope it will prove itself to be such in every sense of the word, and *not* another pest in disguise!

Time will show which it is; but at present I believe it to be

the *most complete* remedy I have ever seen used against that formidable enemy the black-bug.

It seems evident, from examinations made under the microscope in conjunction with some planting friends near Kullakamby not long ago, that the bug is killed by the parasitic growth excluding the light and air necessary to the life of the pest. I would ask those friends to be so kind as to publish their own experiences on a subject of such general planting interest.

COFFEE.

North Wynaad.

We learn that the new "Coorg clearings" in this district are coming in extremely well, and promise to more than justify the sanguine hopes held by their proprietors.

Local prices.

A Nilgiri planter complains, that despite the striking experiences detailed by Wynaad planters recently, he can't obtain anything higher this year than Rs. 12 per bushel for well-cured *parchment* at the works, against the Rs. 11-1-0 obtained by "Wynadien" for half ripe cherry on the estates.

The New Hebrides.

This group of islands is quickly making a name for itself as a profitable field for coffee planting, as we have already noted in these pages. Leaf-disease and borer being still unknown, the yields reported seem fabulous to the younger generation who knew not the cropping powers of coffee in the good old days. The islands are in the Pacific, off Australia, and are virtually independent, being claimed alike by England and France. British and Australian capital has been freely invested, and though the labour question has yet to be satisfactorily solved, there are many worse places for coffee planting than the New Hebrides. A sample of coffee grown there was recently sent to Ceylon, where it was valued at 90s. per cwt. The bean was small, but regular.

The berry in Upper India.

It is curious to note how soon planters, after a short absence from a district or country, get out of all touch of what happens therein. A writer in some Calcutta exchanges, who left South India some twelve years or so ago, lately affirmed that coffee disease was extinct in South India, and that consequently the pest might be absolutely disregarded in Upper India. How utterly wrong such a statement is, is almost needless to point out, except

for the benefit of our Assam and Cachar readers. La however, estimates, which were formerly based on average crop of $7\frac{1}{2}$ cwts., have come down to more reasonable figures. With manuring three times a year irrigation facilities to help out a dry season, $4\frac{1}{2}$ cwt. acre are not, perhaps, too much to expect.

Manure mixtures.

It is not a little absurd to men talking of adopting this or that mixture, usually known by the names of the men who picked a few good crops following its application, without the least idea—save by reference to their files—of the composition of the mixture. A "mixture" may in particular cases be exactly the thing the coffee requires, another plantation, even if only a few miles off, through difference of previous treatment and soil, require something altogether different. Chemicals, as distinct from artificials, are often used in these mixtures, and in touch with ignorance of the insoluble combinations and waste which occurs from such combination, especially if more than a day or so elapses—as must invariably be the case—before application to the field. In the districts where heavy rain fall is the rule, the bulk of the nitrogen used is certainly not be in any less soluble a form than pod fish or dried blood. At special times, after the heavy rains are over, or some months before they begin, a reserve of nitrate of soda or the less soluble and cheaper (reckoning price per pound of nitrogen) sulphate of ammonia may be used with advantage, if the trees demand it. If applied at other seasons there will be an enormous waste. By way, if the object of the chemical manures is, as is usually the case, to give the trees an immediate fillip, the best way the manure is distributed among the feeding roots of the trees, the quicker will be their action and the less waste there will be from subsequent rain washing away the unabsorbed balance. It may be taken as an axiom that the more concentrated the manure used, the greater the need for its diffusion and thorough incorporation with the soil.

The coffee campaign.

We believe it would be an excellent thing if the U. P. A. v through its London representative, to address the U. P. Grocers' Association of England with a view to bring producers and consumers a step nearer each other. The Grocers' Association is a very powerful body indeed, and if it were made clear, as it undoubtedly could easily be done, that it would be much to their advantage to only sell coffee instead of the adulterated abominations they dispose of, a great obstacle to the free consumption of coffee *au naturel* would be removed. It could be arranged without difficulty that the grocers, or such of them as were willing to meet half way, would be granted facilities for purchasing the material direct, or all but direct, from the producers. The prices would be mutually most satisfactory, planters and grocers alike sharing in the profits now made by the middlemen, the brokers.

If this policy of persuasion is not found to act, then measures of semi-coercion, already set forth in our columns, must be resorted to.

The first step undoubtedly is to appoint a small strong committee to devise the plan of action. Once

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Richy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Un-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to Common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 10 ft. by 3 ft.

Quotations and further particulars will be furnished by our Callicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

decided upon, a fund can be raised to any desired amount. until planters have a strong and capable committee to present them, and know approximately on what lines the campaign is to be worked, they will naturally be chary of their subscriptions. The movement has now developed to the extent, we take it, of practically all concerned agreeing that a decided effort should be made to push the consumption of our coffee. Brazil has led the way, it behoves us to overtake our rival before it is too late. Wherefore the sooner a committee is appointed the better.

London market. The continued heavy receipts in Rio and Santos have had, says the *Produce Markets Review* in its issue of 20th ult., a further depressing effect upon prices in the terminal market, and quotations have given way from day to day until yesterday, when there was a slight reaction. The fall has produced a much larger business, and the feeling is growing that with every probability of reduced receipts, a reaction will set in, and that prices are quite as low as they are likely to be. In the case of Java coffee, the business transacted is still very much of the same old character, as supplies continue to come forward very freely, and it is felt that the present range of prices can hardly be maintained, when there is a greater variety to select from. Plantation Ceylon is likely to continue so scarce this season that the enormous prices recently paid there are not only been maintained but, an advance of 1s. has been established. East Indian has also sold at exceedingly high prices, but as the arrivals recently have been heavier, and the auctions next week will most likely be larger than before this year, some decline may be looked for. Of Central American sorts, coloury Guatemala has sold rather dear, but Costa Rica has maintained its value. The common grades show no change.

BEES AND THE FERTILISATION OF THE COFFEE BLOSSOM.

THE subject of the fertilisation of coffee blossom is, I trust, of sufficient importance to make it unnecessary for me to offer any apology for returning to a friendly discussion of the question with your original correspondent with a view to its more thorough elucidation.

With reference to the tree which I mentioned as being covered with honey-combs twice a year, I may state that I believe the bees were in the habit, as your correspondent suggests, of visiting it years before there was any coffee in the district; but one would have thought from the reasons enumerated in your impression of the 9th ultimo for

imagining a coffee estate to be about the last place to find bees in large numbers, viz.: that the coffee plant is in flower for a very short period, and with the exception of this tree there is very little that the bees can get honey from, the shade trees even not flowering more than once a year—one would fancy, I say, from all this that the bees would have forsaken the place when the district was cleared and planted with coffee, for being converted into a coffee estate there would be very little for the bees to get honey from, &c. If your correspondent had said that the lack of suitable quarters for the bees to hive in was against their occurring in large numbers on a coffee estate, it would have been very different, but it will be noticed that this was not given as a reason for “a coffee estate being about the last place to find bees in large numbers.”

However all this is beside the main question as to how the coffee blossom is fertilised. In the opinion of your (original) correspondent it is for the most part self-fertilising. He says:—“The flowers are in dense masses, so that the slightest puff of wind would blow the pollen from the anthers with the probability of this pollen catching on to one of the *adjoining stigmas*.” (*Italics are mine.*) But let me point out before I proceed further—and this will make clear my reason for underscoring the words ‘adjoining stigmas’ in the above quotation—that the pollen from the anthers of a flower *must reach the stigma of the same flower* before it can be said to be ‘self-fertilised,’ for if the pollen of one flower reached the stigma of another flower either contiguous to it or far removed—and it must be admitted that this is just as likely to happen in the case put by your correspondent as for pollen from the anthers of a flower to be transferred to the stigma of the same flower—it matters little by what agency the transfer is effected, it would be cross-fertilisation.

But in works on Botany ‘Self-fertilisation,’ appears to me, has a more restricted meaning. It is restricted to flowers in which special arrangements exist to secure self-fertilisation such as the cleistogamous or closed flowers, the interiors of which are utterly inaccessible to insects; and others in which the anthers bend over the stigmas and shed their pollen on them, &c. This only occurs in low degraded types of flowers such as Groundsel and Shepherd’s purse, &c. (Grant Allen: *Story of the Plants*. Rev. Henslow: *Origin of Floral Structures*.) Now coffee cannot surely be classed amongst degraded types of this description, for “we know,” as Wallace says in his work “*Darwinism*,” “that when petals cease to be required for the attraction of insects, they rapidly diminish in size, lose their bright colour or almost wholly disappear,” and this has certainly not happened in the case of coffee.

But I had forgotten. Your correspondent does not hold that the coffee blossom is fertilised by any movement on the part of the anthers or stigmas or any special arrangement about the flower, but that it is effected for the most part by the agency of the wind. Now just let us examine for a moment the characteristics of wind-fertilised plants and see if we can find any good grounds for saying that coffee blossom must be largely fertilised by wind agency. Grant Allen says (and other authorities agree with him) “Bright-coloured petals and stores of honey will not serve to allure the unconscious breeze; such delicate adjustments of part to part as we saw in the case of bee and blossom will no longer be serviceable. What will most be needed now is

quantities of pollen; and that pollen must hang out in such a way from the cup as to be easily dislodged by passing breezes. Hence wind-fertilised flowers differ from insect-fertilised in the following particulars. They have never brilliant corollas or calyxes. The stamens are usually very numerous; they hang out freely on long stalks or filaments; and they quiver in the wind with the slightest movement. On the other hand the stigmas are feathery and protrude far from the flower, so as to catch every passing grain of pollen. More frequently than among the insect-fertilised section, the sexes are separated on different plants or isolated in distinct masses on neighbouring branches. But numerous devices occur to prevent self-fertilisation." Note that even in the case of flowers specialised for wind-fertilisation, devices exist to prevent self-fertilisation. Now the coffee blossom possesses none of the characteristics of wind-fertilised flowers; and I am convinced in my own mind that the pollen is not dry and powdery enough to be easily detached from the anthers and blown about by every passing puff of air.

To my mind the very fact that the coffee blossom is attractive looking, possesses a scent, secretes nectar, and above all is visited by bees and other insects directly it opens, is sufficient proof that it is entomophilous; for we read that the degraded types of wind and self-fertilised blossom are the result of the neglect of insects to visit them, and they have lost all unnecessary parts; and as I said in my previous article, if the coffee blossom were capable of wind-fertilisation, Natural Selection would have taken care that it had no useless appendages. The very fact that flowers are visited by bees is a sufficiently convincing proof that they are entomophilous to Grant Allen, who in speaking of willows says that one can easily satisfy one's self that they are insect-fertilised by standing under one in early spring when one will hear all the branches alive with the buzzing of bees: but I suppose Mr. Allen is not a sufficient practical authority for your correspondent. However he is accepted as one by Mr. A. R. Wallace, the Naturalist.

I will now state how I think the coffee blossom is fertilised. I think the pistil and stamens are so placed as to preclude self-fertilisation. When the blossom opens the stamens fall away from the stigma which protrudes far out beyond the stamens. The stigma is two-lobed and shaped like a Y with the style. It appears to me that when the bee inserts its proboscis into the nectary it gets covered with pollen, and when removing its head it knocks against the under sides of the lobes of the stigma which prevents self-fertilization, and when it visits another flower it knocks against the top surface of the stigma and thus cross-fertilises it. I have watched a bee at work, and this is the idea I have formed of the way in which the blossom is fertilised.

Your correspondent makes a great point of coffee, as he says, coming up twice to seed. They do so to the superficial observer, but I think if plants grown in a nursery prepared exactly alike throughout were critically examined they would be found to differ slightly. Do not some seeds germinate sooner and some plants make better growth than others although equally nourished? There would appear to be no doubt that plants differ in constitution. This would seem to be the reason why there are so many failures as the plants are unsuited to the environment that suited

their parents. If conditions could be so altered as to plants that differed from their parents, many differences would be apparent which are now not noted because plants not suited to the old conditions usually die out. It accounts for the persistence of a species.

To come to your correspondent's quotation, I may say that I think it refers to what is observed in garden green house cultivation. Results are obtained in green houses by the manipulation of a camel's hair brush that are of much slower attainment in a state of nature. It seems to have missed the fact that the part underscored by him is advice to *hybridisers* and *raisers of seedlings*. The only way to prevent cross-fertilisation is by excluding bees, and this is easily done in a green house. I am not satisfied that close-fertilisation is the same as self-fertilisation, even if it is, it may mean that under forced cultivation flowers lend themselves to close-fertilisation and that a hybridiser should arm himself with a camel's hair brush and take advantage of this.

H. G. P.

THE BRAZIL COFFEE CROPS.

VARIOUS have been the estimates formed within the last six months of the size of the current crops of Rio and Santos coffee for the year 1896-97, they together having oscillated between 6,000,000 bags and 8,000,000 bags; and although the present season will not be entirely over until July next when another campaign begins, the probable outturn may be pretty accurately gauged. The maximum amount of the production of Brazil coffee for this year, there says the *Grocer*, turns out to be nearest the truth, and is distinguished by being the largest on record. The actual figures are given by Messrs. W. H. CROSSMAN & BROTHER, of New York, who reckon the yield at 8,500,000 bags, made up by 3,750,000 bags Rio and 4,750,000 bags Santos; and those authorities who pinned their faith to the estimate of 6,000,000 bags, or thereabouts, and speculated accordingly must now acknowledge that they were seriously in error. The growth and development of the Brazilian coffee crops of late years has surpassed all calculations, as will be seen by the following statements. First, the joint receipts of Rio and Santos at the shipping ports for the seven months ended the 29th ult. were 6,323,000 bags, in striking contrast with 4,349,000 bags in 1895-96, 4,714,000 bags in the preceding year, and 3,045,000 bags in 1893-94. Secondly, the total shipments from these places to Europe and the United States in the same period have been 5,377,000 bags, opposed to 3,926,000 bags last year, 4,243,000 bags in 1894-95, and 2,807,000 bags in the former season. And thirdly, the stock on hand there at the end of January, 1897, reached 849,000 bags, in comparison with the diminutive quantities of 587,000 bags, 485,000 bags and 318,000 bags respectively in the other years at the corresponding date.

To render the view of the coming crops of Brazil coffee more complete, it should be added that what are called "outside" crops, apart from Rio and Santos, such as are raised in Victoria—Barrage and Ceara, should be included in the general estimates of the quantities harvested, and these are reckoned to produce, on the average, 5,400,000 bags, so that the aggregate supply of Brazil described for the year 1896-97 is not likely to fall far short of 14,000,000 bags. It is thus quite clear that the incoming crop is much heavier than first predicted, and this tends to shake one's confidence in the reports that are circulated from time to time by parties interested in keeping up prices to the highest point. Often we hear of frost in July, too much rain in August, drought in October, heavy rain in November, drought again in December, and too much rain due in January, till the ordinary observer of events in connection with coffee cultivation in the Brazils gets bewildered, and is seldom that he is adopting the right course for either a rise or fall in market quotations. As Messrs. Crossman observe, "That the speculators in London and in Europe who are heavily involved should, through their branch houses, foster these reports, can

re easily understood, but it taxes the intelligence of the coffee trade generally a little too heavily to try to force upon them the idea that 'drought' and 'rains' can cause damage at one and the same time, and to believe that young and inexperienced firms in Brazil should possess a more accurate knowledge of conditions throughout the country there than the old and recognised leading firms who have from fifty to sixty years' experience in the same business, and whose forecasts concerning the crops have proved exceptionally correct when figuring on crop yields months before the season really commences."

A decline in prices has consequently been no more than what might have reasonably been expected, and that this has not yet inflicted any great hardship on the growers or producers, considering that they are still making 100 per cent. profit on coffee cultivation, is proved by the fact that there is an enormous increase in the acreage of coffee plantations in the State of Sao Paulo, in Santos, and that the rearing of the plant appears to be extending in all parts of Central and South America. The days when planters in those regions could obtain a return of 150 per cent. to 200 per cent. for their capital and labour in bringing the coffee berry to perfection are evidently gone for the present, and they may prepare themselves for an interval, more or less prolonged, of lower rates. Since the opening of the year there has been a sensible reduction of about 3s. per cwt. in the value of "futures," as Santos of good quality which was worth 53s. to 55s. 6d. for immediate and forward deliveries, has recently been offering at 50s. 6d. to 52s. 6d.; and as the downward movement spreads, so are quotations for the higher-class descriptions from East India and other coffee liable to undergo some reduction—a result which would be most welcome to home-trade buyers of the article in this country.

THE MANAGEMENT OF SOILS UNDER COFFEE, &c., IN THE MADRAS PRESIDENCY: A PRIZE ESSAY.

By THOMAS CLARKE, ESQ., TENCASY, TINNEVELLY.

The following interesting remarks on the cultivation of coffee gained the prize given by the Madras Agricultural Exhibition in 1883. We reprint at the desire of a correspondent and by the kind permission of the Madras Agri-Horticultural Society, trusting our readers will find it of practical value.—ED.]

I.

How to maintain the fertility of the soil is a question which is every year gathering greater force all over the world, and to which the answer is happily growing every year more distinct, as the researches of the chemist, backed up by the experiments of the practical farmer, are bringing science to the assistance of agriculture. Cultivators of coffee have not, however, hitherto reaped the full benefit of the advance in scientific agriculture, because, working under conditions somewhat special, they have not yet sufficiently tested theory by experiment, but have been too content either to run in the old groove of tradition, or else to accept conclusions arrived at under different conditions, as equally applicable to their needs.

Profitable manuring.

"Off course," says the sleeping partner in a coffee estate, whose remittances from his formerly productive property are gradually growing smaller, "you must return to the soil the plant food you remove in your crops." No doubt; but the working planter finds he must do this so as to show a profit on the operation and here comes the difficulty. As an agricultural chemist puts it:—"In theory we may convert any defective soil into a fertile and complete one by the addition, in proper quantities, of those materials it is deficient in; and on a small scale we may carry out the theory in practice. For instance we may make a garden on any kind of soil, and, by the addition of proper materials, soon prepare a fertile mould capable of producing, in luxuriance, every kind of plant whose growth the climate will permit. But in practice, on a large scale, as on the land of our farms, the case is very different. The alteration we can effect in the character of the land in this manner is limited by considerations of cost; the question in these cases is, not what can be done, but what can be done to pay." And when the planter begins to work on his theories, subject to this limit of £ s. d., he very soon finds that the conditions under which he is working, to a great extent,

forbid his taking advantage of the experience—accumulated for years in European agriculture, and that he must start in a comparatively unworked field, and ascertain for himself what can be done to pay. The enterprise in which he is engaged is a young and comparatively limited one, schools of agriculture do not concern themselves with it and there are no wealthy individuals to undertake disinterested experiments for the general good as in England. He has kept cattle for manure at great cost, and they have kept his coffee in good heart and paid well till two or three successive short crops from leaf-disease or some unknown cause have forced him to lower his expenditure and sell off his stock. He then consulted an agricultural chemist, who told him that by substituting bones and poonac for his cattle manure he can supply the same elements of plant food to his land at less than half the cost, and without any great expense for application. He has tried that successfully for a time, but his coffee has seemed to exhaust itself in its efforts to bear, and there has come a bad season, he has no crop in return for his heavy expenditure on artificial manure, his resources are exhausted, and he sees nothing for it but to acquiesce in the gradual defertilization for his soil, taking from it what he can get, but laying out nothing upon it.

Experimental fields.

If this state represents the present condition to the coffee enterprise, and any remedy is to be found, it must be by the combination of all concerned to ascertain, by careful experiment, the best method of applying to the cultivation of hill sides in a tropical climate the principles of scientific agriculture. In their associations throughout the country planters have, ready-formed, an organization, which, with a little assistance and direction from an intelligently worked agricultural department of the Government, might be made to do the work of a Cirencester and a Rothamstead and so diffuse knowledge, which would probably save from extinction a most important industry. An experimental field in each district worked, under the direction of a central authority, by which all results should be carefully collected and circulated, would not only bring its results under the notice of planters in all parts of the country, but would save much time by the division of labour. The initiation and direction of such a scheme must be undertaken by the Government, also probably the scientific advice and analyses required, the cost of working should be borne by the planters, but there is no reason why the experimental fields, once started, should not be self-supporting. I will illustrate by an instance the benefit that might be expected from such systematic experiments, and which cannot be obtained in any other way. Mr. Gibson, in his Agricultural Chemistry, discussing the proper respective uses of farm-yard and artificial manures, makes the following statement:—"The manure produced on a farm should contain all the fertilizing elements extracted from the land by the crops raised upon it, with the exception of those contained in the grain, cattle, or other produce sold of the farm. Hence if the manure made on the farm has been properly preserved, we can return to the land in this shape all the materials borrowed from it for the growth of our crops, except those carried away in the manner above noticed. To make good this deficiency we should employ artificial manures; since in these we possess a ready and convenient means of restoring to the soil those more essential constituents, permanently removed from it by the produce sent to market." Now, if it is desirable in England to restore to the soil the materials removed in the produce sent to market, by means of artificial manures, how much more so in the case of land, situated as most coffee estates are. Yet, planters as a rule look upon artificial manures as dangerous stimulants, which they use only under pressure of circumstances, namely, the prohibitive cost of cattle manure. There is evidently room here for profitable experiment.

It is evident from what has been said that we are not yet in a position to lay down the law dogmatically as to the proper treatment of soils under coffee in order to maintain their fertility, but it is a subject that well repays looking into even in the light of our present knowledge, since a discovery, only of our ignorance in the matter, is a long step in the right direction.

The fertility of soils. The fertility of a soil depends upon two conditions, namely, its chemical composition and its mechanical texture, and if we find a fertile soil losing its fertility, we may safely conclude that it is in consequence of a change it has undergone in respect of one or both of these qualities. Let us, therefore, try to arrive at some idea of the extent to which these changes are going on in our coffee soils.

First the change in chemical composition, in other words, the loss

of fertilizing material. We have noticed above the distinction drawn by Mr. Gibson between constituents of the soil removed by produce sent to market and those removed by produce consumed on the farm and returned to the soil in the shape of farm-yard manure. In the case of land under coffee we shall endeavour to maintain a somewhat similar distinction, except that the constituents removed otherwise than by crop being not utilized in any way, we shall designate as waste. There are no data available to make anything like accuracy possible in such an inquiry, but I shall have accomplished my object if I can show that the amount of waste is a matter worthy of serious attention, and its prevention a proper subject for systematic experiment such as I have suggested.

Loss by cropping. Mr. Hughes in his report to the Ceylon Planters' Association of his visit to Ceylon in 1877, included an analysis of the seed, pulp and leaf removed from an acre of coffee in one year, but his result is, I am persuaded, very much vitiated by his excessively low calculation of the amount of leaf lost in a year by each tree. He takes 200 as the average number of leaves lost. I find 200 is about the average number of leaves carried by each primary branch with its offshoots, and as a tree with ten primaries is not a large one, I do not think 2,000 leaves at all too high an estimate to make of the average number of leaves dropped by each tree in a year. Moreover Mr. Hughes' calculation was meant to be for a crop of 7 cwts. an acre, but he has taken 7 cwts of parchment, which would be equivalent to about 5 cwts. 8 lb. of clean coffee. Adopting Mr. Hughes' analysis, and applying it to a crop of 3 cwts. of clean coffee per acre, a loss of 2,000 leaves from each one of 1,200 trees, the constituents drawn from the soil each year will be as follows:—

	SEED.	PULP.	LEAF.	TOTAL.
	3 cwts. clean coffee =429·68 lb. Parchment.	Fresh Pulp 465·71 lb.	Partially Dried 2,400,000 Leaves =2,470 lb.	Weight = 3365·39 lb.
	lb.	lb.	lb.	lb.
Water ...	57·16	364·83	240·00	661·99

Carbonic Acid ...	4·00	1·85	24·00	29·85
Total ...	14·18	8·38	188·00	210·56

I imagine most planters will be astonished to find how heavy is the drain caused by the loss of leaf upon the resources of their soil, and the injury caused by leaf disease becomes easily understood in the light of these figures. If we disregard the water and the organic matter other than nitrogen, we find that, whereas a crop of 3 cwts. per acre carries away but 20½ lb. of valuable constituents, the pulp of the same crop and the leaves dropped in the year account for no less than 263 lb., which, unless returned to the soil, must be set down as waste. It may be said that the leaves are returned to the soil, in as much as they decay where they fall, and become mingled with the soil. To a limited extent, no doubt, that is so, more especially in coffee grown under shade; but, unless some measures are taken to keep them, by far the greater part are carried by the wind to the nearest stream, and thence washed away with the first rain.

There remain still three channels for the exhaustion of the riches

of the soil, viz., prunings, weeds, and wash, but it is not easy to estimate the amount of loss due to them. Prunings, even when are not buried as they should be, doubtless lie to a great extent where they fall, and are not carried away by the wind as is the case with leaves; and the loss by weeds must vary widely on different estates so that I shall not attempt to reduce these two items to figures.

Loss by wash. But the greater despoiler is wash. mischief goes on quietly and unobserved even during a heavy shower, so that we are hardly conscious of the amount of our loss. To get some idea of what this is, let us suppose that one inch of the surface soil is carried away in the first year after an estate is opened. Taking Mr. Hughes' analysis of good coffee soil in Badulla as an approach to the composition of the uppermost inch of soil, we find that the constituents lost each year in one-fifth of an inch of surface soil would be as follows:

Water ...	3,371
(b) Organic matter and combined water ...	5,111
Oxides of iron and traces of manganese ...	2,871
Alumina ...	3,801
Lime ...	81
Magnesia ...	71
Potash ...	71
Soda ...	Trace
Phosphoric acid ...	81
Sulphuric acid ...	31
Chlorine and carbonic acid ...	1,251
Silica soluble in alkali ...	33,031
Insoluble silicates ...	33,031
Total ...	49,801

(b) Containing nitrogen ... 11

The sample analysed by Mr. Hughes was taken from a particularly good soil, which had been thirty-five years in coffee, with manure, and had been surface-drained only three years before the sample was taken. The proportion of phosphoric acid is unusually large, but the other important elements of a fertile soil, viz., potash, and nitrogen, are not present in larger quantities than might reasonably be expected in the uppermost inch of soil of a clearing, which would include all the ashes after the burn. At the same time I am afraid that a loss of one-fifth of an inch of soil each year, for the first five years in the life of a coffee estate, is a rate below the average; and I am sure that, on undrained clearings, the loss must reach three or four times that amount.

Total loss. We have thus arrived at a rough, perhaps, for our purpose sufficiently accurate estimate of the constituents removed per acre from soil under coffee in crop, leaf, and wash, and we cannot but be struck by the proportion which the elements contained in the crop bear to those lost in waste. If we tabulate the four most important elements by side, we shall see this more plainly.

	Crop.			Waste.		
	Seed.	Pulp.	Total.	Leaf.	Wash.	Total.
	lb.	lb.	lb.	lb.	lb.	lb.
Nitrogen ...	6·30	1·53	17·83	66·00	112·00	178·00
Potash ...	5·81	4·11	9·92	52·00	45·00	97·00
Lime ...	·82	·82	1·64	42·00	83·00	125·00
Phosphoric acid... ..	1·15	·38	1·53	23·00	74·00	97·00
Total ...	14·08	6·84	20·92	169·00	322·00	491·00

It is almost appalling to consider that each year as much valuable matter is carried away as would be required to produce several such crops as we now look upon as an average yield; yet I shall escape from the conclusion. So little has this been recognized in 1879 Mr. Hughes wrote to the Ceylon Planters' Association: "If the pulp is not returned, and the leaves are allowed to be carried away till they choke the drains and cause extra damage by rotting still if the above figures are accepted, coffee is not so exhausted

ordinary crop of turnips or wheat." That this is the case, if we only the crop into account, the following table will show:—

	Coffee.	Wheat.	Turnips.	Beans.	Maize.
	3 cwt. Bean 93 lb. Parch- ment skin, 465 lb. Pulp.	28 Bushels Grain, 18 cwt. Straw.	20 Tons Bulbs, 4 tons Tops.	35 Bushels Grain, 1 ton Straw.	48 Bushels Grain, 1½ tons Straw.
	lb.	lb.	lb.	lb.	lb.
Wash ...	9.92	22	140	64	56
Manure ...	1.64	8	90	25	13
Phosphoric acid ...	1.53	20	45	16	31

But, if we add the waste in the case of coffee, and deduct in the case of the other crops, the amount returned to the land, the result will be very different.

Here then lies the whole secret of the progressive defertilization of coffee soils. We have heard, and read, of the established principle in Europe of returning to the soil in manure the constituents removed by the crop, and, ignoring the different conditions, have complacently imagined that by so doing here we were maintaining the fertility of our soil. We are like the Australian Colonists, constructing a constitution on the model of that of England, and expecting similar results, without taking into account the influence that an aristocracy, which cannot be imported, has had on English political history. True, we have recognized wash so far as to see the necessity of some surface drains; but where is the estate on which wash has been completely prevented, and where is the planter who, if he could return every year the chief constituents of his crop to the soil, would not think he was treating his estate most liberally, in spite of the loss of perhaps ten times that amount in surface soil? Some idea of the importance of the subject may be gathered from the fact that the above figures for waste, by wash and leaf, represent a loss in nitrogen alone on the coffee, tea, and cinchona plantations of the Madras Presidency, which it would take an annual expenditure of more than Rs. 28,70,000 to replace by manure.

To prevent wash. It is evident that the first, and by far the most important, part of any action for maintaining the fertility of land under coffee, must be the prevention of this enormous waste, and that until this is done, we are only deceiving ourselves in pretending to return to the soil what we take from it. On most estates something has been done by surface drains, terracing, wash-holes, and forking, to reduce the loss by wash, and on many it has been very much lessened, but I doubt if it has been anywhere completely overcome, except on flat land. I know of no other method of combating it, but I believe, by a combination of these operations, it may be entirely obviated. In opening new land, if the importance of the surface soil were more fully recognized, measures to preserve it would be the first to occupy the attention of the planter, and though the size of clearings opened in the season would be very much limited the gain in the long run would be immense.

I shall endeavour to prove the economic value of such works by summing what seems a maximum expenditure upon them, and balancing that against the value of the principal elements contained in any estimate of waste; but only by actual experiment is it possible to demonstrate, first that waste can be altogether prevented, and second that it would pay to prevent it.

Drainage. Surface draining should be the first work undertaken on a clearing. The drains should be cut across the face of the hill at a gradient of one in ten to one in twelve. The distance between them must depend to some extent on the nature of the ground, from 40 to 50 feet is a common interval, but it is far too great. The cost of drains at 50 feet interval is about Rs. 20 per acre. Three, or even four, times this amount could be well spent, but the amount of labour and supervision required for tracing and cutting drains at a time when there is plenty of other work to be done to prepare the land for planting with the

first rains generally lead to their postponement to a more convenient season. If there is no other alternative, the size of the clearing should always give way to the importance of draining.

Complete terracing is not often possible on the rough ground, closely studded with boulders, which indicates the best coffee land. On a new clearing I should think it can never be carried out. On old coffee land where the roots have become exposed by long continued ravages of wash, stones are sometimes collected to form a sort of miniature terrace below each tree. These divert the flow of water, but do not prevent it, and would, therefore, not form part of a scheme for abolishing wash.

Wash-holes are pits three to five feet long by two feet broad and one and a half feet deep, cut across the slope of the hill in the intervals between the trees. In a well-drained field they do immense service by helping the rain to penetrate the soil, as well as by acting as catch drains. They also prevent the waste of fallen leaves. A very little alteration will collect all the leaves in them, where they decay, protected from the wind, and may be spread over the ground and forked in when convenient. Prunings cut up small may also be thus preserved. Wash-holes can be cut for about Rs. 15 per acre.

Forking falls more properly under the head of measures for improving the mechanical condition of the land, but it also bears on drainage, inasmuch as it stands to reason that, by allowing the rain to penetrate the soil, we destroy its power of carrying away material from the surface. At the same time it would be very rash to attempt forking except on well-drained land. The cost is from Rs. 3 to Rs. 12 according to the condition of the soil at the time.

Draining vs. manuring. Let us assume, then, that, by means of surface drains at intervals of 12 to 15 feet, costing, say, Rs. 80 per acre, and wash-holes costing, say, Rs. 20 per acre, together with twice a year loosening the soil, and forking in all the leaves and silt collected in drains, and wash-holes, for which we may allow Rs. 13 per annum, let us assume, I say, that by these measures taken in time, we have saved annually the 491 lbs. of valuable material which we have set down above as waste. We have then only to calculate the money equivalent of these 491 lb. to ascertain the financial aspect of our operations. Taking 1,700 trees to the acre, a dressing of 10 lb. cattle manure* and 1 lb. of rape cake per tree would contain about an equal amount of valuable materials thus:—

* Not having at hand an analysis of cattle manure as usually produced on estates, I have used the following analysis of moderately rotten farm-yard manure by Professor Wolff. Any correction necessary would only increase the balance in favour of drainage:—

Water	...	...	...	75.0
(a) Organic Matter	...	...	...	19.2
Ash	...	...	...	5.8
Total...				100.0
Potash	...	...	...	63
Soda	...	...	...	19
Lime	...	...	...	70
Magnesia	...	...	...	18
Phosphoric Acid	...	...	...	26
Sulphuric Acid	...	...	...	16
Chlorine	...	...	...	19
Silica	...	...	...	125
(a) Containing	...	...	...	50
According to Mr. Hughes' analysis 100 parts contain				
Nitrogen	...	...	...	5½
Phosphoric acid	...	...	...	2½
Potash	...	...	...	2

(Vide Hughes' Report, p. 107.)

	Waste.	Cattle Manure 17,000lb. and Rape Cake 1,700lb.
	lb.	lb.
Nitrogen	178	174½
Potash	97	141
Lime	125	191
Phosphoric Acid	97	86.7

The cost of cattle manure including application I take at Rs. 38 per acre for 10 lb. per tree. The value of the rape cake, Rs. 53 per ton at the coast, say Rs. 73 including transit and application, would be Rs. 56.

The Dr. and Cr. account would then stand thus:—

First year.	Rs.	First year.	Rs.
To cost of drains and wash holes ...	100	By value of manure saved...	94
Second year.		Second year.	
To forking twice ...	10	By value of manure saved...	94
Interest, say ...	10		
To balance in favor of drainage			
age ...	68		
Total ...	188	Total ...	188

Showing a large profit in favour of the drainage in the second and every succeeding year.

(To be continued.)

TEA.

Pruning and preparation of tea.

Our worthy contemporary, the *Ceylon Observer*, has barely finished its interesting discussion regarding the manuring of tea, ere it starts a new one as equally valuable on this subject heading. The first batch of letters are fairly unanimous that manuring has not affected flavour in any appreciable degree and cannot therefore be said to be the cause of the present inferiority of Ceylon to Indian teas. Heavy pruning is a more fruitful cause of low prices, but the general conclusion seems to be that Indian leaf is a great deal more carefully plucked than before, while in Ceylon quantity is still aimed at.

Light in withering.

We are told, on weighty authority, that the major portion of the flavour and aroma of tea is due to its essential oil. It is present to a certain degree in the raw leaf fresh from the pluckers, but its subsequent development is hindered or furthered in the stages of withering and fermentation. The question every practical tea-maker must have asked himself, is, what are best conditions for this development? And does the most fragrant smelling wither produce the most fragrant tea, other things being equal? If so, we can say without hesitation, that a moderate degree of warmth is essential. A dark, damp withering room will never, even in the driest weather, produce anything but a musty-smelling wither. A light and warm shed seems to bring out a markedly fragrant wither, while a dark but warm shed (such as are commonly found above the dryers) gives at best a but slightly fragrant wither. Thus far the conclusion seems obvious, that light and warmth are essential for a full development of essential oil in the wither. Have any of our readers proceeded a step further, and tested the quality of the tea from the respective withers? It would be extremely interesting to note their conclusions. Discussion on such points of practical interest cannot fail to be of benefit.

Action of tea juice.

We are asked whether the action of tea juice on the metal parts of a

roller can have any deleterious action on the quality of tea. We are not prepared to give an answer to this question off-hand, but would merely point out the undoubted oxydising action of the juice on the brass lining, if allowed to stay on it for some time. There must infallibly result from this a combination of certain of the constituents of the juice with the brass. This compound must find its way into the tea. As to how far its action affects the flavour is another question, and to be only solved by experts in conjunction with most careful comparative experiments at the factory. It might be perhaps advisable to have the brass replaced by thick enamelled iron. We have been further asked if there is any danger in allowing the tea to pass from the roll, in such cases where hard rolling is deemed advisable, to be caught in a metal receiver, either brass or zinc. Our reply must be identical with that already expressed with regard to the roller, save that the action of zinc is more marked than that on brass. The remedy here is an obvious one, to use enamelled receivers instead of plain metal ones. The only difficulty that arises is how to get enamelled containers of the requisite dimensions, 2 to 3 feet broad. This might perhaps be overcome by using Aspinwall's white bath enamel on ordinary metal, but would need careful watching and experiment before being adopted into regular use. By the way, when is the friend of the "Digested Tea Notes" going to favour us with his next peptonized lucubrations?

The London Market.

In their issue of 20th ult., the *Produce Markets Review* remarks:—INDIAN TEAS.—The market continues active, and, in some cases, slight advances have been paid. The demand, generally, is improving, and an increasing trade has been transacted, especially in good medium and the lower descriptions, due in a great measure to the difficulty that may be experienced in getting tea of a similar character later on. The proportion of the autumnal growths is increasing, and, owing to the undesirable colour of the leaf of many of the parcels, the bidding has been active for teas of earlier import. There is a steady demand for the fine and finest kinds, as the quantity offering is sufficient to meet it, values are practically unchanged. These teas, owing to their improved qualities and strength, are comparatively cheap, and as imports draw to a close, it is just possible that the market will strengthen. Buyers, therefore, can hardly do wrong in keeping a fairly liberal stock. Of the 35,509 packages brought forward at the public sale upwards of 33,000 were sold. There was an active demand for the more desirable grades of the medium and lower leaf teas, while similar descriptions of Broken met with more inquiry at higher prices, and a steady trade was done in the better sorts at late rates.

CEYLON TEAS.—The sales on Tuesday last, although small, were somewhat larger than the previous week. Prices were well maintained, the demand being particularly brisk, and more attention was bestowed on the lowest grades of Leaf Tea, which have been comparatively neglected of late. The medium kinds continue in good request, and in many instances higher prices were paid, although this may be due, to a great extent, to an improvement in quality which was frequently noticeable. Broken Pekoes have been in good supply and are freely taken by the trade at the

sent low rates, this class of tea now showing exceptional e. At the public sales 19,300 packages were brought yard, of which about 900 were withdrawn.

uring vs. heavy
uning.

They are beginning to cry out in Ceylon against the evils of heavy pruning on the health and vigour of bushes so treated, and on the temporary poor qualities of the tea. The fact is that there is a great deal to be said on both sides, as on most other planting subjects. The primary object of pruning is of course to induce a free flush. When a tree gets bark-bound, and its wood all knotty and root-footed, there are three alternatives open. One is to be content with the inevitably poor results. The second is to cut down the old wood and let new wood take its place, harshly and lastly, to renew the bark and force new wood from the stem by manuring. The former we may dismiss as being beneath the notice of any go-ahead planter. Now as to the second, *i.e.*, heavy pruning of tea, especially on poor soil. The operation results, *imprimis*, in great shock to the plant and also a very considerable diminution of the plucking area. For the first year the yield is almost nil, and what there is, is sure to be poor all

round. In some cases the tree dies out altogether, and in others a branch or whole side dies back, all proving the severity of the shock to the system. But with rational manuring, *i.e.*, small yearly applications, there is at once observed a greater flow of sap, new branches force their way out from the stem, the knots somehow get "done in the eye" and the tree flushes merrily in spite of them. Putting the matter purely on the basis of immediate outlay and return, the bare cost of heavy pruning compares most favourably with that of even moderate manuring. But to this must be added the loss of $\frac{3}{4}$ of the year's yield, and a further loss on the remainder due to poor quality of tea. The cost of manuring is not slight, it is true, but against that must be set off a larger yield by at least 50%, though allowance has to be made for a possible fall in value of the tea. We shall not attempt to work out the result, but we have little doubt that the balance would prove immensely in favour of manuring *versus* heavy pruning. To sum up, we hold that to force a weakly tree on poor soil to yield healthy flushes by means of the knife alone is simply suicidal, it weakens at once both the tree and the soil. Manuring gives better results, strengthening the tree and improving the soil.

Planters' Library.

Please note that purchasers will effect a saving by sending a M. O. or stamps for the price of the books, and one anna on the rupee for packing. The value payable commission and registration fees will be saved, while postage being charged bearing (at the same rates as if prepaid) will ensure safe delivery.

" PLANTING OPINION," COONOR.

THE CHEMISTRY OF TEA.

An interesting but highly technical paper on "The Chemistry of Tea" was read by Mr. David Crole at the Society of Arts recently. Sir Stewart Bayley was in the chair, and in introducing the lecturer stated that besides being an expert chemist he had also been a tea planter in Assam.

We quote from the *H. & O. Mail*:—

Chemical constituents.

Mr. Crole began by describing the various chemical constituents within the tea-plant and their action there so far as that action was yet known. The chemical constituents of tea make a list of most portentous names—tannic, gallic, and boheic acids; benzene, phloroglucin, oxyhydro-quinone. Meat tea, said the lecturer, was a horrible meal, dear though it was to the hearts of certain English folk, because the tannin of tea then taken into the system in conjunction with albuminoid matter was converted into a leathery compound which took all the time of a powerful digestion to tackle. In fact, the meat tea meant dyspepsia. Besides theine the other alkaloids found in tea were theophyllin, theobromine, assamin, quercitrin, and some other undetermined ones, which the lecturer thought should be investigated.

Mr. Crole, after dealing at length with the chemistry of tea and its organic constituents, came to the question of the chemistry of the process of manufacture. He said:—

Withering.

Whilst the leaf is withering little chemical change takes place, beyond an incipient oxidation of some of the constituents of the sap. Withering is brought about by the evaporation of a certain variable amount of moisture, but generally about one-quarter of the original weight of the freshly-plucked leaf. This loss of moisture occasions a co-concentration of the sap; if this proceeds too far, however, (1) the cells will not burst in rolling; (2) some of the constituents of the sap will no longer remain in solution; and (3) the colour during fermentation will be uneven, owing to there being insufficient sap to spread over the whole surface of the rolled leaf.

If the fresh leaf is bruised the air gains access to the sap during the withering process, and the tea is, in consequence, inferior both in quality of liquor and also in appearance, owing to decomposition and premature oxidation having set in.

If the leaf is exposed to a temperature which is excessive under the circumstances—as, for instance, exposure to the direct rays of the sun—an untimely oxidation will set in which will spoil the leaf for manufacture.

Rolling.

The object of rolling is to give a twist or roll to the leaf, and also to break the cells of the leaf and thus liberate the juices they contain, so that they may be further acted on during the next process, and also that they may be more capable of extraction with water.

On the cells being broken the sap escapes, and during the continuance of the rolling is spread all over the surface of the rolled leaf, where it is in a very favourable position for the oxygen to act on it during the next stage of manufacture—*viz.*, fermentation. Some of this exuded sap is acted on by the hot air contained within the box of the rolling-machine, and in consequence a portion of the organic acids (chiefly the tannin) undergo partial oxidation. Some of the tannin combines with the oxygen to form phlobaphene (Bamber), and also glucose and gallic acid, assuming a dark insoluble form during the process, while part also combines with some of the albuminoid matter, an insoluble, leather-like substance resulting.

These two last reactions are only incipient at this stage, but are fully developed during the next process (fermentation).

Fermentation.

The next process, *viz.*, fermentation, is the most important one from our present point of view—*i.e.*, the chemical aspect of the subject. Strictly speaking it ought to be confined to a primary fermentation process (probably to an oxidising enzyme); for if fermentation is further encouraged (by allowing the rolled leaf to lie about heaped up for any length of time, for instance) the tea manufactured from such leaf will be spoiled. In my opinion, this species of secondary fermentation and decomposition always begins to set in after the primary fermentation is over. Oxidation pure and simple, has proceeded far towards completion, and it is to forestall the secondary fermentation, more especially, as well as to fix the primary fermentation, that the first stage of firing is mainly intended.

Mr. Bamber, who wrote on the chemistry of tea, asserts that there is no fermentation at all during the process which popularly bears that name in the industry, and he bases his theory on several experiments in which he failed to discover any micro-organisms; but recent research has shown that enzymes usually possess an oxidation action, and, again if the process is only an oxidation one, why is it of extreme importance to "fix" it by the first stage of firing at an exact moment when the climax is reached? For the firing would not fix oxidation, by any means, but would strongly tend towards hastening and increasing it. Therefore, I think that there is every reason to conclude that the technical term "fermentation" is correct.

My theory is that the process commonly known as fermentation in the tea industry is, during a greater part of the time, at any rate, mainly an oxidation one, but that later on (it takes a little time for the micro-organisms to develop and get to work), a fermentation to organism manifested by the peculiar rancid odour produced by over-fermentation of a butyric nature begins to be set up, which is desirable in the extreme to arrest at the very outset, since such action is deleterious to the quality of the tea.

Fermentation may be described as the splitting up of complex organic substances into simpler bodies, by means of either (1) living organisms, or (2) natural ferments or enzymes.

Living germs (micro-organisms) are responsible for such fermentative processes as are carried on by the yeast plant, or in sour rancid butter, or when nitrogenous matter acts on sugar to produce gum.

The natural ferments or enzymes are named diastase (in malt), emulsin (in almonds), invertin (in yeast), pepsin, ptyalin, and tryptase (the active principles respectively of gastric, salivary, and pancreatic juices).

The primary fermentation that I have described as being the one to be encouraged in tea, is due to one of the second class (*i.e.*, non-living ferment), whereas the secondary fermentation, which the one to be discouraged, and arrested by firing, can with a good deal of certainty be ascribed to a living germ or organised ferment.

For the oxidation process to be accomplished properly the following points should be observed:—

(1) The leaf should be sufficiently withered and rolled, and should be sieved to sort out the fine leaf from the coarse, as it is possible to obtain an even fermentation if the two kinds are not mixed with separately.

(2) A clean, smooth cement floor on which the leaf should be evenly spread, not too thickly, and the leaf should be kept moist.

(3) A dark, cool, airy room, with a moist draught of air if possible.

(4) The temperature of the leaf should be kept below 85 deg. As regards the temperature at which tea should be kept during the oxidation stage, I have given what I consider is a minimum temperature obtainable under ordinary circumstances in a tea-house in the plains; but I hold that a maximum of coolness during

ation, so as to protract it as long as possible (without, of course, missing the point when the secondary fermentation is in active progress), ought to be the aim in view, for reasons that will have been suggested when reading the remarks on the formation and decomposition of various substances during the processes of manufacture. In fact, it would be well worth while to ferment teas under such reduced temperature as can only be obtained in a tea factory by the artificial use of a refrigerator. I made this suggestion in my MS. of "Tea" a year ago, but I was misguided enough to circulate it. Since commencing to write this paper I was apprised of the fact that a machine had been brought out somewhat on these lines; but as it did not altogether carry out my ideas I determined, without delay, to bring out a machine myself embodying all the points that I had in mind, from a very extensive practical experience of and a large number of experiments with the fermentation of tea, were requisite. One of the most important chemical changes at this stage is an increased formation of essential oil, which it has been an aim in my machine to encourage.

The astringency of the tea is reduced by a further conversion of part of the tannin, to which this quality is mainly due, by a combination of some of the tanno-acids with some of the albuminoid matter, into a very sticky substance which imparts the characteristic tough feeling to the leaf at this stage. These two last reactions usually commence during the rolling process.

A small quantity of the tannin is changed into gallic acid and catechu, and it would be a great advantage if more of it underwent this change, since gallic acid is not nearly so injurious to the human system, when taken with albuminoid food, as tannin.

The pleasant aroma and nutty flavour of the leaf, so markedly developed during this process, are due to the formation of several volatile oils. If the process be too long continued, however, acids very similar to those present in rancid butter are formed, viz., butyric, caproic, &c. Prolonged firing will, of course, rid the tea of this disagreeable feature, but only at the expense of the greater part of the essential oil as well. This acidity, due to butyric fermentation, causes the coagulation of some of the albuminoid matter, which is usually present in the form of vegetable casein (legumin), which is an albumen resembling the casein of milk. This coagulation is unfortunate, as it converts a valuable food material (which tea is largely provided with) into an insoluble form, with the result that a large supply of nutriment is rendered useless. However, were it not already coagulated by the tannin, it would soon become so by the heat to which it would be subjected in the firing.

During the first stage of firing an increased amount of essential oil is freed by the bursting of the cells, and a further quantity is also formed by chemical action. Another action of this operation is to arrest the secondary fermentation—by which I mean that fermentation which, as I have already explained, begins to set in when the oxidation has about reached its critical point. It also removes about 40 to 50 per cent. of the moisture from the half-manufactured tea.

Special attention should be paid to avoid most of the volatile constituents being carried away and lost owing to the employment of high temperatures and draughts of too great a force.

The concluding operation that tea undergoes in the factories where it is manufactured is, of course, packing; and with regard to this, I may mention that it not infrequently happens that when a wooden chest is opened, on its arrival in the docks, the tea is found to possess a very nasty, cheesy smell, which takes some time to completely pass off. For some time the only explanation for this rather disagreeable feature that was forthcoming was that the tea, under certain extraordinary circumstances, acted on the lead lining enveloping it. But although experiments were tried to produce this state of things artificially, no action could be got to occur; and then a new theory was started, placing the whole blame of the mischief on to using green wood for the boxes, the exudation from which has a corrosive action on the lining between the wood and the tea. However, this has not been fully established yet as the cause of "cheesiness." I have little doubt, in my own mind, that both reactions conjointly produce this objectionable occurrence, and that some emanation of the green wood corrodes the lead, and then either itself, or its compound with the lead, acts on some constituent of the tea. Anyway, this is a point that naturally turns one's attention towards the several kinds of steel chests that are now being exploited.

(To be continued.)

THE OPINION AND THE FACTS.

FIRST let us have what the doctor said, then the facts upon which he based his opinion, and finally we may ask whether the facts justified that opinion.

The doctor's opinion was this, "*The man is suffering from chronic inflammation of the brain.*"

The facts as set forth subsequently by the patient himself under oath, and also verified by careful investigation, are these:—

In August, 1889, the first symptoms of disease appeared. He had a bad taste in the mouth, and a thick, slimy phlegm covered the tongue and teeth, so that he was often obliged to wipe it out with a handkerchief. He had no appetite, and after eating the simplest thing he felt great oppression, and pains at the sides and chest. Later on he was seized with dizziness and dreadful pain in the head, the back of the head being swollen, and so hot that it seemed on fire. This pain in the head grew worse, until the patient fancied his head must burst; and, as it was, he nearly went out of his mind with the agony of it. He got little or no sleep night or day, and as he could take practically no nourishment—that is, nothing at all equal to the needs of the body—he gradually fell away until there was scarcely anything left of him but skin and bone. After a time a hacking cough fixed upon him, and he constantly spat up much matter. At this point his malady had some of the indications of consumption.

For a considerable time Mr. Manning (the patient's name) was confined to his bed, and for nearly a year was unable to leave the house. As a rule he would rise from his bed about noon, and lie on the couch the most part of the day. To show his weakness we need merely say that he could only cross the room by taking hold of the furniture. The physician who attended him for one year said that Mr. Manning had *chronic inflammation of the brain*, and recommended the application of poultices and fomentations to the head.

"After having been under the doctor's treatment for a year," says Mr. Manning, "I was no better, and he said he could do nothing more for me. I then had another doctor, who said my case was hopeless, and nothing could be done for me. Our Rector's daughter got me several bottles of medicine for consumption from London, but it did me no good, and I lingered on in the same state year after year. I was in such pain that I often wished it might be God's will to take me. Several times it was reported that I was actually dying."

"In November, 1892, Mrs. Franklin, wife of the corn merchant, gave me a bottle of medicine which she hoped might do me good. It was called Seigel's Syrup. I had no faith in it, but I began taking it. In a week I felt a little better. My head was easier, I had some relish for food, and what I ate agreed with me. So I kept on with it, and gained a little every day. From that time I never looked behind me, and soon gained two stone in weight. I am now quite strong, and am back to my work. I can eat any kind of food, and am free from all pain. But for this medicine, Seigel's Syrup, I believe I should to-day be in my grave; and so great is my desire that others may know of the remedy that saved my life, I give full permission to the proprietors to publish my case if they think best to do so."

The above statement is condensed from the more extended legal one in order to save space. The other, however, will soon be published in full in another form. This is signed by Mr. Henry Delph Manning, of 3, High Street, Hilgay, near Downham, Norfolk, and has appended corroboratory statements from witnesses of high standing.

Now, we ask, was the doctor right in thinking the case to have been one of cerebral inflammation? No, clearly not, as *that* nearly always arises from a severe injury to the brain, and is usually fatal in a short time. The head trouble in this case was congestion of the brain, resulting from acute indigestion and dyspepsia, Mr. Manning's true and only disease. When Mother Seigel's Curative Syrup cured *that*, the brain and other disordered organs recovered health and tone.

MARKET SUPPLEMENT.

SATURDAY, MARCH 20, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (February 26, 1897) says:—Larger supplies were brought forward in Public Sale this week, and the market in most cases was rather easier. Nearly 3,000 bags East India have been offered and all sold at rather irregular prices, some favourite Home Trade marks realizing extreme rates.

Central American kinds have declined a further 2/- to 3/-, but here and there full value was obtained for colory parcels.

The term market was steadier during the first part of the week owing to a falling off in receipts and quotations advanced 6d. to 1/-, but at the close the market is unchanged to 6d. dearer since our last.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending February 17th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3 $\frac{3}{8}$ d. Brazil Exchange 8 $\frac{1}{2}$ d. Rupee paper 3 $\frac{1}{2}$ % 62 $\frac{1}{2}$. Silver 29 $\frac{1}{2}$ d per oz.

The moderate supply catalogued during the past week met with an irregular demand; the finer kinds of East India selling well, but the extreme prices paid the previous week are no longer obtainable, except for finest. Fine Plantation Ceylon, however, continues to be well competed for. Guatemala is about 1s to 2s cheaper. Brazil markets are dull.

Daily receipts have averaged 7,857 bags in Rio, and 9,714 bags in Santos.

The daily Brazilian receipts, contrary to expectations, show no signs of any material diminution, and in consequence the market for "Futures" has declined 2s 3d to 2s 9d, and closes with a weak tone, viz.:—Good average Santos in Havre, March delivery closes at fcs. 59.25, in Hamburg pf. 48 $\frac{1}{2}$, and No. 7 low ordinary Rio in New York \$9.00.

To-day's London official quotations are:—

	Feb.	March	May	Sept.	Dec.

645 " JAVA			

Statistics of Tea for the whole of the United Kingdom, from commencement of the season, as shown by the Custom House figures, are printed in the following table.

The small increase in Home Consumption is somewhat disappointing considering the heavy crops from both India and Ceylon, a condition which shows very forcibly the necessity of using every effort to promote the consumption of British Grown Tea in markets outside the United Kingdom.

ESTATE PRINTING

of any description, neatly and promptly executed, at moderate rates, by

ADDISON & CO., MADRAS.

ADDISON & CO.'s Printing and Binding Works are equipped with the latest patterns of steam machinery, to which considerable additions have recently been made.

ADDISON & CO., MADRAS.

land, &c. Tea land at high elevation, also coffee land, for sale, or partnership to open. Particulars to T. C., Editor of this Paper.

Small Capitalist. FOR SALE Rs. 6,000.—A newly-built brick Mangalore Tiled Bungalow, in about 50 acres of land, suitable for fruit growing or coffee cultivation under shade. Rain—80 inches. Only 3 miles from Taluk Headquarters, Govt. Dispensary Post and Telegraph Office. A good road leading to bungalow only 1 mile off Government Road. Apply sharp BUNGALOW, EDITOR, "Planting Opinion," Coonoor.

English Home and Education. A lady living at the seaside, in the healthiest part of County Cheshire, with her three daughters, who have had highest certificated education, are willing to receive and educate English children, of any boys or girls, any age up to 12 years. A thorough knowledge of English, French, German, Music, Drawing, being imparted to the pupils. Young and delicate children most conscientiously looked after. Terms and particulars on application to Z. Z., C/o Manager.

SOUTH COAST OF ENGLAND.

St. Leonards on Sea, Ancaster House.

English Education. The Rev. Frank R. Burrows, M.A., Trinity College, Oxford, receives Boys to prepare for Public Schools and Royal Navy. Ages 7 to 14. High and healthy situation, and comforts. Terms 50 to 70 guineas per annum. References kindly sent to, and particulars to be had from, C. A. Martin, Esq., LL.D., Surgeon, and Lt.-Col. G. C. Dobbs, I.S.C., Commissary-General, Bengal, Naini Tal.

Coffee Estate. FOR SALE.—A valuable Coffee Estate, in a good district, 100 acres in bearing, 25 young, 55 acres now being opened, 300 acres forest. Apply E. L., C/o Editor.

Eucalyptus Preparations. Eucalyptus Boiler Disincrustator at 12 annas per gallon in 40 gallon barrels. Eucalyptus Oil at 3/8 per 27 oz. bottle. Apply T. BROWN, "Glendale," Coonoor.

Tea Land. FOR SALE.—On easy terms, a block of 1,000 Acres of land in Wynaad, suitable for Tea. Apply "SOUTH," C/o Manager, this Paper.

Tea Land. FOR SALE. A BARGAIN.—A block of 210 acres of good Coffee Land in the Nilgiri District, planted with 20,000 4-year old coffee trees. No difficulty about cultivation. Grazing plentiful. Manure 1 a. per bushel delivered. Apply to "BARGAIN," C/o Editor, P. O.

Wooden Bungalow. FOR SALE.—A wooden bungalow containing a quantity of weather boarding, rafters, door frames, window frames, doors, windows, &c. Two Iron water-wheels. A quantity of powdered sulphur. A cash offer. Apply P. GUARD, Cherambadi P. O., Wynaad.

Rifle. FOR SALE.—450 Express, mail canvas case, re-loading and re-sizing Tools and some ammunition. In perfect order. u. c. Apply 303, MANAGER, Planting Opinion.

Good Land. FOR SALE.—Block of 1,000 acres, situated in the best district of Wynaad for the early showers; average annual rainfall 80 inches, with an average in January, February and March of over 5 inches.

Government Road from Coast to Mysore bisects the Property which is moreover bounded on the North and West by large rivers, each containing ample power throughout the year to drive Overshot Water Wheels.

The greater portion of the land faces North, North-East, and North-West, with a very easy lay, and the soil is admirably fitted for the growth of Arabica and Liberian Coffee, as well as of Tea. For further details apply to 303, C/o MANAGER, Planting Opinion. u. c.

Bangalore Orchard. FOR SALE £500 STERLING.—An orchard in good order within Civil and Military Station, Bangalore S. India, in a seven-acre block. Water available; containing a nice strongly built 8-roomed Cottage, with large outhouses and stabling for 3 horses. Estimated annual rental value £18. Fruit and other crop return £18 per annum. Further particulars, apply ORCHARD, C/o "Planting Opinion," Coonoor.

Ittithorai Coffee Estate. FOR SALE.—The Ittithorai Coffee Estate above Kullaar Railway Station on the Nilgiri Railway. Elevation 3,000 feet; 68 acres land, of which 20 in Coffee. Planted 1890. Looking fine for next Crop. Price Rupees 10,000, of which one half can be secured by a Mortgage on the property. Apply T. BROWN, Six Feby. Coonoor.

WANTED.

Liberian Seed. Wanted Liberian Coffee Seed, two or three bushels. Apply, stating the month in which it usually ripens, to H. PILKINGTON, Koppa, Kadur District.

Partner. WANTED.—A Partner to extend existing Tea and Coffee. Good District, many facilities. PARTNER, C/o MESSRS. BURNETT & SON, Calicut and Tellicherry. u/c.

Sambur and Bison horns. Wanted few pairs large horns. Particulars and price to "S. S. S.," C/o EDITOR, "Planting Opinion." Seven.

Cook. WANTED.—A Cook for Bachelors' Bungalow. Second Servant kept. Salary Rs. 12 or 13 according to qualifications. Apply Q., C/o P. O. u. c.

Bobbery Pack. WANTED dogs for a bobbery pack. Tongue essential. Apply A. H. SHARP, Devikulam. u/c.

Medical Practitioner. WANTED.—By the South Travancore Tea Company, Limited, a medical practitioner for the Kalthurthy Valley Hospital and Dispensary. Applicants must hold a diploma of, or equal to, a Madras Hospital Assistant. Apply to MANAGER, S. T. T. COMPANY, LIMITED, KALTHURTHY, Tinnevely District.

NILGIRI DISTRICT PLANTERS' FAMINE RELIEF FUND.

Famine Fund.

This fund has been opened as a branch of the fund started by the United Planters' Association of Southern India. Subscriptions (monthly) or donations are earnestly asked for from all residents in this district. Remittances should be sent to Hon. Secy., Nilgiri Planters' Association, Hon. Mr. H. Percival Hodgson, Kullakambay; Henry Wapshare, Esq., Guynd P. O.; L. W. Grey, Esq., Pykara; L. C. Liebenrood, Esq., Nellacotta.

E. G. WINDLE,
Hon. Sec., N. P. A.

Apl.

Nilgiri Tea Estate.

WANTED to lease for a term of years, or buy managing share, in a small tea estate on the Nilgiris.

Apply NILGIRI TEA,
C/o Manager.

u. c.

BILLET REGISTER.

ANY subscriber wishing to secure a billet, or desirous of a better one or in want of a manager, assistant, or writer, &c., is entitled to insert an advertisement to that effect free for as long a period as desired. These advertisements will appear on this page. Non-subscribers will be charged the small fee of one rupee.

To be worked in conjunction with the above, we have established a register, and names will be entered on application, together with copies of their testimonials. Thus should any enquiries be made for the services of a manager, assistant, &c., the names and testimonials will at once be forwarded, saving delay and trouble. Subscribers may have their names entered free; others will be charged a fee of one rupee.

BILLETS OFFERED TO.

Writer.

Wanted a Writer for Field work only, must have a thorough knowledge of coffee, keep a rough roll, and have a good labour connection. None need apply unless they have the latter. Apply A. MORGAN, Kil Kotagiri, Nilgiris. Eight.

Field Overseers.

Field Overseers from November 1896 in opening new clearing. Salary Rs. 20 to 25 per mensem. Natives only need apply.

Apply to A. H. SHARP, Esq.,
Devikulam.

BILLETS WANTED BY.

Young Assistant.

WANTED.—A situation as Assistant on a coffee estate by a young planter of steady habits, aged 20; has had one year's teaching under experienced planter in the Nilgiris; good references; small salary accepted.

Apply to H. E. C.,
C/o this Paper.

u. c.

Young Planter.

WANTED.—A billet by young planter, had one year's experience in tea planting. Will be willing to start on Rs. 50 per month.

Apply "P. I. E.,"
C/o Editor.

Seven u. c.

Assistant or Writer.

WANTED.—A situation as an Assistant or Writer on a coffee estate by a person possessing good testimonials and an experience of 15 years in coffee.

Address C. W. T.,
C/o this Paper.

Seven u. c.

Tea Estate.

WANTED immediately for cash, without incumbrance, a tea estate on the Nilgiris, with land for extension. Good bungalow and outbuildings necessary. Any reasonable offer will be considered and prompt arrangements made for conveyance.

H.,

C/o Manager, "Planting Opinion."

u. c.

No. 2123.

Cinchona Bark Tenders.

Cinchona Bark Tenders are hereby invited for the supply of Crown Bark, to be delivered at the Government Cinchona Factory, Naduvattam, before the 31st 1897. Particulars regarding form of tender, &c., can be obtained on application to the Director, Government Cinchona Plantations, Ootacamund.

OOTACAMUND,
25th March 1897.

WM. STANDEN,
Director.

Field Writer.

WANTED.—A Field Writer for a Tea Estate in a healthy district. Salary Rs. 30/- and C/o Manager, P. O.

u. c.

European gentleman.

WANTED—Employment by a European gentleman of experience, on a Coffee Estate. Willing to start on small salary. Has good knowledge of Tamil, Canarese and Hindustani.

Apply to "EPAMINONDAS,"
C/o this Paper.

Eleven.

Manager.

WANTED a situation of trust as manager European Gentleman with over 10 years' experience in Coffee or Tea. A temporary billet for say 6 months, Rs. 250 per mensem at first.

Apply F. O. B., C/o Manager.

By young European Planter.

WANTED employment as Manager or Superintendent of a Coffee Estate. Five years' practical experience in South Mysore. Excellent testimonials. Salary Rs. 150.

Apply E. P. L.,
C/o Editor.

Young Tea Planter.

WANTED position of Trust or Assistant Tea or Coffee Estate in S. India. Has had 10 years' experience in Assam. Is willing to work 6 months without a salary till he has learnt local conditions. Good references.

"A. K.,"
C/o Editor.

u. c.

Tea or Fruit.

WANTED an appointment as Manager or Assistant in tea or fruit. Ten years' practical experience, well up in the cultivation and manufacture of tea, and also the management of English fruit trees. Bachelor, age 29, active, working, sober habits, excellent testimonials and information from Manager of this paper. Can join at once.

KUMA.

Coffee Planter.

WANTED a situation in Coffee as Superintendent or Manager by a European with over 20 years' experience.

Apply I.,
C/o Manager.

u. c.

Superintendent.

WANTED a billet as Superintendent of a Coffee Estate by a planter of 14 years' experience. Testimonials and references given if required.

Apply PADD,
C/o this Paper.

u. c.

Tea Planter.

In 5 to 6 months time by a Managing Proprietor about to sell property, an appointment as Superintendent of a Tea Estate or a large tea house preferred. Mincing and Assam experience. Command of Labour.

Apply T.,
C/o this Paper.

RUBBER STAMPS,

BRASS SEALS FOR WAX SEALING

MONOGRAM, CREST OR ADDRESS DIES

ENGRAVING OF ANY DESCRIPTION

ADDISON & CO., MADRAS.

S. J. HEBERLET,

PHOTO-MECHANICAL PRINTER

IN
PHOTOGRAPHY, COLLOTYPE,
'PROCESS' BLOCK, PHOTO-LITHO.

Half-Tone Blocks suitable for Art
Commercial Printing; also for
Newspaper, Magazine or Commercial
work. Rs. 5 up to 2 in. by 3 in.; larger
sizes, twelve annas per square inch.

Zincos Blocks for surface print-
ing from line drawing, six annas per
square inch.

Collotype. The superior results
given by this process, together with
the advantages of printing with or
without margins, place this in the front
rank of superior work.

Prices on application.

Amateurs will find this process a
very cheap method of reproducing
prints from their negatives, a
thorough photo only being required.
Proofs accompany each order.

59 Bentinck Street,

CALCUTTA.

THE "MADRAS STANDARD,"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR ORGAN
IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished
Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore,
Cochin, and Pudukota contributed by Correspondents well versed
in the affairs of those States.

Letters from Far and Near } Political sketches and Caricatures of
and } the leading men in Southern India.
Telepathic Interviews.

Portrait Gallery—Lives of distinguished men in Southern India
with their Portraits. Spicy Jottings on current topics. Amusing
Notes, Stories and Sketches. News from various Mofussil Stations.
Interesting Extracts.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, APRIL 3, 1897.

[No. 7.

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, at Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a neater volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Thursday, the 10th April 1897.

Nilgiris. SHOLUR, 29th March.—No rain since last report. Lowest and highest temperatures between 6 A.M. and 6 P.M., 50° and 81° respectively. Tea picking freely. Labour plentiful but health indifferent, there being a lot of fever about. Price of grains normal.

PUNDALUR, 31st March.—Weather.—Very hot and unbearable during the day and very cool and cloudy at nights. On the 29th evening it was very cloudy with thunder and lightning, but passed off with a few drops of rain, making things worse. **Crops.**—Out in the open still lingering from want of rain. **Plant-diseases.**—Nil. **General Health.**—Fever among the coolies. **Labour.**—Have been paid up and left for country. **Interesting Items.**—The Glenrock Company has got at Athikunnu about 100 acres of tea, Assam, full grown, having Mr. Pannett at its head. I think it would be good for the Company to open about 100 acres as the seeds can be procured from the trees without cost, as the Company holds good lands suitable for Coffee, Tea and Cinchona cultivation.

N. Mysore.

YEDAHALLI, 29th March.—No signs of any blossom showers yet. If they don't come soon a good many of us will be up a very tall tree, as spike is very forward. The big bridge over the river at Thadasa, four miles from this place, is being rapidly built under the able superintendence of Assistant Engineer J. Bhore. It will be a boon when finished, as it is on the main road connecting the great Koppa District with railway; a portion of that road is now almost impassable for cart traffic. What it will be in the Monsoon, goodness knows. Days are very hot, but cool, strong sea-breeze blows up in the afternoon.

Coorg.

POLLIBETTA, 30th March.—Signs of rain since Saturday, the 27th. Thunder and lightning in one direction yesterday. It looked very much like rain yesterday, but it cleared up in the evening. Previous to the 27th the weather was very fine and hot with high east wind and copious dew at nights at times. **Crops.**—The last set has been good, but rain is wanted to help the berries to swell. There is a good show of spike, and if the next showers are sufficient, there ought to be another good show of blossom. **Plant-disease.**—Borer is showing up to a somewhat larger extent than before, but it does not look as if it will be severe this season. **Labour.**—Sufficient. **General Health.**—Fair. **Interesting Items.**—Camp of exercise on at Mercara.

Lower Pulney.

AHTOOR, 30th March.—**Weather.**—Last fall of rain 19th February, which turned a good deal of spike to flush. No rain since, and a fair show of spike shows up now. Weather has been threatening the last few evenings, but no rain has fallen. We can last another fortnight without rain, but shall begin to need it then. **Crops.**—All despatched. Outturns generally rather disappointing; a little gleanings still being carried on. Local prices very low this year for a lack of Tail Coffee. **Plant-diseases.**—A very little green bug to be seen in places, but much less than this time last year. Leaf-disease all disappeared. **General Health.**—Fair, a little fever beginning. **Labour.**—Local labour returning after paddy harvest. Supply good. **Interesting Items.**—A planters' meeting was held at the Dindigul Club on the 22nd, followed by a few days' gaiety. Regret to record the death at Dindigul of our pioneer

planter, Monsieur E. deFondclair, of fever on the 25th instant, aged 65.

Mysore.

MUDIGIRI, 29th March.—Weather.—

Fine; ordinary hot weather conditions prevail. Night of 28th cloudy with lightning and distant thunder to the south-east. Hazy during daytime. No rain since 16th. *Crops*.—The spike is "burning" in open places; rain is badly wanted to swell the berries from the blossom that opened in February. Prices of grain fallen recently. *Plant-diseases*.—Nil. *General Health*.—Fair. Fever and bowel-complaints prevalent. *Labour*.—Ample for all requirements. *Interesting Items*.—A fine tiger was shot on the night of the 24th at the Kummercode village, on the borders of the Kummercode Estate, and some 50 yards from the Putail's house by means of spring guns set by the Putail over the carcass of a buffalo it had killed the previous evening. The measurements, taken before the animal was skinned are as follows: From top of tail to nose, 9 ft. 4 inches; height at shoulder, 3 ft. 7 inches. Death must have been instantaneous as two bullets entered its neck, one passing out above the shoulder. The animal was in perfect condition. From information gathered, the reward offered by the Mysore Government is from Rs. 15 to Rs. 40; the skin is then the property of Government and is sold by public auction.

GENERAL NOTES AND ARTICLES.

LIGHT RAILWAYS FOR PLANTING DISTRICTS.

THAT planting districts are in urgent need of better communication with the outside world is a truism only too patent to all concerned. Roads are good enough in their way, but even the best of them afford but indifferent and extremely costly facilities for carriage of supplies and produce. Where roads are already in existence, a cry is raised for railways.

The response to such appeals has not been encouraging. The mistake lay in the style of railway asked for. There are railways and railways, and in lightly populated districts with a meagre traffic, the construction of *pucca* broad or even metre gauge lines is a most serious matter. There are now four gauges in India,—the standard, the 5 ft. 6 in.; the metre, 3 ft. 3½ in.; and two special gauges, the 2 ft. 6 in. and 2 ft. The original gauge selected for India was the 5 ft. 6 in., but the enormous costliness of this gauge was speedily proved to be an insuperable bar to the extensions so urgently required. It was then that the metre gauge was introduced, with incontestable results in the way of dividend earning. Of the special gauges, one of the best known is that of the Barsi Light Railway, 2 ft. 6 in., which has irrefutably been proved to possess the greatest carrying capacity per cent. of cost of track of the three. It has sufficient stability to carry goods of very great weight and bulk, while the flexibility of its alignment is such that it can accommodate itself to countries of the most mountainous character, at a fraction of the cost of a standard gauge line negotiating similar difficulties.

The cost per mile of such light railways is, even under the usual circumstances, under £200 per mile; while if

full advantage were taken of the existing roads, and stations, level crossings, etc., avoided, as well they might, probably the initial outlay would not be much over that amount.

It is not difficult to understand what a huge difference this must make, if properly represented, to the prospect of opening up our planting districts by means of cheap transport. As already remarked, our estimated traffic is in cases barely sufficient to pay the minimum interest required in the initial cost of production of *pucca* standard or metre gauges. But it is, without perhaps a single exception, more than ample to provide a very respectable dividend on light railways as we are advocating.

The matter is one that deserves the closest attention of Indian planters, whether in South or Upper India. It is one that has been far too much neglected; we trust it will no longer remain so.

Science and planting.

Practically all planters are in favour of obtaining scientific assistance for their industry, but few are inclined to pay for it. This can be now seen in Upper India, a lot of big talent has been indulged in regarding the engagement of a scientific officer for the tea industry. Yet by the last committee minutes to hand of the Indian Tea Association, we find with no surprise but with great regret, that the scheme has been practically shelved. The argument seems to be that there is no sufficient outlet has been found for the produce, and that it costs money; there is no earthly use to spend more in planting planters how to increase their crops,—which is a plausible but not convincing argument.

"Creepers" in Ceylon.

It is almost impossible to take a Ceylon journal without finding mention of the arrival of one or more "creepers" chronicled, the import being so brisk that three or even more per steamer is nothing unusual. What becomes of them all is hard to tell, and we fear will be an impossibility to ascertain until the statistics are kept more accurately than at present. We only hear of the import, but assuredly the export in the form of "returned empties" must be of imposing dimensions. Accurate returns of the creeper export would, we venture to say, be of great interest to many parents and guardians who at present believe that a "creepership" in Ceylon or India for the matter of that, is an easy road to fortune.

Registration of the U. P. A.

In our last issue a correspondent desired to know whether the U. P. A. was a registered Association or not. We are pointing out the obvious necessity of such registration. We are glad to inform him that the matter was already under consideration of the Committee before his letter appeared. There can be no doubt that registration is desirable not merely for the protection of the Reserve Fund and the Trustees, but in order to facilitate action in respect to matters as the employment of Counsel to watch planter interests in actions at law. For instance, the reference under Act XIII. of 1859 that are now pending. We understand that the subject of registration is to be bro-

the next Annual Meeting, and that, prior to this, a definite scheme is to be formulated, including amendments of rules that would be rendered necessary.

Cinnamon. The demand for cinnamon is fully equal to the supply, and the tending prices is in an upward direction, says the *H. and C. Mail*. The quarterly sales last week there was a brisk competition, and nearly the whole of 1,250 bales and 43 parcels realised full rates current by private contract to an advance of $\frac{1}{2}$ d. per lb., especially for the commoner qualities. There was no material rise as compared with the prices published in November last. The general range of quotations was as follows: First quality cinnamon, low, at $7\frac{1}{2}$ d.; ordinary to good at $10\frac{1}{2}$ d. to 1s. 1d.; fine and superior garden growth at 1s. 3d. to 1s. 6d.; seconds, very inferior, at 7d. to 9d.; common to finest at 10d. to 1s. 2d.; fine plantation at 1s. 4d. to 1s. 5d.; thirds, coarse, at 8d.; middling to fine, $9\frac{1}{2}$ d. to 1s. 1d.; best mark at 1s. 3d.; fourths and fifths from $6\frac{1}{2}$ d. up to 1s.; extra fine, 1d., and a few broken (in boxes) at 9d. to 10d. per lb.

Antic robbery. £44,000,000 is the estimate, according to a question in the House of Commons, of the amount which the Indian people have been robbed by the Government in closing the mints. As planters, we should hope most officials know, silver ornaments and jewellery represent the savings of the people which were formerly always convertible into rupees when required. To appropriate £44,000,000 is a feat which is enough to drive mad with jealousy the most accomplished bank robbers the world has ever seen. What would happen in England if the Government were to decree that 25% of everybody's savings should be forfeited, may be better imagined than described. The Indian Government might easily find the five or six millions sterling for the famine, that would only be paying back about 2 annas in the pocket of the "swag" collared from the unfortunate inhabitants of India. The only benefit the Government has given in return for this gigantic robbery is the very obvious one of a bogus currency. That India is a poor country we are always being told, but that there is another country on the face of the globe that would tolerate such wholesale robbery by its officials for their own benefit we cannot even dream.

Ville. We regret to have to record the death of the famous agriculturalist, Georges Ville. He will long be remembered as one of the pioneers of scientific agriculture. His works on agriculture have attained a wide popularity and are unsurpassed for correctness of style. He also attained wide repute as an interesting and effective lecturer, and probably did more than anybody else to popularise scientific agriculture in European countries. He will probably be remembered as the first to maintain that plants derive a considerable part of their nitrogen from the atmosphere. This theory he strenuously upheld in the face of almost unanimous opposition from other agricultural chemists. He did not limit his theory to leguminosæ, however, nor did he indicate the means whereby the fixation of nitrogen is carried on. Subsequent discoveries have proved that he was correct as regards leguminosæ, and it is not impossible that future

science may discover that other natural orders have similar powers. He strongly advocated the ploughing in of green crops, which he recommended as a practically costless system of enriching the soil. That he should have been mistaken sometimes is only natural; but there is no doubt that the whole agricultural world is deeply indebted to him for his eminent services in the advancement of agricultural science.

Ceylon planters abroad. In a recent issue of a journal published at Colombo, calling itself the *Times of Ceylon*, we are again taken to task for commenting on the appointment of a Ceylon planter to manage a large Brazilian property. The excessive irascibility of our contemporary may probably be explained by the truth of our remarks on the principle of the greater the truth, the greater the libel. The absurd arrogance of the Ceylon paper may be well illustrated when it denies our right to comment on planting matters outside S. India, reserving that right apparently for itself. We suppose the *Times of Ceylon* means to be taken seriously instead of comically, but its contention is so utterly ludicrous that we decline to waste time in discussing it. The amusing exhibition of temper may probably explain the garbled account of what our correspondent wrote, and excuse his very clear remarks being twisted and tortured to bear a meaning entirely contrary to their legitimate interpretation. Our original remark that has so aroused the Colombo journal's ire was that we considered it strange that a Ceylon planter should have been selected to take charge of a Brazilian property, as in no country in the world has coffee been so utterly wiped out as in Ceylon. Let us hope that Brazil may have a more fortunate experience of the introduction of the Ceylon system than India has. There is not a single district in South India that cannot show its desolate memorials in the form of abandoned estates, the devastating handiwork of the Ceylon planter. We are glad to see from our contemporary that Ceylon coffee planters are in demand for planting coffee in many countries, if only from the assurance that the world's crops will not be thereby increased. But perhaps we may be excused expressing our surprise that the supply can keep up with the demand, when the combined efforts of all the Ceylon planters have only succeeded in producing an export of some 20,000 cwts. last year. Our original remarks we consider fully justified, and we can pardon our contemporary's childish exhibition of temper on the same grounds that the Chief Justice of Ceylon did in a late contempt of court case, the Editor of the Colombo journal being pardoned "as he didn't know better."

Artificial manures. Every year the already huge artificial manure bill of South Indian planters grows larger, and as better means of application get discovered, the increase is likely to be faster than ever. It is a sad but patent fact that the demand for such manures has far outstripped the intelligent appreciation of the system. The consequence of such ignorance involves an enormous waste of money in purchasing inferior stuff, when a really first-class article is readily obtainable at very much the same price per ton and infinitely cheaper in point of manurial value. This loss would be easily and greatly reduced if the community, as a whole, had acquired

any familiarity with the rudimentary principles of agricultural chemistry. Yet there is a section of representative and influential planters in every district who have moved with the times. And it is to these to whom we would appeal. It would not be overloading the agenda paper of the next U. P. A. meeting were a proposal brought forward that the provisions of the laws in England for the regulation of the sale of artificial fertilizers be brought into force in India. As we have remarked, the present methods of the trade are highly unsatisfactory. The sole value of such concentrated manures as poonacs and fish, lie in their nitrogenous and mineral constituents. Consequently the more pounds per ton contained of these constituents, the more valuable the manure. But fish to most planters is only fish, and poonac but poonac, and how one brand can be better than another passes their comprehension. If they must get it, they must, but there ceases their interest. To call such an attitude fatuous is to err on the side of politeness. The only possible excuse for their policy of indifference is their contention that the firms who sell the manure furnish analyses of their wares only if specially so required, and that these analyses may be true enough of the quality of the sample analysed, but by no means necessarily so of the particular consignment despatched. It is only natural that this last should be the case. If their customers are generally so indifferent as to the quality of the goods they purchase, what can it profit the suppliers to take any special care?

It may seem as if our arguments were mutually destructive, yet the effect of the measure we advocate would be beneficial to all parties. Were the manure firms obliged by law to guarantee the quality of the goods they offer for sale, business therein would be greatly stimulated, for the present minority of men "in the know" would certainly purchase a great deal more freely than at present, while the great majority of those so lamentably ignorant of the manures which the exigencies of modern planting compel them to use would be forced to spend a little more time in investigating the question. And with only one result.

KOLA NUTS AND THEIR CULTIVATION.

[By FRED. B. KILMER, CHEMIST, NEW BRUNSWICK, U. S. A.*]

THE following notes will be found of interest and should induce enterprising planters to give the kola plant a trial at least. The yield is stated to be 10,000 lbs. per acre. The market price of the nut is about 8d. per lb. Dividing the crop by ten and reducing the price by 25%, the gross yield is, at the present exchange, about Rs. 400 per acre. There is no machinery required whatever, neither curing nor pulping being necessary. It grows into a forest tree, needs no pruning and serves as a good shade for coffee. It begins bearing in about five years:—

Supply of the nut. The kola nuts, as found in the American market, come mainly from Africa. The bulk of the West India nuts are consumed by the inhabitants of the islands where grown; a very small part of the crop is shipped to Europe. Lately, small supplies have reached our market from this source. No accurate estimate of the extent of the world's supply, nor the possible yield for this drug, can be given. The official reports of the African trade give from 2,500,000 to 3,000,000 pounds per year, which is largely utilized for home consumption. Those

who are familiar with tropical products can realize the difficulties and peculiarities of the market in such a commodity. It is carried on mainly through native women. There is a certain amount gathered for home demand. The quantity that will reach the shipping ports must depend upon the caprice of the natives, and especially as to how much they stand in need of rum or tobacco. The nuts must all be carried, often hundreds of miles, in head-loads, through miasmatic forests, over impassable streams, across pathless mountains, under a tropical sun. The conditions are such that, to carry a ton of nuts and safely land them on a ship that plies along the sunny shores, is a task that one would shrink from after a survey of the field. The native gatherers are shrewd dealers, even if not skilled in the arts of civilized commerce. They know how to create supplies, to create a rise in price; and they also know that, where the European buyer wants the nuts badly, grades that have no value at home will find a ready market. This accounts, in part, for the variable nature of market specimens. In the West Indies the Government encourage the cultivation of the plant, and, for many years, ample supplies from this source will be obtainable. In our own country some attention and discussion has taken place looking towards its cultivation on our soil.

Soil and climate.

The kola plant seems to grow well in a climate where there is plenty of rainfall and a warm, tropical sun. Of course, the hotter and more moist the climate, the better. Wherever bananas, nutmegs or cocoa will grow it is safe to say this tree will thrive. The best kind of soil is a heavy loam which is deep, rich and clayey, although it will grow in a variety of soils. In some of the West India Islands it may be found as high as 5,000 feet above the sea-level, but the best specimens are generally found about 1,000 to 2,000 feet elevation. If the situation is low and damp, the ground must be well drained.

Nurseries.

The young plants may be obtained directly from the seed planted in the field where they are to grow; but the best results seem to come from planting seeds in nursery beds, transplanting them when plants are 1 to 2 to 3 feet in height. The seeds, as usually obtained from grocers, are packed for shipment in boxes covered with earth, and the boxes are wet with fresh water. Holes are bored in the boxes for ventilation. The nursery beds in which they are planted are made of loam, free from leaf mould and kept shaded. In nursery planting the seeds are put in the bamboo pots commonly used in the tropics, and planted from 9 to 12 inches apart. It takes three to five weeks before the sprouts appear above the ground.

Planting.

When ready for transplanting, they are planted at a distance of about 25 feet apart. If the soil into which they are transplanted is not rich, the best planter digs holes several feet deep—5 feet each way around—and fill in with topsoil. It is necessary for the young plant to have shade. Most intelligent planters, who have lately taken up the planting of kola, use the banana for the purpose. The banana is very rapid-growing. It shelters the young kola plant and makes a profitable crop while the kola is coming into bearing; kola, in turn, will begin to yield the time the banana has exhausted the soil. The bananas are planted 10, 11 or 12 feet apart, with the kola at every second banana in the direction of the line. Thus, a plot of 20 feet square is enclosed with banana trees with four kola plants at the corners, leaving the kola from 20 to 34 feet apart. In sheltered situations, as in a valley between hills that have a growth of woods, the bananas are omitted in the centre of the square, to give more light and air. A gradual thinning out of the banana is made as the kola acquires increased growth. Kola is usually planted at the beginning of the wet season.

Crops and cultivation.

Grown wild, it commences to yield fruit about the fifth or sixth year. Well-cultivated specimens often begin to bear considerably earlier. In the wild state they reach full bearing in the ninth or tenth year. When the kola tree attains full size, it is customarily planted with planters to place in the field with them small varieties of coffee or some vegetable plants such as peas or yams. Kola gives a good fertilizer. By this method a kola plantation costs nothing except for the first planting. Kola does not appear to exhaust the soil as does the coffee, banana, orange, etc. Upon once attaining growth it appears to be of permanent value. Specimens that have borne for fifty years and probably longer have been noted. Independent of its value for the nuts, kola is an excellent shade timber tree, and is utilized for this purpose. A conservative estimate

*Abstract by the author of a lecture delivered at the Pharmaceutical Meeting of the Philadelphia College of Pharmacy, January, 1896.

yield is 120 pounds of dried nuts, or over 250 pounds of green per tree, or from 8,000 to 10,000 pounds per acre. No such nuts, however, are gathered in any portion of the West India islands owing to the unsystematic and haphazard measures employed in harvesting the crop.

Taking up that part of the plant probably of the greatest interest, the seed or nut, we examine the pods, which we will find contain from two to three nuts, or seeds, so closely pressed together in growing as to be crowded into various shapes. The cellular tissue of the pod in drying is filled with a very slimy, stringy mucilage that is easily observed upon ripening. A singular fact noticed about the pods is the fact that red and white nuts are found side by side in the same pod. So far as my observation goes, pods may be found to contain all red or all white, but no trees give all white or all red seeds. The native users lay great stress upon the difference between the white and the red kola nuts. Symbolically, the white nuts mean peace, happiness, veneration, acquiescence to overtures. Red nuts mean the reverse: war, ill-will, challenge, rejection of overtures, etc. In some instances the white seeds command the higher price, being in repute as giving greater and better effects. The dried nuts found in our market it is difficult to distinguish between the white and red varieties. Oxidation during the drying of the seeds gives to both about the same yellow-brown colour. When subjected to the action of solvents, white or red nuts (dried) when put into water, alcohol, acetone or glacial acetic acid, shades of orange or yellow which are so nearly alike that considerable practice is necessary to distinguish between them. The colouring matter of red nuts is, however, very soluble in dilute mineral acids. The white and red varieties may be distinguished by macerating for twenty-four hours in dilute sulphuric or hydrochloric acid when it can be found that the acid extraction of the red kola is a beautiful rose, while that of the white seeds is of a light straw colour. Vogel has shown that if the acid extraction is made alkaline with soda, that from red nuts assumes a purplish violet; that from white an ochre-like colour.

Several observers have noted that the red nuts give a larger percentage of mixture; Heckel gives 46 per cent. for white, 56 per cent. for red. The same author claims that the white seeds contain 5 per cent. more caffeine, 7 per cent. more of the peculiar principle, kolanin, than the red. My own experiments tend to confirm the observation that there is an appreciable difference in the amount of glucoside found in the white seed as against that found in the red.—*Jamaica Bulletin*.

CARDAMOMS IN COORG.

The following article originally appeared in the *Indian* some months ago, pressure on our space forbidding its earlier appearance. It is, however, so full of interest that we have no hesitation in publishing it:—

The Cardamom cultivated in Coorg is the *Elettaria Cardamomum*, although the trade, so far as native-cured fruit is concerned, is usually falling, still the cardamom is an important article to the people and is certainly the cause of much thought and anxiety to the Administrators of this little Province.

We will not give any botanical description of the cardamom in this article, nor will I refer to the other kinds which are not utilised, but endeavour to give an idea of the habitat of the plant and the methods of curing it followed by the people, with a few remarks on the state of the cardamom trade.

The cardamom grows best on the Western and Northern slopes of the ghats at an elevation of from 3,000 to 5,000 feet above the sea. At the full burst of the monsoon strikes the steep sides of the hills and the rainfall reaches as much as 300 inches in some parts. It grows spontaneously, but is one of those peculiar plants the seed of which lies dormant till induced to germinate by the occurrence of favourable conditions. One of these is the admission of light. Cardamoms will only be found in the dense evergreen forest, and the ordinary method of inducing them to appear is to open a small space in the forest by felling one or two very large trees. Not only does this admit the light, but the fall of the trees shakes the ground and breaks the surface. So thoroughly is the necessity for the shaking of the ground believed in, that when a plot is selected, all undergrowth, small trees, &c., which might interfere with or break the fall

of the giant selected for destruction, are cleared away so that the tree may descend with all its weight and momentum: and to intensify the effect the tree is always felled so as to face downhill. As these plots are almost invariably situated on the steepest hills, the effect of the fall of one of the enormous trees so common in the Ghat Forests must be very grand.

A Cardamom Estate is called a "male," and the ordinary method of cultivating a "male" among the Coorgs is to open out a certain number of these plots within the limits of the same. The plots are necessarily small, for only a limited amount of light is required, and a plot too large, in addition to admitting too much light, would also allow of evaporation from the soil to an injurious extent. In the leases given for "males," the maximum size of each plot is fixed at one-sixth of an acre, and at least thirty feet of forest must be left between any two plots. As a rule not more than two trees are felled and oftener only one. The felling generally takes place in February or March in the year and by the rains the young plants shoot up. They require weeding at least once before they begin to yield, which takes place in the third year. The plant continues to bear for seven or eight years, the fourth and fifth and sixth of its age being its best. When it begins to cease bearing, either a new plot is selected or another tree is felled which seems to give a fresh start to the plant.

The position of these "males" is generally so remote and inaccessible that the picking of the crop is undoubtedly no easy task. In fact, the Coorgs lose a large proportion of the crop, for the fruit begins to ripen as early as July, while they never attempt to pick before well into September. The tremendous rainfall not only in itself deters them from penetrating the hills, but renders the numerous streams and torrents impassable. Indeed, on the exposed slopes of the Ghats, life would scarcely be livable in the height of the monsoon. As it is, the leeches in these forests throughout the autumn and cold weather months must be seen to be appreciated, and in addition to these drawbacks, the steepness of the hills is such that walking is difficult. When climbing about these "males," one can quite comprehend the feelings of a fly walking on the side of a house.

The cardamoms are picked and sun-dried. If the male is far from the village, the drying takes place on the spot, otherwise the capsules are taken home. Four days sunning is sufficient, care being taken that they do not get wet and that they are not over-exposed, as this latter would cause the capsules to burst. But beyond this open-air drying, no further curing takes place. The fruit stalks are rubbed or picked off. In this part of the process, it is wonderful the number of capsules a practised hand will clean in any given time. The capsules are then assorted according to size and colour and stored away till disposed of. But a better system of both cultivation and curing has been introduced into Coorg by an English planter in the ghats. I am much indebted to Mr. Finlayson for his having put at my disposal the necessary information concerning his treatment of cardamoms. In the first place the cardamom plant is raised from seed in a nursery and the plants are put out in a compact plantation instead of being allowed to grow spontaneously in scattered clearings. The first step is to prepare the area which is to be made into a cardamom plantation. This is done by thinning the shade. The amount of thinning can only be determined on the spot and is guided by experience. The aspect chosen is generally north or north-west, and the most favourable places are the moist hollows and ravines. The undergrowth is cleared, and planting is done in June and July, from nursery plants raised from seed, supplemented by bulbs from old stools. Mr. Finlayson prefers the latter as growing better. The plants are put out at 7 feet by 7 feet, not deep in the soil. The plants are put into shallow pits which have been filled with surface mould; the soil is pressed round the half exposed bulb and the plant tied to a stake.

These cardamoms yield a small crop the third year after being put out and they do not come into full bearing until the fifth year, thus there is no advantage in time in this method of cultivation. The yield then is about half a seer to each plant. Thus an acre would give about 475 seers, or say 950 pounds, under half a ton. The picking lasts from July to January, September and December being the busiest months. The first crop always yields the largest fruit.

Before proceeding to give Mr. Finlayson's method of curing, I will venture on a comparison of the advantages resulting from the two systems of cultivation, the native one by means of isolated and scattered openings in the forest, and the English one of a regular

plantation. As to the former, the only advantage that can be claimed—and I am not certain that the claim should be allowed—is that it does less harm to the forest which, as the Ghat Forests should be preserved for climatic reasons, is a very important point. Mr. Dickinson, whose knowledge of the conditions of cardamom cultivation owing to his personal inspection of the males and ghat forests is unique, is in favour of the native method on the ground of less damage being done to the forest. He argues that the partial clearing of the high forest over a comparatively large area, accompanied by the removal of the undergrowth, tends to set up scouring and that the soil will be all washed away. But the drawback to the native system is the difficulty of supervising the work and of enforcing the rules as to the size of the plots and the width of the belt of forest to be left between each plot, and though it is in the interest of the male holder not to open the forest to too great an extent, it is a question whether, with the low prices ruling in the cardamom market, the urgent necessity of raising a large crop will not, and does not, tempt male holders into over-felling, leaving the future to look after itself. Where a forest has been over-felled under the native system, the damage is practically irreparable. It is with very great diffidence that I differ from one so well up in the subject as Mr. Dickinson, but I have seen both systems of cultivation, and taking all the conditions obtaining, I am decidedly in favour of the English method of cultivation, as it is more easily and effectually supervised; it concentrates the damage done into a smaller area, the crop is more easily and more cheaply picked, and the whole working of the estate more in accordance with science.

Mr. Finlayson dries the capsules partly by exposure to the sun and partly by artificial heat. The former is the better method, but owing to the uncertainty of the weather, the latter, in the end, pays better. The cardamoms are bleached by exposing them to the dew for a couple of nights and then fumigating them with sulphur. Mr. Finlayson is naturally somewhat reticent as to the process his cardamoms pass through, for the supply is large and the market restricted and the competition from Ceylon, Travancore and Mysore is keen. Before picking, the capsules are carefully sorted and clipped. I am unable to give the cost of cultivating, picking and curing the cardamom under this system. It is finally packed in boxes and sent to the market.

The price of cardamoms has been steadily diminishing of late years, Rs. 14 to perhaps 'in a few instances' Rs. 18 per maund of 28 lbs. is the average selling price of native-cured cardamoms. The English cured sell from Rs. 1-8-0 to Rs. 2-4-0 per lb. The system in force in the days of the Coorg Rajas as regards the disposal of cardamoms was that the whole crop was handed in to the Government, who paid the cultivators a fixed price per maund and sold the crop for itself. The price paid was from Rs. 12 to Rs. 20 per maund. This was continued after the annexation of Coorg until 1846, when the males were put up to auction and they are now leased, tenders being invited for a certain period of years. There is another class of male in Coorg—the Jama male—the holders of which have a right to the produce on payment of rent, which is assessed on the estimated yield.

The prospects of the native cardamom cultivators are extremely gloomy. Owing to several causes, the cultivators have been having a bad time of it lately. Falling prices, the enfranchisement of their slaves which necessitates payment of labour, and bad seasons, have all combined to render it impossible for many of the lessees to pay the rent they covenanted to six years ago. So bad has been their condition that the Local Government has had to allow a large number to resign and the condition attached to the acceptance of the resignation, viz., the payment of all arrears, has been found difficult to enforce.

It is a matter of extreme regret that a comparatively large number of families should lose their principal means of livelihood, but it is useless for the State to endeavour to oppose the laws of economics. Want of capital prevents these small male holders from cultivating and curing their cardamoms in a paying way. The outturn is so poor in quality that it necessarily fetches a very low price when the beautifully cured capsule of the English grower is competing with it, and the problem will soon work itself out with this result, that the producers of native-cured cardamoms will become fewer and fewer, until the produce they put on the market only suffices for the demand. For, strange to say, despite its inferior value and condition, there is still a demand for this kind, and always will be, as long as there are people who, though desirous of purchasing, can only afford to pay low prices and must, therefore,

perforce put up with an inferior article. The slow extinction of the male holder is a serious loss to the Forest Revenue, but, I fear, go he must, and the Department must look around for some fresh source of revenue to make up the deficit.

G. H. FOSTER.

THE MANUFACTURE OF SALTPETRE.

LEXICOGRAPHERS define saltpetre as nitrate of potash (*potassa*), and potash as ashes from burnt vegetables; here, therefore, the ordinary reader has to stop and rest satisfied with the scanty information conveyed by his dictionary. It follows, therefore, that very little is known about saltpetre and its manufacture, except that, combined with charcoal and sulphur, it forms gunpowder, one of the necessities with all nations. It must, therefore, be an important article of commerce, and a description of its manufacture should prove of more than ordinary interest. It is simplicity itself, but the modes at present generally adopted are primitive to a degree; when such manufacture is more general, improved methods are sure to follow. In the North-West Provinces this manufacture is in the hands of a coterie of natives, and is conducted in outlying villages in an unsystematic manner, yet it pays handsomely.

To describe the manufacture of saltpetre as it is at present conducted: The first requirement is the soil in which the "fungus" containing saltpetre grows, and it simply abounds. An old village—the older the better—is selected, and by payment of a small annual revenue to the zemindar, a contractor may purchase the right of collecting saltpetre-surcharged soil. Old walls, huts, sheds, etc., give an abundant supply of this soil. Wherever damp has left its traces, there the "fungus" incubates and grows apace; wherever animal excreta are deposited it takes root, and in sandy lands, after the annual monsoons, it flourishes. It requires no skill to discover this soil, as it betrays itself both in appearance, which is that of a shining surface, and to the taste, being saline. All that is necessary is to scrape the surface of the soil, fill it into bags and convey it to a factory. It is here converted into saltpetre. To describe the process: This earth on receipt into a factory is submitted to a fire test to discover the amount of foreign matter it contains, such as pure earth and salt. This is important merely as a detail, for the earth is invariably purchased from contractors at prices varying to about annas six a maund (80lbs.) The work of manufacture commences with the filters, which are merely pits dug in the open, measuring about 6ft. long by 4ft. wide by 2ft. deep; the bed of the filter slopes towards a vat, and is covered with loose lime, ashes, clinkers or rubble, to aid filtration. These filters are filled with the earth and water plentifully poured over it: in about twelve hours the vat becomes filled with a ruby-coloured liquor, which contains the best part of the saltpetre and salt from the earth, but not all. This liquor is next conveyed into boilers and allowed to boil for a matter of twelve hours, during which time the greater portion of the salt contained in the liquor precipitates, and is carefully ladled out. This salt, no matter how small the quantity may be, is excisable, and consequently a saltpetre factory comes under the espionage of the Salt Department, the duty of Rs. 2-8 per maund being forced on to the saltpetre manufacturer, or the quantity of his output in salt is held. One of the larger factories recently had as large a quantity as five hundred maunds of salt stored in their godowns and could not dispose of it at even the ridiculous figure of one anna per maund plus the aforesaid duty. But the Salt Department were inexorable, and rather than abate their charge, destroyed the salt by throwing it into wells, running streams, etc. By the way, this salt should in itself become staple, as it is of the very best quality, and can be purchased by payment of the excise duty alone, almost. To return to the boiling liquor in the boilers. It is carefully siphoned off into a second vat and allowed to stand for an hour or so, to allow all dirt, etc., to settle to the bottom, when it is run out through troughs into cooling vats. Into these cooling vats are placed cages, made out of bamboos, divided into compartments. The liquor adheres to the bamboo branches and crystallizes. In about eight days time the liquor becomes completely crystallized into saltpetre.

In the meanwhile nothing has been lost. The earth in the filter pits, after the liquor has been drawn off in the first instance, is again filtered, and the second draw-off of liquor undergoes the same process as described above; when it is found that the liquor is becoming lighter in its colour, the earth itself is put into the boilers with the addition of water, and thoroughly mixed up and disintegrated.

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Trichy Phosphates.—90% guaranteed to pass through sieve, 1,000 meshes to square inch.

Sun-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 60 ft. by 3 ft.

Quotations and further particulars will be furnished by our Tellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS.

APPRECIATION OF AN INDIAN MIXTURE.

Messrs. CHILD & CO.,

The Wholesale Tobacconists of Chowringhee, are in possession of an autograph letter from Mark Twain.

"Indian Daily News," August 1st, 1896.

Mark Twain left a substantial memento of his visit behind him in Calcutta in the shape of a letter addressed to Messrs. Child & Co., and an old Mississippi pilot knows what good tobacco is, even when he takes to literature.

MARK TWAIN.

Calcutta, February 8th, 1896.

MESSRS. CHILD & CO.

SIRS,—This is the brand I wanted. I have smoked your Honey Dew Mixed in another part of the world, and learned to prefer it.

Truly yours,
S. L. CLEMENS.

CHILD & CO.'S HONEY DEW MIXTURE

Is prepared from the four finest growths in the world, viz:—

Sun-dried Virginia (sweet and mellow), Old Kentucky (full flavoured), Turkey Dubec (mild), Latakia (fragrant). All finely matured in bond, and judiciously blended.

It is a faultless Pipe Tobacco, being of medium strength,

WITH DELICIOUS FLAVOUR.

THE FINEST THAT CAN BE MADE. NO EQUAL.

In $\frac{1}{2}$ lb. air-tight tins, Rs. 2-8 per lb.

CHILD & CO.,

WHOLESALE AND RETAIL TOBACCONISTS,

MESS AND CLUB CONTRACTORS,

2-22, 2-23, CHOWRINGHEE ROAD, CALCUTTA.

GENERAL PRICE LIST ON APPLICATION.

PER-PHOSPHODINE, A SAFE, PROMPT AND RELIABLE PHOSPHORIC REMEDY

FOR

NEURALGIA, Nervousness, Lassitude, Overworked Brain, Nervous and General Debility, Failure of Memory, Dimness of Sight, Depression of Spirits, Impoverished Blood, Liver Complaints, &c.

This is a stable and reliable solution of Free Phosphorus (Unoxidised Phosphorus) combined with Iron, Quinine and Strychnine. It is thus a valuable and highly efficient combination of nerve tonics, and will be found admirably adapted to the treatment of all ailments which have their origin in nervous exhaustion.

It will also be found very useful in convalescence from fever and other debilitating diseases.

CERTIFICATE. "I honestly believe the Per-Phosphodine, sold by E. PLOMER & Co., to be about the best patent medicine offered to the Indian Public."

Rs. 4 per Bottle, packing charge annas 4, extra.

E. PLOMER & CO.,

HEMISTS, &c.,

LAHORE, PUNJAB.

FOR SALE

Rudge-Wedge, Quinton and Wincycles, from Rs. 185.

Ladies' Cycles cheapest in India.

Spare Gear, Lamps, Bells, &c., always stocked.

Repairs, prompt and in competition with any house.

Send for Catalogues.

R. HENDRY & CO.,

THE CITY CYCLE WORKS,

34 Dhurruamtollah Street,

CALCUTTA.

rated. After a sufficiency of boiling, the liquor is siphoned, and as before run into cooling vats. It may now be assumed that the original earth is discarded. By no means; it is thrown out into beds. This earth is most valuable, since it only needs a few months exposure, and a shower or two of rain to render it as rich as—richer in fact than—before. It is really worth its weight in gold, for after each successive course of boiling it generates less foreign matter and more saltpetre. From the cooling vats, the crystallized saltpetre is stored in dry godowns and should become business for the broker. The one item of expense in the manufacture of saltpetre is the cost of firewood; coal is out of the question, for though preferable in every way and cheap in price, the freight charged over Indian railways prohibits its use.

There are only three or four saltpetre factories in the North-West Provinces, when there might be three or four hundred. The reason for this is that its value is not only under-rated, but the secret of its manufacture is known to a coterie alone. There is practically no outlay in money necessary in opening out a saltpetre factory—a square formed by four mud walls, a few dry godowns, three or four boilers, cooling vats and a trough, and you have your factory. The labour is cheap, since it is not necessary to employ skilled workmen. It is altogether so simple that the mystery is why Europeans have not discovered the industry and worked it. Reference has only been made in this article to the North-West Provinces as a field for the manufacture of saltpetre on a scale larger than that obtaining, but there are other tracts of country in which the yield must be greater, owing to conditions of soil, etc. These are Bikaneer and Bahawalpur, in which saltpetre is the very breath of their nostrils. Who has ever heard of the desert without hearing tales in connection with the mirage. And what is a mirage? Defined in a dictionary it is “an atmospheric optical illusion,” but what causes the illusion? Nothing more or less than the saltpetre caked on the surface of the sand, after a shower of rain, or after heavy dew. Why it is that more speculation is not rife is, that the Salt Department claim every particle of salt, and as saltpetre cannot be manufactured without a certain percentage of salt being generated, the surreptitious manufacturer becomes liable to duty and prosecution by the revenue courts.

In a maund of saltpetre the following are, as nearly as possible, the proportions of parts:—

50	per cent.	saltpetre.
15	”	salt.
35	”	earth.

—“*NOMAD in Capital.*”

LETTERS TO THE EDITOR.

COFFEE IN NATAL.

SIR,—May I hope that some of your readers, through experienced planters like Mr. B. Nelson, will give me their advice on the subject of growing coffee in Natal.

Up to the present it has been a total failure. Why, I cannot quite make out. The elevation is only a few hundred feet above sea-level. The climate is hot enough certainly for coffee, as all tropical fruits attain a wonderful degree of perfection. The rainfall is 40 inches only. Tea, as perhaps most of your readers know, grows luxuriantly, though the quality is not all that it might be. I am only starting in a very small way, as besides the question of capital, the risks seem rather great, and I am moreover a thorough believer in small areas and “intense” cultivation. I am only trying $12\frac{1}{2}$ acres to begin with. The land is fairly good soil, free gravel subsoil, sloping down on all sides save one. To supplement the rainfall I intend digging tanks or wells.

The land is now planted up with pineapples and bananas (plantains). I shall nursery at once coffee of two or three varieties, but *no* Liberian; of shade also a mixture, “thornless dadaps” (thanks Mr. Editor) predominating. The first coffee planting will be (in baskets) prepared with this new patent preparation “Jadoo,” and 4 (four) feet apart; shade 12 (to be thinned out to 24) feet. The pines will be left as a catchcrop. The bananas all taken out. The second year the pines sur-

rounding the coffee and shade plants will be taken out, leaving still a pretty catchcrop. The third year the pines would all come out. There would be a small crop of coffee. The fourth year or fifth dependent on the growth of the coffee I would take out every alternate coffee tree. If by the maiden crop the coffee had made a good growth, I would thin it then. Irrigate three or four times in the year, if possible; manure with clover crops, dug in, bone and hair from a tannery in the next colony.

NATAL COLONIST.

P.S.—Labour (coloured) is here one shilling per day or £18 per annum. In a recent interview with one of the first coffee planters of the colony, I find that shade has never been even thought of.

N. C.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma contains per ton:—

61-50	lbs.	Nitrogen.
57-38	”	Potash.
14-92	”	Lime.
13-68	”	Phosphoric acid.

Orders booked for the coming crop of seed from the parent trees of above analysis at Rs. 3 per 1,000.

SHENCOTTAH,
Tinnevely.

OLD MYSORE COFFEE.

BY A VETERAN PLANTER.

I regret that owing to absence from home and other causes, I did not see your valuable publication for some time. It is however very gratifying to me to observe by your No. 33, that the subject of old coffee estates in Mysore still attracts attention, and that a correspondent, assuming the ominous name of *Chicory*!—that bane to the coffee industry, has written somewhat largely on the subject, and as I differ with your correspondent's sweeping statements, I am induced to shed a few more drops of ink on the subject, and in defence of the very fine species of coffee grown for years and that is still grown so largely in the Province of Mysore. It would be of some interest to planters if *Chicory* would be so good as to inform us why he calls the species of coffee so extensively and profitably cultivated on the old estates of Mysore “Chick.” I have always known it as *C. Arabica*. I have sometimes heard of Coorg “Chicks”—but rarely when compared with its common application to coffee grown in Mysore. Mr. Wright of Wynaad also alludes to the “chick” plant. He states at page 17 of the same number of *P. O.* that there are two varieties of coffee plants in Wynaad: “One is called Chick; these are plants whose primary branches grow rather perpendicularly.” While Mr. Wright describes the plant he calls “Chick,” he in no way connects it with the old Mysore Coffee. *Chicory* however makes no attempt to describe the plant he calls “Chick,” it is therefore impossible to say whether it is of the same variety of the Wynaad plant mentioned by Mr. Wright. I cannot however be made to believe that the plant called the “Chick” is really the coffee of the old Mysore Estates, if it was Mr. Wright writing specially about coffee would not have overlooked so important a fact when alluding to the “Chick,” which he describes as a variety—but which, if *Chicory* is correct, would be a distinct species of coffee confined to Mysore, for he rushes off with the following sweeping statement that “Everyone knows, who knows anything of the district of Mysore, that the old ‘Chick’ which was the local plant of these districts, has been virtually aban-

done, and that both old and new estates have been planted up with Coorgs," and "If the Mysore Coffee Co.'s places and Cannon's still grow the old 'Chick,' they are conspicuous by being exceptions;" and further states that "Some 15 or 16 years ago the 'Chick' plant began seriously to fail in its bearing power."

These pointed allusions to a species of coffee named "Chick" naturally leads to the belief that besides the *C. Arabica*, the original species that was introduced into Mysore, another species had subsequently found its way into the province, and in course of time exterminated the Arabian coffee, for according to *Chicory* the local coffee plant of Mysore, is the "old Chick." The local coffee was very extensively cultivated and was of only one species therefore that species must be *Chicory's* "Chick." It would be very interesting to many if *Chicory*, who seems to be in the know, would inform us how and when the "Chick" found its way into Mysore whether it is a distinct species, and why called "Chick"? (Could it be possible that its name is derived from that abominable article so commonly used in England and the Cantonment in spoiling the flavour of good coffee by its adulteration with it? What a connection!) To return to this "Chick" coffee. Is it a distinct species? It ought to be if *Chicory* is correct that the vast extent of coffee locally grown in Mysore is the "Chick," and it would also be a new species unknown to botanists. Dr. Cleghorn, a Mysore botanist, makes no allusion to this species of coffee in any of his books, nor does the genus "Chick" appear among the names of the several varieties of coffee mentioned in the "Flora of British India." Neither does Sir Joseph Hooker make mention of the "Chick" among the many species of coffee known to him. In connection with the genus coffee, it would be interesting to be told by *Chicory* of what species the Coorg plant is, which according to him has virtually driven the poor "old Chick" out of Mysore, as the young "Chick" (the "Chick" must have been young before it became old) in its time drove the original Arabian species out of the province.

Honor to whom honor is due! to some one will be due the honor of having discovered a new species of coffee grown in Mysore called the "Chick." I shall however state what I know of the locally grown Mysore coffee and of its ancient pedigree, gathered from well-established facts. On the Eastern side of the Bababooden Hills, a lofty range situate in the Mysore Province, is to be found the historical spot where about 250 or 300 years ago the first coffee seeds were sown in India. The seed was of the *C. Arabica* species brought direct from Arabia by a Fakir who came on pilgrimage to a sacred shrine situate on those hills, and which to this day is held in great veneration by both Mahomedans and Hindus. From that cradle of the Arabian coffee, not only was the whole of Mysore, but also Coorg, Wynaad, Ceylon, and other parts of India supplied with seeds, and plants, and some fifty years ago I myself sent both seed and plants to Wynaad and Coorg. At that time there was perhaps no other place in India where such fine and venerable old coffee trees were to be seen as in the Mysore province. Many of the native gardens were much over a hundred years' old, in which may be seen coffee trees with stems from 10 to 12 inches in diameter. Therefore, knowing what I know, I have no hesitation in stating that the coffee grown at the present time in Mysore, Wynaad, Coorg, and in other parts of India is of one species propagated from one parent stock, *C. Arabica*, out of the original nursery formed on the Bababooden hills, and for over half a century I have only known the fine old coffee so extensively grown in Mysore to be no other than the Arabian coffee and that no other species of coffee was introduced into the province either to my knowledge or that of the old native planters. I however trust that *Chicory*, who perhaps knows, will tell us how and when the "Chick" slipped in and took the place of the Arabian plant.

To return to the subject of old coffee estates in Mysore. I may safely state that every one of them, both European and native estates, were originally planted out with the Arabian coffee, propagated from the original stock of the species brought from Arabia, and that the majority of native planters to the present day continue to use plants raised from the good old stock. The one mistake, and it was a fatal one, made alike by European and native planters was to raise plants from seed produced on their own estates, instead of procuring or exchanging seed with some distant planter in the districts. The greater the distance between the estates, the more vigorous and healthy would the plants have been for planting out or for supplying vacancies. If this well-known agricultural practice had been followed by planters in propagating coffee from seed, there perhaps would have been no occasion for *Chicory* calling his Satanic Majesty in evidence to prove the natural failure of Mr. Jupp's local seedlings.

Notwithstanding my long residence in the province I have no pretensions for knowing any more than other planters in the district of Mysore, but from what I do know, I am fully persuaded that *Chicory* labours under some grave error when he asserts in his offhanded way that everyone who knows the district of Mysore knows that the "Chick," the local plant of the district, had been virtually abandoned, and that both old and new estates have been planted up with Coorgs, and that all green estates were replanted with Coorgs, and any estates that still grew the old "Chicks" were exceptions. I who know something of the Mysore district know nothing of the total abandonment of the old estates, nor of the other matters mentioned by *Chicory*, and my opinion is that the exceptions alluded to is just the other way. I would sooner believe that Tom Cannon had risen from his grave and shook his fist at the man who proposed to abandon his old estates than of their abandonment. If all Green's estates were abandoned and replanted with Coorgs, it must have been since 1875-76. For about that time I visited "Hoolully," his oldest estate, and only saw the fine old Arabian coffee then about 35 years' old and was neither told of nor asked to see any Coorg plants. What may have since then been done to that estate I know not.

But admitting that all Green's places, and his were the oldest European estates in the Munzerabad district, were abandoned and replanted with Coorgs, what of that? It would not constitute the abandonment and replanting of some thousands of acres of the old estates, of both European and native, with Coorgs. Knowing what I know, I am certain that no such abandonment of old estates ever took place for the purpose of replanting with Coorg plants. New clearings, vacant places in old estates, and vacancies may have been planted up with plants raised from Coorg seed, but that would only be a drop in the bucket compared with the vast extent of land that was 16 years ago under cultivation of the fine old Arabian coffee of Mysore. That is the time *Chicory* states, that the old estates of Mysore were abandoned, that would take us to about the year 1880-81. I happen to have the coffee planting statistics of the Kudu district for that year, which I give below for the benefit of *Chicory*.

Coffee holdings by Europeans ...	No. 181	—	estd. Acreage 18,51
Do. " Natives ...	13,660	do.	76,88
Do. (Inam) " do. ...	5,152	do.	30,03

Total Acreage 125,44

The only other coffee district in Mysore is the Hassan or Munzerabad district, for which an average of 100,000 acres may be taken as follows:—

European holdings	acres 25,000
Native do. "	75,000 100,00

Total for the whole of Mysore, Acres 225,44

The above figures show that in 1880—about the time *Chicory* states that the whole of the old Mysore estates were abandoned and replanted with Coorg plants—that European planters held about 45,000 acres and native planters about 185,000 acres of coffee in Mysore. Could, or would any sane person with these figures before them, and having a knowledge of them, accept *Chicory's* random statement of abandonment? If any abandonment of old estates did really take place among European planters, it may have been a few hundred acres of very bad coffee, not worth the cost of cultivation, and from my fifty years' experience of the native planters I may safely say that they are not imbued with anything approaching sentimentality; hence none of them would, for the sake of sentiment, abandon one single bearing coffee tree of those 185,000 acres held by them, be the tree ever so ill-shaped or of uncouth appearance. No, the native planter is the most unlikely person to sacrifice the tree giving him some return for the purpose of replanting it with *the handsome little tree with clean straight stems, etc.*, from Coorg, and then sit admiring it, until it yielded the much longed for coppers. A native does not look for a handsome wife, but for a hard working one, and on the same principle the native planter does not look for a handsome coffee tree, but sticks to a good bearing one! There is perhaps not even one among a hundred native planters who cares for a handsome coffee tree, and when that one is found, he would be worthy of as much admiration as *Chicory's* ideal Coorg plant.

I may further state, that so far from the old Mysore estates being totally abandoned and re-planted with Coorg plants, that at the present time there exists, in the Mysore district, acres and acres of the fine original Arabian coffee on the old estates, owned by both European and native planters. The coffee in these old estates is cultivated under shade of the original forest, I am afraid to say how old the native coffee is, but know some to be over a hundred years. Cannon's "Mylemoney" estate, the first and oldest owned by a European, was for years known as the "Annur" estate before it came into Cannon's possession. It was originally planted for a Mr. Jolly (of the firm of Parry and Co.,) who was the first European planter of Mysore, and was planted in the old native fashion so graphically described by your correspondent "Gas Bag" in No. 2 of Vol. II. This estate is fully 80 years' old. *Chicory* may write ever so disparagingly of the old local coffee plants of Mysore; he may call them "Chicks" or by any other name he likes—(with the exception of the disagreeable thing they spoil coffee with at home.) Yet the fact remains that this old estate, planted in the most primitive style, is still to the front, and produces—if I may venture to say it—the finest coffee in the world. And I hope I am divulging no secrets when I mention that a grocer at home, who deals largely in ground coffee, told me that Cannon's coffee is much used for flavouring Coorg and other description of East Indian coffee. So much for the credit of the badly-shaped ill-conditioned old local plants of Mysore. I would recommend *Chicory* to make a note of the grocer's interesting remark.

This old estate being the first owned by a European in Mysore, induces me to give a short account of its past career, which may be of interest to some of your readers. In those early days of the coffee enterprise, when such a thing as a coffee-pulper was unheard of, the berries, both ripe and green, were picked together, dried in the cherry, and then pounded out to free the bean from the covering skin of the dry fruit; this done, the enterprising planter sent his coffee down to the Western Coast, where it was carefully packed in bags made of the palm-leaf and shipped to the Red Sea, from whence it found its way to the various European Markets as Mocha coffee. After a time the "Annur" estates passed into the hands of Messrs. Binny and Co., and Mr. Norman Morison, who undertook management of the estates, but when once from home his bungalow with all in it was spitefully burnt

down by, it was supposed, Jolly's old servants, because they were not retained in service by Mr. Morison; owing to this ill-feeling towards him he returned to Madras, and I was sent to take charge of the estates. Soon after I took charge the first mutilation of the coffee tree in Mysore took place; I reduced the trees which were 12 feet high to 6 and 7 feet, and this one operation was in those primitive times called coffee-pruning. There was then only two other European planters in the Mysore district, Green and Cannon, both my seniors by two or three years, and both followed my example. In a few months the mutilated trees looked splendid, being covered with suckers from the root upwards and with new wood in abundance; the seniors were delighted and thought the last arrival a heaven-born planter—save the mark!—the last arrival knew as much about coffee at that time as a recent last arrival on an estate, who expressed his surprise to find that coffee did not grow in pods like beans. Such, however, was coffee cultivation in those early days of the enterprise. Shortly after, and not unlikely the grand results of the mutilation led to it. Mr. Morison became sole proprietor of the "Annur" estates, and as I commenced planting for myself, the management passed into other hands,—and finally into that of one of his sons. And about 1855-56, the estates were sold to Colonel Onslow, a retiring officer of the Mysore Commission; he went into partnership with Cannon, who at that time owned the "Basgode" estate. After the amalgamation of interests, the bulk of the property being situate near Mylemoney, Cannon resided there, and since then the old "Annur" estates were called Cannon's "Mylemoney" estates, and he now lies buried not far from them. This is the history of the oldest European estate in Mysore, and for all I know, will long remain in possession of the present proprietors, watched over by the shade of poor old Cannon. The "Basgode" estate is about 57 or 60 years' old. Green's estates are also about 60 years' old, and the "Arabudu coal" estate about 50 years' old. The Mysore Coffee Co.'s estates and Cannon's "Bahlur" estate are about the same age, 45 years. All these estates were planted under shade of the original forest, and have not been replanted. There are hundreds of other European estates in Mysore, but those mentioned above I believe to be the oldest in the district.

Your correspondent "Gas Bag" may turn some of his illuminating power on to the subject of old Mysore estates; he appears to know something of olden times and threw some light upon one matter, in his letter alluded to above, which I thought remained in the dark gloom of the past and only known to me; he may lighten the darkness that some of us still labour under. His remarks about the M. C. Co.'s estates is quite correct in every way; those estates in respect of aspect, soil, and forest are as good as any in Mysore, but are starved for want of funds. I do not know to what period "Gas Bag" alludes when he says they were "not looking well;" the last I saw of those estates was in 1876-77, they were then in first-rate condition.

With regard to "shade grown on estates originally grown in the open" in Mysore, I may mention that portions of Anderson's "Barguie" estate, and portions of Elliot's "Butchenhulla" estate were so treated. Middleton's "Candumonay" was also cleared "bang in the open" and fired, but whether shade was run up afterwards I am unable to say.

To return to *Chicory's* assertion that about 16 years ago all the old estates in the Mysore district were virtually abandoned and replanted with Coorg. I trust I have succeeded in showing that such was not the case. I ask what occasion was there for it? Could *Chicory* give any valid reason why either the European or native coffee planter should have abandoned, I won't say their 225,000 acres, but a single acre of their old estates, knowing as they do that no finer coffee than the produce of their old estates finds its way into the London

Market from any other part of the world. The Coorg plant may be finer, I will even say is very fine to look at, but it does not produce coffee equal to the local Mysore plant which, when properly cultivated, is equally as *handsome* as *Chicory's* ideal Coorg plant, and knowing what I know, I could tell him that long before Coorg was a recognised coffee district, some of the old Mysore estates grew as fine coffee bushes as are grown in Coorg at the present time, and on some of these old estates may still be seen very fine bushes of the original Mysore plant.

I do not know who first introduced Coorg seed into Mysore, probably Mr. Jupp did, and quite right he was in bringing in seed produced some distance from his estate; but whether the seed was from Coorg, or had been brought from some distant locality of the Mysore Coffee district, the result in my opinion would have been the same as regards his success with plants, with this difference, that the produce from the Mysore plant would be finer in quality. I do not admit that the Coorg coffee plant is of a different or better species to the Mysore local plant, both were propagated from the same pedigree, *C. Arabica*. The marked difference observed in the Coorg plant is attributable to natural causes, to the different systems of culture pursued in the two districts—that in Coorg entirely in the open, that in Mysore under shade of more or less density. These different modes of cultivation has naturally not only effected a change in the appearance of the plant, but also very materially the quality of the produce. Coffee was originally introduced into Coorg from Mysore; the seed was taken from shade grown estates to be propagated and cultivated in the open, the natural result being the growth of a hardy and fine looking plant, producing an inferior quality of coffee. While the plant improved under the open system of cultivation, the produce deteriorated in quality. This is common to all coffee grown in the open, a robust tree with inferior produce. Ceylon in its most palmy days, with its magnificently cultivated estates, was unable to compete with Mysore plantation coffee in the London Market.

While I strongly recommend that seed for all planting operations, whether for a new clearing or for replanting, or for supplying vacancies, should be brought from some distance to the place it is required for, I would at the same time suggest, that if the seed be required for shade planting to get it from a shade planted district, the further removed the better, and let it be from a well-cultivated estate of the old Mysore plant. I say this without prejudice to the Coorg seed which from the care taken with its selection and preparation there could be none better; and although the plants thrive and grow well under shade, there is nevertheless one serious drawback to it, and that is the produce from the Coorg plant though grown under shade is inferior in quality to Mysore. It is not generally known that the produce of Coorg plants cultivated in the ordinary way under shade, when sent home as Mysore coffee was classed by coffee brokers of Mincing lane as "*Coorg Mysore*," and in consequence of less value. A planter who was a great authority in coffee matters, and well acquainted with both the Coorg and Mysore districts, knowing of this classification of the Mincing lane brokers when he was about opening an estate in Mysore for himself, in preference to Coorg seed, procured the seed he required through me from the M. C. Co.'s Kelagoor estate, telling me that the Kelagoor plants were equal to any he had seen in Coorg; his venture turned out so very satisfactory that he applied to me for more seeds. He was of opinion that it would take some years before the produce of the shade grown Coorg plant would be equal to that of Mysore in quality. There are telling facts which should be noted by planters for future comparison.

In conclusion I would recommend any planter, who may have a few acres of the original local coffee of Mysore, in some distant corner of the district, to turn his crop into the prepara-

tion of seed to meet the demand for Mysore. The only seed now procurable is that prepared in Coorg, which, though good, I consider has its drawback. The appellation of "*Chick*," applied to the old local coffee plant of Mysore, is only a "*bogus*," got up for the amusement of baby planters, or of heaven-born planters, as the writer once was; do not let that deter any enterprising European or native planter from the preparation of seed from good selected genuine original Mysore coffee.

FRED. D. MEPPEN.

THE MANAGEMENT OF SOILS UNDER COFFEE, &c., IN THE MADRAS PRESIDENCY: A PRIZE ESSAY.

By THOMAS CLARKE, ESQ., TENCASY, TINNEVELLY.

II.

(Concluded from our last.)

Tips from the vine. In connection with this subject of prevention of waste, the following quotation from Baron Liebig's work upon chemistry in its application to agriculture and physiology is interesting, and very strongly supports the opinion above expressed as to the importance of saving the fallen leaves:—
"The observations contained in the following pages should be extensively known, because they furnish a remarkable proof of the principles which have been stated in the preceding part of the work, both as to the manner in which manure acts and on the origin of the carbon and nitrogen of plants.

"They prove that a vineyard may be retained in fertility without the application of animal matters when the leaves and branches of vines are cut into small pieces and used as manure.

"According to the first of the following statements, both of which merit complete confidence, the perfect fruitfulness of a vineyard has been maintained in this manner for eight years. Now during this long period no carbon was conveyed to the soil, for that contained in the pruned branches was the produce of the soil itself, so that the vines were placed exactly in the same condition as trees in a forest which receive no manure. Under ordinary circumstances, a manure containing potash must be used; otherwise the fertility of the soil will decrease. This is done in all wine countries, so that potash, to a very considerable amount, must be extracted from the soil.

"When, however, the method of manuring now to be described is adopted, the quantity of alkalies exported in the wine does not exceed that which the progressive disintegration of the soil every year renders capable of being absorbed by the plants.

"On the Rhine one litre of wine (about $1\frac{1}{2}$ pints English) is calculated as the yearly produce of one metre of land (about $10\frac{1}{2}$ feet English). Now, if we suppose that the wine is three-fourths saturated with cream of tartar (tartrate of potash), a proportion much above the truth; then we remove from every square metre of land with the wine only about 28 grains of potash.

"One vine stock on an average grows on every square metre of land, and 1,000 parts of pruned branches contain 56 to 60 parts of carbonate, or 38 to 40 parts of pure potash, and 45 grammes (about $1\frac{1}{2}$ ounces English) contain as much potash as one litre of wine. But from ten to twenty times this quantity of branches is yearly taken from the above extent of surface."

ON THE MANURING OF SOILS IN VINEYARDS.

"In reference to an article in your paper, No. 7, 1838, and No. 29, 1839, I cannot lose the opportunity of again calling the public attention to the fact that nothing more is necessary for the manure of a vineyard than the branches which they cut from the vines themselves.

"My vineyard has been manured in this way for eight years without receiving any other kind of manure, and yet more beautiful and richly laden vines could scarcely be pointed out. I formerly followed the method usually practised in this district, and was obliged in consequence to purchase manure to a great amount. This is now entirely saved, and my land is now in excellent condition.

"When I see the fatiguing labour used in manuring vineyards, horses and men toiling up the mountains with unnecessary materials, I feel inclined to say to all, 'come to my vineyard and see how a

bountiful Creator has provided that vines shall manure themselves like the trees in a forest, and even better than they.' The foliage falls from trees in a forest only when they are withered, and they lie for years before they decay; but the branches are pruned from a vine in the end of July, or beginning of August, whilst still fresh and moist. If they are then cut in small pieces and mixed with the earth, they undergo putrefaction so completely that, as I have learned by experience, at the end of four weeks not the smallest trace of them can be found."

The following notices of the same fact are from another vine grower:—

"The best manures for vines are branches pruned from the vines themselves, cut into pieces, and immediately mixed with the soil.

"These branches were used for manure long since in the Bergstand. Mr. Frauenfelder says: 'I remember that twenty years ago a man called Peter Maller had a vineyard, which he manured with the branches pruned from the vines. His way of applying them was to hoe them into the soil after having cut them into small pieces. His vineyards were always in a thriving condition, so much so, indeed, that the peasants here speak of it to this day, wondering that old Maller had so good a vineyard and yet used no manure.'"

Lastly, Wilhelm Ruf, of Schriesheim, writes:—

"For the last ten years I have been unable to place dung on my vineyard because I am poor and can buy none. But I was very unwilling to allow my vines to decay, as they are my only source of support in my old age, and I often walked very anxiously among them without knowing what I should do. At last my necessities became greater, which made me more attentive, so that I remarked that the grass was longer on some spots, where the branches of the vines fell, than on those on which there was none. So I thought upon the matter and then said to myself, 'If these branches can make the grass large, strong, and green, they must also be able to make my plants grow better and become strong and green.' I dug, therefore, my vineyard as deep as if I would put dung in it, and cut the branches in pieces, placing them in the holes and covering them with earth. In a year I had the very great satisfaction to see my barren vineyard become quite beautiful. This plan I continued every year, and now my vines grow splendidly and remain the whole of the summer green, even in the greatest heat. All my neighbours wonder very much how my vineyard is so rich and that I obtain so many grapes from it, and yet they all know that I have put no dung upon it for ten years."

Weeds. I have hitherto omitted all notice of weeds as a cause of waste, both because their amount is so various on different estates, and because on a clearing kept scrupulously clean from the first the quantity of material removed by them will not be great. The opinions of practical men as to the proper treatment of weeds vary almost as much as their amount; still, I believe, a large majority of planters would agree as to the wisdom of keeping land clean from the first, and I have no hesitation in saying it is a measure of economy second only to draining. The arguments used in favour of weeds, that they keep the soil together and protect it from the direct rays of the sun, may hold good as between two weedy estates, but as between a weedy and a clean one, a computation of the cost at which the benefits are purchased would at once turn the scale against them. On land which is already full of weeds the best method of treating them is not so obvious. In the case of rich free land where the coffee trees are large, possibly cutting down the weeds occasionally and forking them into the ground may be the most economical as well as the cheapest plan, and perhaps the soil will thereby grow richer; but on poor soils the coffee trees soon get choked out by weeds thus treated, and there seems no choice but to keep the ground as clean as possible by careful monthly weedings. If great loss of valuable material is to be avoided, they must be returned to the soil somehow, and probably burning and applying the ashes is the safest way, though at the expense of the nitrogen they contain. If some other cheap method were known of destroying the vitality of the seeds (as may be done at considerable cost by sulphate of ammonia), no doubt that would be preferable, but I do not know of any. A very interesting experiment would be the method recommended by M. Vîlè for supplying the soil with nitrogen, viz., to sow the ground with some leguminous plant which absorbs nitrogen largely from the air and does not grow to any height, and fork it into the ground before it comes to maturity. The weeds would thus be kept down, and at the same time the soil would be enriched.

To retain fertility. We now pass on to consider the restoration to the soil of the constituents carried off in crop. If we have succeeded in overcoming the large loss by waste, the drain caused by crop will be comparatively slight, and we have seen in the somewhat analogous case of vineyards, so high an authority as Liebig is of opinion that the land may be retained in fertility without the use of manure by economising the prunings, that is by restricting the drain on the soil to the produce sent to market.

There is no doubt that in this respect coffee being a perennial is differently circumstanced to the annual crops which have been the main subject of investigation among agriculturists in Europe. In the first place the annuals during the early part of their life have very small roots, and are consequently incapable of going in search of food, which must, therefore, be present in quantities largely in excess of what they actually take up. Turnips are a familiar instance of this fact. The seed being exceedingly small, a large excess of phosphates is required in the soil to produce a full crop. Perennials, on the other hand, can send their roots all through the soil in search of the required food. Again it is plain that, whatever may be the amount of food which plants absorb from the air through their leaves, a perennial with its larger surface of foliage will have a great advantage over most annuals.

It is probable that most soils are capable of improvement in respect of the particular product grown on them by increasing the relative proportion of one or more of the principal constituents, and it is certain that in the case of land which has been subject to the spoliation of wash for any time much restitution is needed; but the special conditions of each case require special consideration, after careful analysis of the soil, to see how far the improvement required can be effected at a price that will pay. At present the question we are dealing with is the maintenance of the fertility of a fertile soil, so that we may content ourselves with returning the actual constituents of the crop with such addition as will allow for the too soluble parts of the manure being carried out of the reach of the plant.

Cattle manure. As Mr. Gibson, quoted above, says: "To make good this deficiency we should employ artificial manure." But we have not the necessary knowledge. Cattle manure has been called the only perfect manure, and, as it is the only substance that can return to the land all the constituents removed from it by cultivation, the preference with which it is regarded by planters is fully deserved. At the same time it has drawbacks in its great cost and bulk. The peculiar circumstances of estates on the hill tracts of India involve, in the majority of cases, the impossibility of getting any return whatever out of cattle, so that the whole cost of stock kept must be charged to the manure. Further, about seventy-five per cent. of the weight of cattle manure is water, so that the cost of applying it, which is considerable, goes in great part to the application of matter which is not of itself valuable. Thirty-three pounds of good superphosphate and eighty pounds of nitrate of potash would contain as much nitrogen, phosphate of lime, and potash as a ton of good farm-yard manure, and yet the bulky, costly cattle manure is universally preferred to the concentrated artificial. Why?

The bulky nature of cattle manure is one of its drawbacks, but it is also one of its recommendations. That no inconsiderable part of the good it affords is due to the improvement in the mechanical condition of the soil caused by its bulk may be inferred from the change we sometimes see wrought in a field of coffee by a dose of cattle manure that has been subjected to treatment which could not leave in it much chemically valuable material.

Modes of preservation. Mr. Gibson describes "an experiment made on a large scale for ascertaining the relative merits of the different systems of preserving manure," in which "it was found that manure spread in the usual manner over open farm-yards, exposed to the weather, loses an enormous proportion of its useful materials; and, as might be expected, the loss it sustains is the greater in those materials most useful to plants. Without entering into any details of this very interesting experiment, we may remark that after twelve months' exposure, two-thirds of the substance of the manure had been wasted, while the remaining portion was next to worthless, consisting for most part of the woody matter of the straw used as litter." It is not an uncommon thing to see manure very nearly, if not quite, answering to this description applied to coffee, the owner of which "swears by" cattle manure, and yet it strikes one that he

might find some cheaper means of improving the mechanical condition of his land.

But the quality in cattle manure which especially fits it for coffee is that when fresh, thirty per cent. of its weight is insoluble in water, and a considerable part of this becomes soluble as decay proceeds, and is gradually rendered available for plants as food. Artificial manures, on the other hand, are generally valued in proportion to the degree of solubility of their constituents, since a soluble manure suits the conditions of annual crops in a cold climate such as that of Europe. Naturally, therefore, they have a tendency in the forcing climate of India to stimulate our plants into excessive action, and then being washed to a depth in the soil below the reach of the roots to leave the heavy-laden trees without the sustenance they require.

However great may be the value of cattle manure, there is a physical obstacle to its universal application on coffee estates in the cost involved in carrying it on coolies' heads to any distance up steep paths inaccessible to wheel traffic. Composts made in heaps through the clearing, with leaves, pulp, or some such substance to supply the bulk, and enriched with lime, poonac, and other valuable materials, may be used with advantage; but at best they are expensive methods of qualifying the concentrated artificials, which it is to be hoped careful experiment as to time of application, in frequent small doses, will yet show to be all we need for restoring the constituents of our crops.

The cost of manuring with cattle manure is a most variable quantity both because varying circumstances make the keeping of cattle a far more expensive luxury in some estates than others, and also because cattle manure is a mixture of most uncertain composition, so that we cannot say that in a given quantity of manure we shall supply a fixed quantity of fertilizing material.

Varying value of cattle manure. Some idea of the extent to which the value of cattle manure depends on the food supplied to the cattle may be gathered from the difference in the manurial value of various feeding stuffs taken from a table published by Mr. Lawes:—

Description of food.	Money value of the manure from one ton of each food.		
	£	s.	d.
Cotton seed decorticated ...	6	10	0
Rape cake ...	4	18	6
Linseed cake ...	4	12	6
Cotton seed undecorticated ...	3	18	6
Meadow hay ...	1	10	6
Wheat straw ...	0	12	6
Turnips ...	0	4	0

Its composition is also subject to change from fermentation, the proportion of water being about ten per cent. greater in thoroughly rotten than in partially rotted farm-yard manure; the proportion of soluble to insoluble material is also greater in the latter. It is further liable to great loss, as we have seen, from the unscientific treatment to which it is often subjected.

The analysis given above for cattle manure being an English one is undoubtedly far richer than manure produced on estates generally is; one ton of such manure would about yield the constituents contained in 3 cwt. of crop, and if we allow double the quantity for inferiority in quality, and apply, say, once in three years, we should restore the materials of the crop at a cost of Rs. 10 per acre per annum. Supposing then the ordinary expenditure on the upkeep of an estate to amount to Rs. 40 per acre per annum, to which we have added Rs. 20 for forking and manuring, we should have from a crop of 3 cwt. per acre, at Rs. 25 per cwt., a profit of Rs. 15 per acre—a small enough margin—but a very slight improvement in price would raise it to a fair figure, and there can be no doubt that coffee treated as I have described would yield, in spite of leaf disease, a higher average than 3 cwt. per acre; at the same time we should find our land growing every year richer instead of poorer, and coffee property converted from a precarious and uncertain into a lasting and solid investment.

Cultivation. We have still to consider the change going on in the mechanical texture of our soils, and the measures necessary to maintain their fertility in this respect. Under the alternation of tropical rain and sun to which estates in the open are exposed, the soil is continually growing closer in consistency and becoming less and less pervious to air and water, the free circulation of which is essential to its fertility. Air is necessary to promote the decomposition of the vegetable and

mineral substances in the soil and render them soluble, and water, which is the vehicle of all food to the roots of plants, must have free passage through the soil to bring soluble matter within their reach. Moreover, the rain brings down a considerable quantity of ammonia, which is utilized as food for the plants if the soil is free, but is lost if the soil is stiff.

We have already spoken of forking as desirable in connection with surface wash, and the expenditure of Rs. 10 per annum which was there recommended would be sufficient to keep the soil in a thoroughly free state. Soils in which the proportion of alumina is large are always stiff, and on them forking will show the best results; those which have a large proportion of quartz are naturally free, but even on these it is a good plan to spread the manure and fork it in, as it is then more evenly distributed through the soil.

I believe forking to be a most important operation in connection with leaf disease. Most planters have noticed of late years the poverty of coffee plants in feeding roots which it is natural to connect, though, so far as I know, the connection has not been proved, with the dying back of the branches caused by leaf-disease. It stands to reason that the freer the soil, the easier it is for the tree to replace rootlets which have been destroyed by any accidental cause, and that until they are replaced, the tree cannot return to vigour. It is no wonder then that forking proves beneficial. Our perennial shrubs are reduced to somewhat the condition of annual plants, and require their food finely divided and thoroughly incorporated with the soil instead of in the bulk, which suited them well enough when in rude health.

To sum up the conclusions at which we have arrived, it seems certain that soils under coffee owe the diminution of their fertility far more by waste than to the removal of material in crop. It is absolutely necessary that this waste should be prevented if the fertility of the soil is to be maintained, and it seems probable that this can be done at a cost which, though heavy, would be amply repaid. Careful experiments are needed as well as to determine this as to ascertain the most economical means of returning to the soil the material removed in crop; and it is highly desirable that such experiments should be carried out on an organized and systematic plan by all the planting interests combined rather than be left to the desultory efforts of individuals, which would take a long time to arrive at the required results.

The time has come to coffee planting, as it must come to every industry, when the margin of profit allowed by the conditions of supply and demand no longer permits careless and wasteful cultivation. The planter of India has to contend with the effects of leaf-disease on his trees at the same time that overproduction has reduced the price of coffee to a figure scarcely ever reached before, and he must meet the difficulty with all the resources that science can place at his disposal. No other country in the world offers the same advantages in cheap labour and suitable climate, so that if the time of depression acts as a spur to greater effort and stricter economy, we may well hope to see the industry emerge, strengthened and encouraged for a long and profitable career.

TEA.

Deterioration of tea.

Writing on the alleged deterioration of Ceylon tea, an old planter writes to the local *Observer*:—

"We want more knowledge—scientific knowledge. In fact we know little if anything more about tea-making than we did 12 or 13 years ago. There is no doubt that after land has been yielding tea for some time, unless under specially favourable circumstances, the quality of tea deteriorates, and one thing very noticeable is the decrease in bloom. Take carefully made tea from bushes 3 to 4 years old and look at the buds through a magnifying glass and they present a hairy appearance (like a hare's leg!) Look at tea from the same a few years after, and in most cases the appearance is a comparatively bare glistening surface. I believe this could be materially remedied if we knew how."

Russia forbidding imports of Indian tea.

Russia has announced that no further imports of tea will be allowed to enter its borders, owing to the alleged but utterly baseless danger of thereby introducing

the plague. It is evident that the action is more aimed at harming our commerce than safeguarding the health of her populations. If the Government of India were representative of the interests of the country, their reply would be simple and forcible: refusal to allow the landing of any Russian oil. For the American supplies are ample for all our needs, and the very slight increase in price would be felt by no one. We warrant this would do more to remove Russian fears of plague than the most elaborate proclamations Government can dream of. Not that we have the faintest hope that any such commonsense policy will ever be followed.

Over-grading of small breaks.

A very common failing on the part of small proprietors is to over-grade their tea. This mistake is based on the ridiculous assumption that brokers and buyers buy tea by the names rather than intrinsic value, whereas the result is only annoyance to the broker and buyer, with corresponding reduction of price. What the trade requires are "true teas." We suppose this is mostly due to ignorance of the grades really represented by the names used. Another mistake, and a more serious one, is the excessive sub-division of small consignments into a larger number of grades than the size of the consignment allows of, thus converting them into non-sampling breaks, i.e., of lots under the minimum of 20 chests or 30 half chests which large dealers will alone bid for. The remedy for this is simple. Merely send the whole consignment as one grade or break of unassorted tea, run through a number 8 sieve, leaving the red leaf and dust out. The prices are sure to be more satisfactory, inasmuch as the competition will be keener than were small lots of each grade sent separately.

Insect pests.

An Assam scientist, who is conducting some interesting experiments with various insecticides on tea, writes to ask whether we have ever noticed *Cephaleuros parasitica* (formerly called *Mycoidea*) in its deep-seated form on the branches of the tea plant. We regret to have to confess a painful ignorance as to the characteristics of this pest: perhaps some of our readers may be able to oblige? There has been during the past few years a most regrettable increase in a certain form of fungus on old and poor tea, the leaves turning silvery grey, with similar patches on the twigs and branches. Regarding the trials of Chiswick Compound, of which we hear so much in Upper India, we are informed that on analysis it proves to be merely a compound of sulphur 42 per cent. and soft soap (58 per cent.) Hopes are entertained of its succeeding on Red Spider, which in its less severe form is to be found all over the Nilgiris, and, we doubt not, elsewhere in South India. There does not seem much chance of the Chiswick mixture effecting a cure with mosquito blight, *Helopeltis theivora*. Generally speaking it may be said that sulphur, though deadly to *Acarina*, has little effect on the *Insecta*, bar *Uccidæ*, and not often on them.

Analysis of soils and manures.

Our readers will doubtless be glad to hear that Messrs. J. B. Forster and Co., of Bangalore, now undertake partial analysis of soils and manures at very moderate rates, a departure which we trust will be taken full advantage of by the planters of South India. In connection with this

subject we note that Mr. Kelway Bamber, the chemical expert formerly engaged by the Indian Tea Association, has now severed his connection with the Government of India, and has set up his laboratory in London, 9, Victoria Street, S. W. A few simple directions as to securing fair samples of soils will be of use:—

SOILS.—In 5 or 6 spots in the locality chosen, square holes should be dug to a depth of 18 inches, or to a depth indicated by a change of colour in the soil. From the sides of the holes slices should be taken four (4) inches thick, and intimately mixed on a clean surface, sticks, large stones and coarse débris being removed and noted. From the bulk about two pounds should be taken and enclosed in an airtight wooden box for transmission by parcel post. Where the subsoil differs considerably from the surface, a sample of it should be taken to any requisite depth in the manner described above. The depth of soil and subsoil, condition of weather at the time of taking and the date, should be noted with any further particulars likely to assist in drawing correct conclusions from the analyses.

MANURE.—If in bags, samples should be taken from the centre of each and well mixed, and about one pound sent for analysis, packed in airtight tins or boxes.

TEA.—For the estimation of the tannin, or essential oil, etc., about eight ounces would be required, taken from the well-mixed bulk.

Diseased roots, stems or leaves (air-dried), could be sent in airtight tins.

All samples should be securely packed and marked distinctly.

THE CHEMISTRY OF TEA.

II.

Tannin.

Touching on tannin, Mr. Crole said that gallic or dioxysalicylic acid did not possess the deleterious property of precipitating albumen, gelatine or starch, as tannin did, and since it was just as capable of imparting pungency to tea, it would seem a pity that a great deal more of the tannin was not reconverted into it. He would suggest that experiments be made in tea factories as to the effect of careful regulation of access of air and amount of heat applied during the operation of firing the tea, and that means should be tried to regulate the conversion and reconversion of gallic and tannic acids during the fermentation stage of manufacture. To tannin the pungency of tea was largely due, a valuable property from the commercial point of view. The origin of tannin in the plant was somewhat difficult to account for, but it would seem that it arose, at any rate in part, from gallic acid, though it must be mentioned that during the manufacture of tea some of it was oxidised back again into gallic acid and glucose by the action of a particular enzyme (pectase). From this last reaction it would be seen that tannin was a glucoside. When tea liquor remained in contact with air for some days a cloudiness was apparent which was due to a reaction between the tannic acid and the legumin, and the consequent formation of an insoluble and obscure compound, the astringency of the infusion being of course at the same time decreased to a marked extent. That reaction accounted in some measure for the "mellowing" of tea that was kept for a time. Freshly manufactured teas produced unpleasant symptoms when drunk, therefore they should always be allowed to mellow for at least six months. A deleterious property of tannin was that it precipitated gelatine, and formed with albuminoid matter compounds closely related to leather. When the tannin of tea (or any of the tanno-acids) was taken into the system apart from albuminoid material, it was quickly converted during digestion into glucose and gallic acid, the former being a useful food substance, and the latter at any rate less injurious than the original tannin.

Essential Oil.

The amount of essential (volatile) oil in tea was variable. It was of great importance, as, though present in such small quantities, yet its odour was so strong that it imparted a major share of the aroma and a certain amount of the flavour to tea. Owing to those volatile properties tea loses its characteristic delicate aroma if exposed to the air for any length of time. This constituent was developed to a certain extent during withering, and also during the first stage of firing. Through irrational firing, however, a good deal of it was driven off mechanically by the steam generated in the firing, or may be in part oxidised into resin. He was rather inclined to think that more than one

representative of this class of compounds (viz., volatile oils) was present in tea. He had little doubt that, if proper attention were given to the subject, a very considerable increase in the percentage of essential oil would result, and the tea consequently be greatly improved in quality. It could be extracted from refuse tea, &c., by distillation with steam; but the great difficulty in the way was the seeming impossibility in keeping it, as it so readily resinised in contact with air.

Theine.

Coming to the nitrogenous bodies found in tea, the lecturer said that various alkaloids had been discovered, and he was persuaded that yet more would be revealed by future analysis. On account of the refreshing properties due to theine, all the plants in various parts of the world that elaborated it were used for making beverages. No doubt the value of a tea should be in direct proportion to the theine it contained, but Dr. Driver found, as a result of his analysis of twenty-eight samples, varying in price from 7d to 7s, practically no more theine in high-priced teas than in common ones: for instance, in a sample of *strong* (in the technical acceptance) tea he found 4.43 per cent. of theine, and in a sample of *weak* tea, 4.35 per cent. The amount of chlorophyll present would seem to be actually a reliable index of the quality of black tea since it varied from 3 per cent. in good to 1 per cent. in common teas. What the consumer liked in tea was strength, body, and delicacy of flavour, but he cared little what amount of theine he got, for he had no ready means of estimating the proportion present; yet, if he drank tea on account of its refreshing properties, he would do well to see that he got a maximum of the alkaloid which possessed this important characteristic. Plants which were able to elaborate certain alkaloids in one part of the world either entirely failed to do so when transplanted to another part, or else only did so to a limited extent. The cocoa plant was a good instance in point. And it seemed that for this reason Chinese tea contained less theine than Indian teas. Chinese contained the least, Japanese slightly more, then Java, Ceylon, and Indian, in the order mentioned. It was popularly supposed that tannin was present in tea in inverse ratio to the amount of theine, but that was not borne out by analysis. Indian tea possessed more of both tannin and theine than Chinese teas, but it must not be inferred from that fact that the consumer imbibed more tannin in the one case than in the other, for in household use more China tea had to be put into the pot than was the case with Indian tea.

DISCUSSION.

Mr. A. K. Donald desired to elicit the views of Mr. Crole as to the infusion of tea. He wished to know whether, if tea had water poured over it quickly, and the tea was then taken away, one would get a considerable proportion of theine and very little tannic acid, or whether, if it was infused for a long time, the proportion of tannic acid would not be increased as compared with the theine. Further, he would inquire what effect carbonate of soda had if put into the water; did not that extract more tannic acid? It certainly produced a very peculiar flavour; and it had been stated in some books (particularly in Professor Johnston's "Chemistry of Common Life") that putting in carbonate of soda had the effect of getting out some albuminoids and consequently making the tea more nutritious. It would be interesting to know whether Mr. Crole had any theory upon this point.

Mr. H. E. Bristow, referring to the statement of Mr. Crole that for the fermentation of tea a temperature of 85° deg. or less should be maintained, remarked that no mention was made as to the length of time of fermentation. He would like to know whether there was any method of fixing the proper time for the fermentation process to last; was it to be determined in any other way than by the colour of the tea?

Mr. T. W. Davies said the reader of the paper had spoken of the principle of tea as an essential oil. He would like to know whether Mr. Crole had had a sufficient quantity of that essential oil to test it so as to know whether it was really an essential oil containing an hydrocarbon; might it not be a volatile alkaloid after the character of, for instance, nicotine.

Mr. D. M. Stewart asked if Mr. Crole's attention had been called to the differences of the teas of different districts. The remarks in the paper as to the cool temperature in which the fermentation should be carried out led him (Mr. Stewart) to think of the difference there was between Darjeeling and almost all the Plains gardens in the matter of flavour. He had himself noticed, when in Darjeeling, that if a cool blast of air, such as was produced by a mist cloud coming down, went over a garden as the leaf was being

plucked, as a rule the flavour was very much increased; that was what was known as the Darjeeling flavour. Mr. Crole did not seem to think that much change could take place while the leaf was growing, but this fact seemed to point in the other direction—that some change might take place whilst the leaf was growing, if there was a sudden change of temperature.

Mr. Crole, in reply, said that when tea is infused the theine is extracted very much more rapidly than the tannin. For that reason tea should only be infused for three or four minutes, in order to get the maximum of theine and the minimum of tannin; the tea-leaves should not be in the water more than four minutes. With regard to carbonate of soda, its action was, in the first place, to soften the water, thus allowing more of the flavouring matter to be extracted. Another prominent action was to diminish the astringency of the tea by neutralising, and even preventing, the solution of the tannin. He did not think it had any other action on the constituents of tea. He did not know what ruled the time of fermentation. In one garden it might be that eight hours' fermentation would be required, while the next, separated by only a fence, would not want more than two hours. The difference was probably due to soil and jât of tea. But he thought that teas should always be fermented according to their colour and smell, and not by any time method, unless, of course, they were fermented in a refrigerator. What the effect would be of a cold cloud while the leaf was being plucked he could not say; but undoubtedly a certain amount of cold during the process of fermentation was of great advantage. It was inexplicable to him that, while the tea was growing or being plucked, a cold cloud or cold blast should bring out the flavour, but he could understand that that might be the fact. Mr. Davies had spoken with regard to the essential oil in tea. There was little doubt that it was absolutely an essential oil; but there were other alkaloids, of course, in tea, and some of them had not been determined. He was himself working at the determination of one of them—not associated with the essential oil of tea, but with what was called boheic acid—and he thought he would be able to get an alkaloid from that. As he stated in the paper, boheic acid was probably not a single organic acid, but a compound of assamic acid either with another acid or with an alkaloid.

The Chairman, in moving a vote of thanks to Mr. Crole, said he was not capable of judging of the excellence of the paper from the technical and scientific point of view, but it contained some advice which he was quite sure was most useful and valuable, and which he hoped would be taken to heart. It was impossible to doubt, as was stated in the paper, that so long as the tea manufacture and similar manufactures were worked by mere rule of thumb, so long would the manufacturers fail to get the best that was to be got out of their products. The experiment was tried in Assam, for a short time, of having a chemist to help the planters generally in the process of manufacture. He had not heard what became of the experiment, but he believed it had not lasted for any length of time. It was one which, of course, could not succeed unless kept up for a number of years together; and it required an expert who should be well paid, and who would confine his whole time and labour to the study of chemical questions. He was sure that, both in the manufacture of tea and in the manufacture of indigo, such an experiment would pay the planting community over and over again. With regard to the remarks made in the last paragraph of the paper as to the cheesy smell of tea on arrival at the docks, that was an old question in Assam. He remembered that years ago there were endeavours to get rid of it by changes of boxes or by inquiries as to the chemical action on the lead, but nothing effectual had come of them. Concluding, the Chairman said he was only expressing the unanimous feeling of those who had heard the paper in offering Mr. Crole their very best thanks.

Mr. Christison said: As the Chairman had done him the honour of calling upon him to contribute to the discussion, it might seem ungracious on the part of one who had been so long connected with the production and manufacture of tea, unless he stated that it was not the want of interest in the subject or of will that made him diffident in rising. He thoroughly agreed with the Chairman as to the vast importance to the tea-planting industry of having scientific assistance. So important an industry ought to employ scientific experts continuously; but great care must be taken to engage those most suitable and competent for the necessary investigations. He felt that as the paper was of so technical a nature he was not competent to express any opinion as to its merits. In reference to the least scientific portion of it, which treats of the chemistry of the

process of manufacture, if the opinions expressed on the more practical points are deductions from Mr. Crole's independent scientific investigations, all that he could say was that, so far as they go, they tend to confirm the commonly approved practice in the tea districts, and what has been that practice for a very long time. Though on the technical points he was not in a position to speak, he had no hesitation in saying that thanks were due to Mr. Crole for devoting himself to scientific research.

DISTRICT ASSOCIATIONS.

COORG.

PROCEEDINGS of the Quarterly General Meeting of the Coorg Planters' Association, held at the Bamboo Club, Pollibetta, on Wednesday, 3rd March, at 2-30 P.M. **PRESENT:** Messrs. E. M. Breithaupt, G. Davies, W. Davies, D. A. Donaldson, J. W. Finlayson, F. W. Gerrard, H. G. Grant, A. Johnston, O. Jones, R. Kaundiniya, John Logan, H. Marriott, R. D. Tipping, W. Wright, and H. G. Parsons, *Honorary Secretary*; Mr. H. S. Wood, *Visitor*.

MR. JOHN LOGAN, *President*, in the Chair.

New Member.—Proposed by the Honorary Secretary, seconded by the President, that Mr. Marriott be elected a member. Carried *nem. con.*

Deputation to Chief Commissioner.—The Honorary Secretary read the annexed statement with reference to the subjects discussed. Proposed by Mr. Breithaupt, seconded by Mr. Tipping, that the thanks of the Association be conveyed to the deputation for their services.

Land Record Cess.—Resolved that the Honorary Secretary be instructed to write to the Commissioner of Coorg, asking whether the Land Record Cess is intended to be a permanent charge.

Mr. Leslie's Transfer.—Resolved "That the thanks of the Association be conveyed to Mr. M. Leslie, late Ex. Engineer, for the excellent manner in which he constructed and maintained the roads and public works in Coorg, and that the Association regrets the Government of India have not seen fit to extend his services to the Province.

"In wishing Mr. Leslie every success and the promotion he so well deserves, this Association do cordially endorse the following remarks of Mr. Mackworth Young, late Chief Commissioner of Coorg, in his review dated 30th November 1896:—

"The Chief Commissioner desires to record his appreciation of the energy and skill with which Mr. Leslie has performed his duties during his term of office."

Resolved that the Honorary Secretary do forward a copy of the above resolution to Mr. Leslie through the Secretary to the Chief Commissioner of Coorg.

U. P. A. S. I. Circulars—Famine Fund.—Read letter from Secretary, U. P. A., re "Famine Fund."

Resolved that a subscription list be started amongst members of this Association, and that all donations be remitted collectively from the Coorg Planters' Association.

Coffee Association.—Read correspondence, and resolved that while approving the resolution of the Shevaroy Planters' Association, this Association is of opinion the question be left to the U. P. A. and its representatives in London.

Member of London Chamber of Commerce.—Mr. Mangles having accepted office was noted with pleasure.

Lady-birds and Bug.—Read letter, and recorded.

Coffee and Duty in London.—Read correspondence on the subject between representative in London and Secretary, U. P. A. Recorded.

Exemption of Duty on Manures and Tea Seed.—Read letters. This Association is unable to furnish reliable figures as to nitrate of soda imported, but the Agents in Madras and West Coast can doubtless do so.

Charges on Coffee in London.—Read circulars. Resolved that the representatives of the U. P. A. on the London Chamber of Commerce be strongly supported in any action they may deem advisable.

Committee of Inquiry.—Read confidential letter from Chairman, U. P. A. Recorded.

Malarial Parasite.—Read and recorded with satisfaction circular from Secretary, U. P. A., stating that the Government of Madras had addressed the Government of India with reference to the appointment of an expert for the investigation of this subject.

Individual Members of U. P. A.—Read circular from Chairman, U. P. A. Resolved that this Association cannot guarantee the

number of members until it is known what the subscription and rights of private members will be.

The Honorary Secretary explained certain modifications that he was prepared to accept to meet the views of those who were partially opposed to the measure, and he would draw up his modified scheme at an early date and forward same to the Secretary, U. P. A., for circulation and discussion.

Resolved that this Association considers a limited number of members from each Association according to present proportion of votes should, as a tentative measure, be admitted to membership of the U. P. A. and approves the modified scheme of the Honorary Secretary which meets all objections so far raised.

Act XIII. of 1859.—The Honorary Secretary informed the meeting that the Government of India had instructed District Judges and Magistrates to refer cases, when opportunity offered, to the High Court, Madras, with reference to the procedure in issuing warrants under the Act. This Association had already forwarded a case from the file of the District Magistrate of South Canara to the Secretary, U. P. A., who had retained Messrs. Wilson and King to watch the interests of the U. P. A.

Address to the Queen-Empress.—Resolved that an address from the U. P. A. as suggested by the Chairman be approved.

Shooting in Government Forest.—Read letter from Secretary to Chief Commissioner. Recorded with satisfaction.

Timber Charges.—Read letter from Commissioner of Coorg stating that the charge on bamboos has been reduced and that the rule for sale of timber trees had been amended as desired.

Theft of Coffee Plants.—Read letter from District Magistrate of Coorg. Resolved that a reward of Rs. 5 be given to the constable in question.

Coorg-Tellicherry Post.—Read letter from Postmaster-General stating that arrangement had been made for letters posted in Coorg one day to reach Tellicherry the next, and *vice versa*.

Mail Tonga Service.—Resolved that the Honorary Secretary be instructed to write to the Postmaster-General and Government Mail Contractor pointing out that the most favourable route will be from Hunsur *via* Arnichowk, Tettimati, Pollibetta, Ammatti, Siddapur to Mercara, and that this should be considered before completing the new contract and subsidy.

Coffee Stealing Funds.—Read letter from Chairman, Mr. F. W. Gerrard, resigning office of himself and Committee.

Resolved that Messrs. F. W. Gerrard, A. H. Jackson and Honorary Secretary be asked to act.

Motor Car.—The Honorary Secretary informed the meeting that he had received full particulars from Mr. Wood, and had had an interview with that gentleman who was present that day to state his case to the members.

Mr. Wood briefly informed the members of his intentions and said that he had had an offer from the present Mail Contractor to take over his service from 1st November next and asked the Association to use its influence to secure him the Mail service and subsidy. Resolved that if Mr. Wood is able to successfully prove his scheme, he will be heartily supported by this Association.

Bazaars in Coorg.—The Honorary Secretary brought to the notice of members the quantity of inferior grain and rubbish that was sold to coolies, and more particularly the number of old and diseased cattle that were imported every bazaar day and bought and consumed by coolies to the detriment of health. Such cattle were also a means of introducing various forms of cattle disease. Resolved that the Commissioner of Coorg be addressed as to what measures should be taken to abate such nuisance.

Weights and Measures.—The President pointed out the inconveniences from the use of several different measures and weights in Coorg. Resolved that the Commissioner be addressed.

Petty Shops.—Resolved that the attention of the District Magistrate be drawn to certain huts where it is suspected illegal liquor is sold.

In conclusion the Honorary Secretary suggested to members that it would perhaps be of advantage if the Association occasionally had an extraordinary meeting to discuss questions solely on the subject of the cultivation of their industry, such as the different experiences gained as to digging, pruning, manuring, etc.

Interesting views were sometimes exchanged at the meeting of a few at private residencies which, if discussed and debated at a special meeting, might possibly lead to interesting results. The meeting approved.

The following papers were laid on the table:—

Wynaad Planters' Association, 6th January 1897.

Nilgiri Planters' Association, 21st January 1897.

P. W. D. Coorg Adm. Report for 1895-96.

With a vote of thanks to the chair.

H. G. PARSONS,

Hon. Secy.

Annual General Meeting, Mercara, end of May.

WYNAAD.

PROCEEDINGS of a General Meeting held at Meppadi Club on March 3rd, 1897. Present: Messrs. Abbott, H. Atzenwiler, Beachcroft, R. Lamb, B. Malcolm, F. R. Malcolm, F. S. Malcolm, C. A. Mackenzie, Mackinlay, Robinson, Romilly, Taylor, Trollope, Waddington, H. B. Winterbotham, Wright, and Mr. Hockin, Honorary Secretary. Mr. G. Romilly in the Chair.

1. *Proceedings of the last meeting* were taken as read.

2. *New Form of Contracts*.—Read letter from Mr. Winterton promising attention to the matter.

3. *Roads*.—Read letter from the Honorary Secretary to Government forwarded through the Collector of Malabar and the Collector's endorsement thereon; also extract from the Budget Report of the Malabar District Board for 1897-98. Recorded with satisfaction.

4. *Coffee Passes*.—Read Demi-official from the Superintendent of Police, Malabar, pointing out how very important it is that passes should be always accurately made out, as the system of passes is a

factor in the prevention of Coffee stealing on the road, which planter would do well to make the most of. At present many are inaccurate. Sometimes the signature, sometimes the date or some other important particular is omitted which makes the pass valueless.

5. *Remuneration of Police on Special Duty*.—Read Honorary Secretary's letter to the Inspector-General of Police and the latter's reply. Recorded with satisfaction. The chairman proposed that Rs. 150 be paid to the police as last year as a reward for the successful effort of the police to prevent coffee robbery. Carried.

6. *Nomination of Member of the District Board*.—Read letter from the President, District Board, announcing Mr. Walker's resignation and requesting the Association to nominate another gentleman for the post. The Honorary Secretary was instructed to forward the name of Mr. J. W. Hockin as the Association's nominee.

7. *Outturn of Coffee*.—Read letter from Captain Carslake, R.N. The Honorary Secretary was instructed to thank Capt. Carslake for his letter, and to point out that Europeans are employed to check the measurement of coffee in the curing yards, and that seamless bags are obtainable through the agents; but the Association think that it is practically impossible to arrive at any fixed standard of moisture in Coffee applicable to Wynaad, the Coast and London.

8. *U. P. A. S. I. Circulars*.—(a) *Purchase of Bark*.—Read circular quoting endorsement, No. 707, Rev. Dept., Madras, informing the Secretary, U. P. A. S. I., that Govt. has authorized the Director of Cinchona Plantations to invite tenders for such quantities of bark as may from time to time be required to supplement the existing yield of the plantations, but that no guarantee can be given as to the quantity annually required, or the prices which will be sanctioned. Recorded with satisfaction.

Planters' Library.

Please note that purchasers will effect a saving by sending a M. O. or stamps for the price of the books, plus one anna on the rupee for packing. The value payable commission and registration fees will be saved, while the postage being charged bearing (at the same rates as if prepaid) will ensure safe delivery.

Investors should consider the meaning of a MONOPOLY of a material coming into general use for growing "supplies" for and Coffee Gardens in the Tropics, or replacing Vines in one single district in France, and judge for themselves as to the return they are likely to get on Capital invested in this Company, bearing in mind that the raw material used to make JADOO is practically inexhaustible, and that as trade increases the prime cost will steadily decrease, as labour will not form nearly so large a proportionate item on a large trade as on a small one.

Full Prospectus, with Testimonials from all parts of the World, on application to PARRY & Co., Madras.

(b) *Famine Fund*.—Read three circulars forwarded by the Secretary, U. P. A. S. I.

A list was circulated in the room and Rs. 520 promised.

The Honorary Secretary was instructed to invite further subscriptions from members of the Association not present.

(c) *Import Duty on Tea Seed*.—Read letter from the Chairman, U. P. A. S. I. The meeting approved of the opinions expressed by the Chairman, U. P. A. S. I., and the Honorary Secretary.

(d) *Coffee Adulteration*.—Read circulars forwarded by the Secretary, U. P. A. S. I. Recorded.

(e) *Individual Membership of the U. P. A. S. I.*—Read circular from Secretary, U. P. A. S. I. Recorded.

(f) *Warrant issued under Act XIII, 1859*.—Read circular containing letters from the Hon'ble Mr. H. P. Hodgson and Chairman, U. P. A. S. I., and Counsel's opinion on the legality of search warrants. The meeting cordially endorsed the letter from the Hon. Secretary to the Secretary, U. P. A. S. I., approving the Hon. Mr. H. P. Hodgson's opinion.

(g) *The Queen's Jubilee*.—Read circular proposing the presentation of an address to Her Majesty by the U. P. A. S. I. and draft of the same. Cordially approved.

(h) *Coffee Association*.—Read circular on the proposed formation of an Association to promote the sale of Coffee. Recorded.

9. *Act XIII. of 1859. Contracts*.—The Hon. Secretary stated that Mr. Powell had sent him contracts in which it was provided that the advance should be repaid by the Maistry and which the Second Class Magistrate had assessed for stamp duty as bond for repayment of money cognisable only by a Civil Court. To bring a contract under Act XIII, it must be provided that the advance shall be recovered by the master out of wages and not repaid by the servant. The use of the word "repay" should be avoided and the word "recover" substituted.

10. *New Member*.—Mr. J. W. Handley was elected a member of the Association.

11. *Papers on Table*.—Proceedings of a monthly Committee meeting, the Quarterly general meeting, and a Special meeting of the Kavaray Planters' Association, January 1897.

Proceedings of the Nilgiri Planters' Association, January 1897.

" " Central Travancore Planters' Association.

Annual General Meeting, 1897.

12. *Timber Defence Fund*.—Mr. Atzenwiler stated that the final appeal to the High Court against the decisions in his favour in three other courts had been rejected. Recorded with satisfaction.

13. *Annual Meeting of the Medical Fund Subscribers*.—The Acting Secretary read his report on the working of the Fund for the last year and laid his accounts on the table. The latter showed a balance in favour of the fund of Rs. 520. Approved. A cordial vote of thanks to the Acting Hon. Secretary for his able management of the affairs and finances of the fund and to Mr. Romilly for the trouble he had taken in securing the services of a new Doctor in England was passed.

Messrs. J. R. Malcolm, Mackinlay, Romilly, Lamb, Hockin, Winterbotham and Waddington were elected members of the Committee for the management of the Medical Fund during the coming year.

RESOLVED:—That the Committee be requested to consider the expediency of putting the subscriptions to the Medical Fund on the basis of a fixed rate for each estate for each acre under cultivation; and in the event of such an acreage assessment being found feasible, to endeavour to arrange for a cess which will enable the Committee to make more complete provision for the wants of the district.

14. A vote of thanks to the Chair closed the proceedings.

(Signed) G. ROMILLY,

Chairman.

(Signed) J. WILLIAMS HOCKIN,

Honorary Secretary.

NORTH MYSORE.

PROCEEDINGS of the Annual General Meeting of the North Mysore Planters' Association held at the Balehonore Club, 1st March 1897. Present: Digby T. Brett, President, representing Estates Hutton Kodigi, Bandara and Belcode; F. S. Hay, Hon. Secy., Kotordi; H. Browne, Kerkie, Coondah-Serraputty, Allegeshware, Yellimudoo, and Guditota; H. Pilkington, Koppa and Doobla; O. Scot Skirving, Yellagode; C. Danvers, Kalagoor and Hulsoor; F. Clifford, Murguddi and Arabidycoll; E. Clifford, Balihonnur; H. A.

Campbell, Netrakul; F. Parton, Siddra Bennoo and Henchi; A. J. Lipton, Kundera Goondi; H. M. Northey, Gooty Kan; C. C. Harvey, Herrigudda; W. H. Lincoln, Jeccan Kodigi; H. G. Bonner, Merkul; D. O. Allardice, Gubgull; C. P. Reed, Merthikan; W. A. Bidie, Badui Kan; W. Maxwell Maynard, Quard Hitlow; L. D. Colledge, Halgar.

The following Estates were represented by Proxy: Gooboor, Kircassia, Kesinverthi, Bupponji, Hospet, Dereel, Bibbenluke, Isabel, Guntanaick, Kannalla, Sooboongoodigay, Davara Kan, Kulsapur, Barekodi. Visitors: H. Edington, W. Thompson.

Proceedings of the last General Meeting were taken as read and confirmed.

The Annual Report was read by the Secretary, ordered to be printed and circulated.

The President, Mr. Digby T. Brett, then addressed the Meeting. Ordered that the speech of the President be printed and circulated with the proceedings of the Meeting.

In discussing the Annual Report, the Secretary was instructed to add paras. giving the opinion of the Meeting upon the present state of the Roads, the transfer of the Cutcherry from Hurriapur to Koppa, and the necessity of a branch railway to Chikmagalur.

Mr. Brett's proposal of a vote of thanks to Mr. F. S. Hay, seconded by Mr. Maxwell Maynard, was carried unanimously.

The Meeting then proceeded to the election of the Committee to hold office for the year 1897-98, and the following members were elected:—

O. Scot Skirving, President; Messrs. Brett, Hay, Browne, F. Clifford, Danvers and Pilkington.

Mr. Hay then addressed the Meeting with regard to the subscriptions to be paid by subscribing Estates for the year.

Proposed by Mr. Hay, seconded by Mr. Danvers:

That this Association re-affirm the proposals made at the last Annual General Meeting, and that this Association shall subscribe for the year 1897-98 the sum of Rs. 625 to the Reserve Fund of the United Planters' Association, and the sum of Rs. 375 to the current account of that Association.

In order to raise the necessary funds required by the North Mysore Planters' Association, Mr. Hay proposed and Mr. Brett seconded that in future the subscription to this Association be at the rate of 2 as. 6 pies per acre cultivated with coffee, cardamoms or tea, and 6 pies per acre for every uncultivated acre of land belonging to an estate.

That the maximum subscription to be payable by any one estate shall be Rs. 75, the minimum Rs. 15.

That members who subscribe to this Association without owning land pay annually Rs. 15.

That each complete sum of Rs. 15 paid shall entitle the subscriber to one vote.

Amendment proposed by Mr. Danvers, seconded by Mr. F. Clifford raising the maximum to Rs. 90 was discussed and finally disapproved.

Another amendment proposed by Mr. Maxwell Maynard, seconded by Mr. H. Pilkington, reducing the tax from 2 as. 6 pies on cultivated area to 2 as. was lost.

The question of Individual Membership to the U. P. A. was then opened by Mr. Hay, and his proposals were seconded by Mr. Browne.

1. That Individual Planters and Estates be allowed to join the U. P. A. S. I., and shall be entitled to all the privileges of membership on payment of the subscription.

2. That each member shall pay an annual subscription of Rs. 10 payable at the commencement of the official year of the Association.

3. That no member whose subscription is more than six months in arrears be allowed to exercise a vote.

4. That each District Association shall have one vote for every Rs. 10 of annual subscription.

5. That no votes by proxy be allowed to Individual Planters or Estates.

Mr. Brett addressed the meeting traversing the arguments of Mr. Hay, and showing how under certain contingencies such membership might undesirably affect the voting at the U. P. A. Meetings and concluded his remarks by proposing:—

That this Meeting of the North Mysore Planters' Association is of opinion that individual membership in any form to the U. P. A. is undesirable, and that its constitution should remain as it is, an Association of Associations.

Other gentlemen having spoken, Mr. Brett's amendment, seconded by Mr. Danvers, was finally carried by 30 votes to 5.

Coffee Association.—Resolved that it is not at present advisable to form such an Association.

Read proceedings of the Sub-Committee of Santaveri.

Delegate for Dussara Assembly.—The Committee were authorised to nominate a member.

The proceedings closed with a vote of thanks to the Chairman.

(Signed) O. SCOT SKIRVING, PRESIDENT,
N. M. P. Association.

ANNUAL REPORT.

GENTLEMEN,

Your Committee have much pleasure in laying before you the Annual Report and Accounts for the year now ending.

	RS.	A.	P.
We began the year with a credit balance of ...	1,256	6	6
We received from subscribing estates ...	1,778	13	7
From interest and sundries ...	26	11	6

Making a total of Rs. ... 3,061 15 7

Our expenditure under all heads amounted to ... 1,812 6 0
Which leaves us with a credit balance of ... 1,249 9 7
or very nearly the same as we began the year with. We regret to state that certain estates (Santaveri, Ambady, Hadwoni, Hutchen Hachloo and Mylemony) are in arrears for either the whole or part of last year's subscription; had they paid up we should have had a surplus, as we ought to have, to add to our reserve fund.

Included in the expenditure you will note Rs. 125, subscribed to the U. P. A. 1895-96 account, and Rs. 625, subscribed to the U. P. A. Reserve Fund. As regards the former item, the executive of the Head Association found it necessary to make this call to which all District Associations responded, in order to clear off outstanding claims. At the last General Meeting held in Bangalore the ordinary Annual Subscription was raised 50 per cent.; our subscription therefore is now Rs. 375 instead of Rs. 250. You will remember that last year Mr. Acworth brought forward a scheme raising a large amount by voluntary subscription to place the U. P. A. on a sound financial footing.

The opinion of this Association as expressed at a General Meeting held in June last was that though it approved of Mr. Acworth's scheme in principle it did not agree with it in detail. We considered that it was necessary to form a Reserve Fund for the U. P. A., and suggested that a sum of Rs. 5,000 should be annually raised from the District Associations in addition to the ordinary subscriptions; that each District Association should collect its share in the manner it deemed most suitable, and that the voting at the General Meetings of the U. P. A. should be regulated according to the amounts subscribed. Your delegates accordingly brought forward these propositions, but as you will see by referring to the Report of the U. P. A. Meeting, they were not carried, and under the circumstances it was deemed advisable not to press the matter, though notice was given that the question of voting power might be brought up again.

Your delegates subscribed in the name of this Association the sum of Rs. 625 towards the U. P. A. Reserve Fund for this year, and though they intended that this should be an annual subscription, they did not absolutely pledge themselves in the matter.

Subscription lists for donations towards the U. P. A. Reserve Fund were circulated among you as requested by the executive, but as members did not respond, it is now for you to settle what our policy is to be for the next year, what sum we are to subscribe, and the manner in which it is to be raised.

There is another question on the Agenda paper, that of individual membership to the U. P. A., which will come up for discussion later on. We would merely remark here that we cannot admit that what Mr. Hodgson is reported to have said at a meeting of the Nilgiri Planters' Association, namely that the principle had been already accepted by the U. P. A., is the case: It is for you now to express an opinion for the guidance of your delegates at the next meeting, when the matter will probably be decided.

As regards subscription of estates to this Association, you will remember that at a General Meeting held at this Club in June last we agreed to a crop tax of Rs. 2 per ton. Nearly every estate, though we regret not quite all, responded to this call. We would especially urge on all members the necessity of unity. In an Association like ours it is impossible to fall in with the views of every one, and whatever course it is decided to adopt, we trust that all, no matter what their private opinions may be, will loyally support resolutions passed by the majority.

The past year has been one of unusual importance in the history of the Planting Industry of S. India. The Government of India, in response to a request made by the U. P. A., appointed a committee of enquiry to investigate the question of Planters' grievances. The committee forwarded its report to the Government of India last autumn, and though the result has not been made public yet, we have every reason to hope that from the evidence laid before it, the Government of India will see the necessity of introducing some measure to remedy our jurisdiction difficulties. Our thanks are due to our late Resident, Mr. Mackworth Young, I. C. S., for the

exceedingly able manner in which he presided over this committee enquiry, and for the great interest he took in all matters relating to Planters. Your President wrote to Mr. Mackworth Young on his departure, and in the name of this Association expressed our thanks for the sympathy he always displayed towards Planters in Mysore.

We have lost also during the year the services of Mr. Sparkes, who for six years was our Deputy Commissioner, and who during that period proved himself to be an able official in all matters relating to Planters, and whose departure we greatly regretted. In Mr. Weir, his successor, we have an officer of many years tried experience, and we feel convinced that our interests will not suffer under his regime.

We regret that it is impossible to give a favourable report for the past season. An unusually long drought in last hot weather, followed by an abnormally heavy monsoon, has resulted in disaster to many of us, and crops have been generally the smallest on record. This has not only been the case in coffee but also in other produce such as supari and cardamoms. We can only hope that the coming season may prove more favourable, and that bumper crops in 1897 will enable us to retrieve the losses of 1896.

While most sincerely regretting the scarcity and famine in certain parts of India, we are glad to state that there does not seem to be a likelihood of famine in these parts. There was a scare last October when grain went to famine rates, but fortunately it did not last long and prices soon fell again to nearly the normal rates.

Your attention has been called by circulars to the subscription list towards the Famine Fund. We feel sure that you will all admit that it is our duty to subscribe to the best of our ability towards the fund, and we invite the special attention to it of all those who have not already subscribed.

We are glad to be able to report that two works which we have always strongly advocated, the extension of the Railway from Birur to Shimoga and the erection of a bridge over the Bhudra at Tadsa, are now in active progress.

The projects for the establishment of a Sub-Taluk headquarters at Bahonore, and of a Civil Court either at Tarikere or Chickmagalur for the benefit of residents near those places, are still under the consideration of the Government. We hope to see these desirable changes carried out before long.

Roads and Communications.—The roads in the District still require the closest attention by the officials of the D. P. W. Owing to the energy and hard work of Assistant Engineer Mr. Bore, some improvement has taken place within his sphere of control and more results would be shown by him if his subordinate staff were increased and were in our opinion more reliable. The state of the road through the Luckwalli jungle is so disgraceful, for though metal has been put down in a perfunctory manner it has already been cut up by traffic, and unless the side drains are immediately attended to, the state of the road will be as bad as ever in the coming monsoon. It is to be hoped more attention will be paid to the cutting back of the jungles on either side of the road, as the drip from overhanging trees largely contributes to the present bad state of the roads.

It would also be advisable to address Government on the necessity of the annual sales of the contracts for the Ferries being made at such a date that the incoming contractor may have all his arrangements made to begin work on the 1st June in every year.

We regret to inform you that though we believe sanction has been given for the transfer of the Amildar's Court and Taluk Treasury from Hursapur to Koppa, still nothing has been done. The delay is most deplorable and annoying, especially so owing to the roads being infested with Dacoits, whom the united efforts of the Police and some Government Sowars seem utterly unable to cope with, resulting in a general feeling of insecurity among the inhabitants of certain Taluqs. The present state of the roads, infested as they are, makes travelling unsafe and brings home more than ever the necessity for the transfer of the Treasury to a point nearer the centre of the parts to which it is of most importance. At present it is unsafe to send unarmed men to the Hariapur Treasury for money necessary for the payment of our coolies.

We are glad to note that the Birur Shimoga Railway is under construction, and we would strongly urge the necessity of a branch line to Chickmagalur—a town centrally situated for the whole of the Planting District.

In conclusion, there is one point to which your attention is desired. Great many members are most dilatory and careless in answering circulars sent out by the Honorary Secretary. Last November you were asked to furnish statistics as to the amount of nitrate of soda and other chemical manures imported for fertilizing purposes. In many cases no answer was sent, and in others members only sent returns after a lapse of several months.

We must impress on you, therefore, the importance of answering, and that quickly, questions like these, which are for the general good.

We now ask you to proceed to the election of a President and Committee for the ensuing year, and also to elect a delegate to represent you at the Mysore representative assembly.

Since the above was written, we have to lament the loss of one of our members, Lieut.-General Leslie, late Inspector-General of Artillery in India, who after a distinguished military career settled down among us as a Planter. We feel sure that you will all join with us in expressing our sympathy with his family at the loss they have undergone.

(Signed) F. S. HAY,

Honorary Secretary.

[We greatly regret that pressure on our space forbids us reproducing the interesting speeches of Messrs. D. T. Brett and F. S. Hay annexed to the Report.—ED.]

SHORT STORY.

"DEATH HIS BRIDE."

A Tiger Story.

THE long Indian day had come to an end, the sun had sunk in golden splendour, leaving in his wake streaks of dusky red—changing anon into bronze. I had just come back to my bungalow, after having been out nearly all the day down in the fever-stricken district that lay at the foot of the little hill on which my bungalow was perched. I had had an extra busy time of it that day, for cholera, and fever of a malarious type were raging amongst the natives, and were spreading in an alarming manner among the Europeans as well, and being the duly medical man within a radius of twenty miles, I had my hands pretty full; so I was thankful when my work was done, and I was able to enjoy a rest in my arm chair, and lately I had hardly known the word *rest* in its practical sense. As I sat smoking and watching the sunset sky—and there is no sunset to equal an Indian one—my thoughts took unto themselves wings, and carried me back to the old Homeland, and to those dear dead days of long ago; and as my fancy dwelt once more among the old familiar scenes of my boyhood's home, and the dear ones who had helped to make that home so happy, I felt a great yearning to get back to it all again.

Then the recollection of a fair girlish face took possession of my brain, and when I thought of the love that bound us to each other, and that some day that sweet face would be my own, I felt that I must do all in my power to bring that day to a nearer certainty; and the very thoughts of the happiness which the future held in store for me sent a thrill of pleasure through my frame, and then I began to think what I would do when *she* came to join me in fighting this world's battles, of the various improvements I would make in the old bungalow, and last of all what joy it would be to find a bright little wife waiting to welcome me home after a hard day's work—and a hundred other such delightful (to me) speculations regarding *her*, when my dreams were rudely broken in upon by the entrance of that indispensable factotum of every Indian household—the "boy"—bearing a tray on which lay a letter, and gravely announced that it was from "Dunbar Sahib," and then waited to see if I had an answer to give. I hastily tore open the letter, thinking it was a call to see a sick case on Dunbar's estate, which was about fifteen miles from my place, and as I was the nearest medical man to the coffee plantations on the—hills, I consequently had often been called up by the planters to attend to them and their coolies in cases of sickness,—but the letter contained just these few lines—"Dear Dare,—I am obliged to go down to M—s to meet my fiancée, Miss Farrel, who is expected out in the steamer that arrives from home next week. I leave this to-morrow and am writing to ask if you could kindly put me up for a night. There's a tiger about my place, but have no time to go after it. More when we meet.

Yours, &c.,

RICHARD DUNBAR."

Dunbar was a special friend of mine, and a general favorite in the district. He owned one or two of the finest coffee estates on the—hills, was a splendid sportsman, had more than his share of good looks, and all this, combined with the fact that he was very well off, helped to spread his popularity a good bit. That he was shortly to be married, and that the young lady was expected out from home, I was fully aware of, and to the reason of his having to go to M—s was not a surprise to me; so going to my desk I wrote him a "chit" to say that I would be delighted to put him up on the following night. My Anglo-Indian readers will readily understand the

unceremonious way friends are apt to drop in at one's bungalow and ask you to put them up for a night, or whatever the case might be, at the shortest possible notice; and I think that one of the great charms of the very few that this country possesses is the unconventional bearing that we have towards each other. Indian hospitality being proverbial, and I rather think it is the same in all colonized countries—however this is a digression; well, after having instructed the "boy" to get a room ready for the next day's expected visitor, I returned to my long arm chair to finish my interrupted smoke. I had not sat down for many minutes, when I heard most unearthly yells and shrieks proceeding from the servants' quarters. Presently my "syce" came running up quite out of breath with fear and excitement, and ejaculated in broken sentences that a "burra bagh" had just walked away with one of the servants' dogs that had been lying outside the door of its owner's house; and would not the "Sanib" come and shoot the tiger; but not being a particularly keen sportsman, coupled with the fact that I was dead tired, I said no, and dismissed the man with the injunction to have the dogs tied up every night. I retired to bed early that night, but was unable to get much sleep; I seemed to be over tired, and when eventually I did drop off into a doze, my brain was tortured by all manner of horrid nightmares, of people being chased by rogue elephants, and torn to pieces by man-eating tigers, Dunbar and myself seemingly being the victims of these dream tragedies; and when I was awakened by my boy for my morning cup of tea and cold tub, I felt thoroughly worn out both in mind and body. I was busy enough all that day, and when I returned home in the evening I was "dead beat." Dunbar had already arrived, and after having exchanged greetings, we sat, and talked, and smoked till dinner was announced. I was quite glad to have a companion for my usually solitary meal, and Dunbar was such a bright chap, he always had so much to talk about. He was full of what he was going to do when he was married; it appears that he was engaged before he came out to India, some four years ago, and was of course looking forward to seeing his sweetheart again with much pleasure; "and you know, old chap," he said at the conclusion of the recital of his love story, "she is such a little brick, she has had awful long odds against her, for her people wanted to marry her to some Johnny with a handle to his name, but my little girl stuck to me through thick and thin; and patience won the day, and me the best girl in the world." Poor Dunbar! how well I can remember the lingering tenderness of those last words of his, they still ring in my ears though years have past since that night. I fully sympathised with his feelings, for I myself was deeply in love with a certain little blue-eyed English girl, and was duly waiting for the time when I would have a bit more added to my "pay" to claim her who was more to me than anything else in the world. During the conversation that followed, Dunbar mentioned the tiger he had spoken of in his letter to me; and said that as he was to be married as soon as he came back from M—s, he intended giving a "beat" in honour of his fiancée for whom it would be a novel experience, and also as a final winding up of his bachelor days. "Will you come, Dare? I have asked all the ladies in the district to join, it will be a good way of introducing the future Mrs. Dunbar to the people about here." I accepted the invitation on the condition that I was not too busy just then, which seemed hardly likely, considering the busy time I was already having. "Don't you do much shooting yourself, Dare?" asked my companion after a short silence. "No! I can't say that I do," I replied, "I have occasionally gone after black-buck, but it is not much in my line you know, besides a medical man hasn't much time at his disposal for shooting. Just take the present time for instance. Why, I hardly have time to sit down to my meals without being called away in the middle of them to attend to some fresh case of fever or cholera," and then I told them of the tiger that had come the night before and which took the dog from the servants' lines; when suddenly he startled, and cautiously whispered, "What's that Dare, there—something among those shrubs," pointing to some in the garden; "there man, can't you see it?" "Where—where?" I exclaimed, but Dunbar had risen and went into his room, the door of which opened out on to the verandah. Presently he came out with the rifle he had brought with him in his hand, and coming to my side asked if I minded him having the first shot, to which I said "no," though

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Don't despair, even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

I was puzzled to know what it was for, but was not kept long in the dark as to what it was all about and his mysterious proceedings, for a bang, a war, and then something falling heavily in the garden, soon told me that it was a tiger that Dunbar's keen eyes had spotted in the garden. We called for a lantern, and went down to where we heard the animal fall, and there lay a magnificent tiger, dead as a hammer with a leaden pill in his heart. I congratulated Dunbar on his luck, and we both concluded that it must have been the same brute that had walked away with the dog on the previous night. We had the tiger removed from the garden into the verandah, and as we looked at the dead King of the Jungle, Dunbar remarked, "I did not think of bagging a trophy like this to-day, though I always take my rifle about with me; any way I am deuced lucky!" he went down as he finished speaking, and examined the tiger's claws, and then exclaimed as he displayed the large white teeth of the dead animal, "Gad! I would not care to have those in me," and certainly those gleaming bits of ivory would not be at all pleasant things to have in one. "Well, if you get the other one that you are going to beat for too, you will be in luck's way" I said, "but the whole of last night I was dreaming of you and myself being torn to pieces by tigers, and felt quite nervous when I got up this morning. Any way you've turned the tables by bagging stripes yourself, and so I hope that it proves the fallacy of dreams;" he laughed and said dreams generally turned out the reverse, but at the same time he certainly would not care for the experience of being munched up by a tiger.

The next morning saw the departure of Dunbar and his trophy, the former to continue his journey, and the latter to the nearest taxidermists. The days that followed Dunbar's departure were busy ones for me. The fever was doing deadly work all around me, and I was out all day, and was very often called for at nights too. A week had passed, and I heard that Dunbar and Miss Farrel had arrived, and I was fully determined to attend his wedding by hook or by crook. The wedding had been fixed for the Wednesday of the following week, and I was invited to stay the night of the Tuesday (the day of the shikar, and the last of Dunbar's celibacy) at his bungalow. When Tuesday arrived, I was unable to get away till late in the afternoon, and arrived at my destination when it was quite dark; but late as it was, not one of the shikar party had returned for the dinner that Dunbar was going to give that night to his bachelor friends as a farewell to his life in single harness. So sitting in one of the many long sleeved chairs that were in the verandah, I began to smoke, and fell to imagining what my feelings would probably be on the eve of my wedding day, when my reveries were shattered by the sound of a horse galloping furiously up the road leading to the bungalow; the sounds grew nearer, and presently horse and rider were visible coming up the road, and in a few seconds were at the foot of the verandah steps, and a voice, which I instantly recognised, called out "Boy, boy, is the doctor Sahib here?" It was Hazzle, a young planter living on the "tote" next to Dunbar's, some four miles away. "What's the matter?" I exclaimed as I came to the head of the steps. "Is it you, Dare?" For God's sake, man, get your horse and come with me to my bungalow, Dunbar has been badly mauled by a tiger, and we could get him no further than my place; but the worst of it all is we can't get Miss Farrel away from him, she seems quite determined to stay with him, but here's your nag—come! let's be off. I was quickly in my saddle, and we were galloping as fast as our nags could lay hoofs to the ground towards Hazzle's bungalow; and as we went along, he told me as well as the great pace at which we were going would allow him, of all the events relating to the accident. It appears that after having placed the ladies of the party in a safe position the men—about fifteen of them—had stationed themselves round the jungle which the tiger was believed to be in; and then after a lot of felling and beating of tom-toms on the part of the "beaters," and the barking of dogs, the tiger must have got confused, by such an unusual hub-bub, and made a rush out close to where Dunbar was standing; he fired, but somehow only wounded the animal. Every one marvelled—for he was such a sure shot; any way the tiger maddened with pain, made a rush at him; he fired again, but not before the infuriated brute was on him, crunching Dunbar's arm between its powerful jaws. The shots had attracted the rest of the party to the spot, and a well-directed bullet from one of them put an end to the animal; but Dunbar was rendered quite insensible, for besides his com-

pletely mutilated arm, there was a severe wound on his head. By this time we had reached the bungalow, and throwing our reins to the "syces" who came running up as we arrived, we went in. There were several ladies there, and nearly all the men who had joined in the "beat," but beyond just glancing at them all, I took no further notice of them but asked to be shown Dunbar's room at once. His shooting clothes were still on him, except for the right sleeve of his coat which had been cut away, and his head had been roughly bandaged up, and I could see by the light of the lamp how bad he looked. But the sight of the slim girlish figure, kneeling by her unconscious lover's side—with oh! such a yearning expression on her face, made my heart give a throb of pain! It was, as I guessed at once, Miss Farrel. She turned her head when I entered, and on seeing me, and guessing I was the doctor, she rose to her feet and came to my side. "You are Dr. Dare, I think?" she said in a wonderfully sweet voice. I nodded. "Then for Mercy's sake bring him round! they say he is dying, but I don't believe it. Oh! my Love! my Love, you shall not die" and she turned once more to the wounded man's bed, sobbing wildly, and I could see the agony of her soul was awful. But I had my duty to perform, and gently but firmly took her out of the room, while I examined and attended to Dunbar. His arm was so dreadfully torn and crushed as to require immediate amputation, and the wound on his head was very severe; in fact, I knew from my first look at him that poor Dunbar had shot his bolt, and that he would not live through the night; and it was my painful duty to have to break the awful truth to his poor little sweetheart. After doing all I could for Dunbar, I braced myself up for the trying ordeal and went in search of her. I found her sitting in the verandah with some of the other ladies; on seeing me, she got up and came forward, and eagerly asked how Dunbar was, and what I thought of his condition; but as I hesitated in giving my answer, she must have guessed the truth, for with a wild light in her beautiful eyes, and with a despairing cry of "Oh! he must not die! Dick, you shall live!" she rushed past me before I could stop her, and was in her lover's room. I went after her to see she did not disturb him, but I need not have been afraid, for she was as quiet as the unconscious man by whose side she knelt. Nothing would induce her to leave him, and after one or vain efforts on my part to do so, I let her remain with her lover. And as I watched those two, the fair girl, whose very soul was racked with pain and longing for him she loved, and then the strong handsome young fellow, who was fast drifting away into that imperious existence beyond the grave, I felt a choking sensation in my throat, and my eyes grew suspiciously dim; for though I had experienced many a painful scene during my medical career, this was the saddest case I could remember; for not only did I feel for the pain of the sweet girl who had gone through long years of waiting for her lover, but also for him, he was such a favorite, his good will and generosity were known far and wide, he had life's fairest prospects before him, and to be thus cut off in the flower of his manhood and on the eve of his wedding day, seemed dreadfully sad.

During the small hours of the morning, I made one more effort to get Miss Farrel away, but she only shook her head and murmured in a strange far away voice, "No! it will be for the last time, please let me stay." Dunbar's breathing had been growing fainter and fainter. I tried to force some stimulant down his throat once, but his clenched teeth made the attempt futile, and I knew ere morning dawned he would have run his earthly race. As I sat watching I began to think of those strange dreams I had had the night before Dunbar shot the tiger at my place and sadly mused on his laughing answer when I had told him of them. I was just about to adjust the bandage round his head a little better, for it had slipped, when I saw Miss Farrel's head fall forward on to the hand of the un-mutilated arm of her lover—she had been clasping it in her own up to now—but thinking her asleep, I did not disturb her. Just then Dunbar sighed, and a convulsive shiver passed over his frame; it was the end; in a few minutes he sighed again, and as the first streak of dawn entered the room, his spirit took its flight to that land "where the wicked cease from troubling and where the weary are at rest." I went to Miss Farrel's side to awake and get her away; I put my hand on hers, it was icy cold; she would never awake again in this world, for she had joined her lover on the "eternal shore,"—Death indeed was his Bride.

"DEMON."

THE MADRAS EQUITABLE ASSURANCE SOCIETY.

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George.

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ...Rs. 3,00,000

BOARD OF DIRECTORS.

C. E. P. VANSAGNEW, Esq., (Arbuthnot & Co.),
Chairman.

G. LOXDALE MURRAY, Esq., (Murray & Co., Ltd.)

ROBT. J. BLACK, Esq., (Best & Co.)

SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)

W. GORDON, Esq., (Mercantile Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.

Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.

Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.

Agency in London for receipt of premium^{and} — for payment of death claims.^{or}

On Policies transferred to the London Register, death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Drafts on Madras.

The Society's Funds invested in India Government Securities only.

Directors must be residents at Madras.

Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.

General Meetings held Annually—not later than the end of March, in every year.

Auditor elected by Members. Accounts audited Annually.

Valuation of Society's affairs must be made quinquennially.

The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years, Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to only Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.

Term Policies issued at moderate, non-participating Rates.

The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.

For Prospectuses, forms of proposals, &c., apply to

ROUND THE BUNGALOW.

NOTES BY A PLANTER'S WIFE.

Hot cross buns.

Easter is now very near, so I give two recipes for hot cross buns which will be found very good. Take 1 qt. milk, 12 oz. butter, 12 oz. sugar, $\frac{1}{2}$ oz. mixed spice, 2 eggs, 2 oz. German, or $\frac{1}{2}$ teacupful of good thick small beer yeast and 4 lbs. of flour. If to be made with currants, add 1 or $1\frac{1}{2}$ lbs. of currants, clean washed, picked and dried. Make the milk blood-warm; if the weather is cold, rather warmer. Put it into a gallon pan, with half the sugar, 6 oz. of flour, the yeast, and eggs; mix together, cover the pan, and put into a warm place. When this has risen with a high frothy head, and again fallen and become nearly flat, it is ready for the remaining portion of the ingredients to be mixed with it; but while rising, the butter should be rubbed in with the flour between the hands until reduced to small crumbs. Mix the whole together into a nice mellow dough. If the flour is not very good and strong, about 4 to 6 oz. more may be required to make the dough of the right consistence. Cover the pan; let it remain in a warm place for about half an hour, or until the dough has risen 4 inches. Make into buns by moulding the dough up into small balls lightly under the hands, and place on warm tins, slightly rubbed over with butter, about 2 inches apart. Half prove, and cross; brush the tops over with milk, and finish proving; bake in a hot oven; when done, brush the tops over again with milk. The best method for proving is to put the tins on shelves in a warm cupboard near the fire. Place a pan with hot water at the bottom, but put no tin on the pan. Put a piece of heated iron or brick into the water in the pan occasionally to cause a steam to ascend, which will keep the surface of the buns moist, when they will expand, or prove, to their full size; otherwise the surface will be hardened and prevent expansion. Keep the cupboard door close shut until ready to bake.

Another recipe for the same.

Take one quart of milk and water about 90 deg. Fahr., add 12 oz. of sugar, 2 eggs, 1 lb. of flour, 2 oz. German yeast; mix these well together and let it stand for two hours, and then rub 10 oz. of butter into 4 lbs. of flour, add 2 lbs. of mixed fruit, 1 oz. of spice, $\frac{1}{2}$ teaspoonful of essence of lemon; mix it all well together; let it lay in a warm place for from an hour to an hour and a half; tin and prove, and well bake in a hot oven.

It sometimes happens that one has two or three buns left over, and they become stale, when they may be utilized in making the following nice pudding:

Cut them up into slices and butter them; then arrange them lightly in a buttered mould; fill up the mould with a cold custard flavoured with essence of mixed spice and sweetened to taste; let it stand for 10 minutes to thoroughly soak before putting it on to boil; boil for 1 hour or steam for $1\frac{1}{2}$ hours. Serve with spice sauce.

Spice sauce.

Into some sweetened melted butter stir in some sifted ginger and a teaspoonful each of bruised, but not powdered, allspice and beaten cinnamon; if preferred, a few drops of essence of allspice and cinnamon may be used.

POISONED FROM HEAD TO FOOT.

WE call particular attention to the subjoined statement. No incident of its kind, of equal interest and importance, has occurred of late years. A declaration so startling in its general scope, and so full of corroborative detail, certainly warrants the conclusion that a new epoch in the healing art has dawned upon us. Aside from the force of the legal form which it assumes, the facts, as alleged, rest upon the results of a thorough and careful investigation.

(Copy.)

I, George Lack, of 123, Stamford Street, Waterloo Road, London, do solemnly and sincerely declare as follows:—

"I was always a strong, healthy man up to April, 1876. At this time, whilst engaged at the Stamford Street Embroidery Works, cleaning out a tank which had been used for dyeing purposes, I slipped and fell in the tank (which was covered with verdigris),

cutting both my elbows. The parts soon became swollen, and in a week's time the flesh was putrid, as if gangrene had set in. My system seemed to be poisoned, and I began to lose strength rapidly, for my appetite left me and I could not bear the sight of food, what little I did eat lay on my chest like lead. I went to the Royal Free Hospital, Gray's Inn Road, where I was under treatment for five weeks, but I got worse. After this I got an order and went into the Lambeth Infirmary, where I was placed in No. 11 Ward. At this time my condition had become serious, for I felt so sick and faint that I could scarcely move, and, after a time, I got so bad that I could only get up for an hour or two each day. Later large abscesses formed on my shoulder, and gradually spread over my face and the upper part of my body. My face was completely covered with the abscesses, which, on healing, left deep marks, that I bear to this day. After this I had swelling around the joints, and large abscesses formed in the calf of my leg, and I had also running wounds, extending from the top of my ankle to the bottom of my feet. An offensive discharge of matter came from the parts, and it seemed as if the abscesses were drawing the life out of me. I was now in a hopeless, helpless state, and felt that I did not care how soon my end came. For days and days I never closed my eyes, and on one occasion I had but little sleep for eighteen days and nights together, the doctor's sleeping draughts having no effect upon me. When I did at length fall asleep I slept from Thursday to Sunday afternoon. From all the doctor's medicines and applications I only got temporary relief. On one occasion the doctor said that I could not live throughout the day. The nurses placed a screen round my bed, expecting that I should die during the day, and my brother was sent for. When the doctor called at night he was surprised to find me alive. However I took a turn for the better, but for months afterwards I was, as it were, on the brink of the grave. I had to be lifted in and out of bed, and was fed on slops and light food. Sometimes better, and at other times worse, I continued in this wretched state for over FIVE YEARS, during which time I remained in the hospital. In August, 1881, I became tired of being in the hospital, and was carried to my house. I was so weak and emaciated that I got a pair of crutches to help me to hobble about the house. My father and friends who saw me were shocked at my feeble and emaciated appearance, and thought I was not long for this world. I lingered on in the same wretched state for two more years, expecting and wishing that I should soon be out of my misery. In November, 1883, after suffering over seven years, my father bought me a bottle of medicine called Mother Seigel's Curative Syrup, and persuaded me to try it, saying that it had been of great benefit to him. After I had taken half the contents of a bottle, I felt brighter and in better spirits than I had been in for years. My appetite improved, and by continuing with the medicine my legs began to heal, and I got stronger and stronger. In less than three months I was able to put aside my crutches and walk with the aid of a stick. After I had taken Mother Seigel's Curative Syrup six months I was back at my work, as strong as ever I was in my life, and have since kept in the best of health. I wish the particulars of my case known to other sufferers, and the Proprietors have my consent to make what use they like of this statement. And I make this solemn declaration, conscientiously believing the same to be true. By virtue of the provisions of the Statutory Declaration Act, 1835 (Will. IV. c. 62).

“(Signed) GEORGE LACK.”

Declared at No. 16, Godliman Street, Doctor's Commons, in the City of London, this 13th day of April, 1893, before me. (Signed) George H. Brooks, a Commissioner for Oaths.

Here we have a case of profound and persuasive blood poisoning. Verdigris (chemically the bibasic acetate of copper) is, when introduced into the circulation, a slow poison, for which no positive antidote is known. There is no doubt that the physicians in the hospitals did all that could be done, with the knowledge and resources at their command. Unhappily their treatment, at best, was only mildly palliative; the poison continued its deadly work, until it saturated the poor fellow's entire system and perverted all its functions. What but an ultimately fatal result could have been reasonably expected?

Mr. Lack's final and perfect recovery, through the use of Seigel's Syrup, illustrates beyond the need of comment the unprecedented power of that well-known remedy to renew the digestion, stimulate the secretory organs, and thus to purify the blood. In common with all who shall read the details of this case, we most keenly regret that Seigel's Syrup was not taken immediately after the results of the accident first appeared.

MARKET SUPPLEMENT.

SATURDAY, APRIL 3, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (March 12, 1897) says:—The supplies brought forward in auction this week have been on a large scale and a slow demand prevailing, the Market generally is decidedly easier.

The highest point in East India however was touched last Friday when several favourite Home Trade marks realized extreme rates, but this week prices show a decline of 2/- to 3/-.

Central American kinds were offered in large quantities and meeting poor competition values gave way a further 2/- to 3/-, Costa Rica especially showing a sharp fall.

Heavy receipts and cheap cost and freight offers caused a further decline of 2/- in Futures, this being the lowest point reached for years; but at the close the market shows a recovery of 6d. to 1/- from the bottom.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending March 10th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3d. Brazil Exchange 7½d. Rupee paper 3½% 62½. Silver 29½d per oz.

The market continues freely supplied, and holders being anxious to realize, prices at the close are again rather lower, the decline since our last being about 1s to 2s for most kinds, except finest which continue to sell very well. The quality of the new East India crop is decidedly good, and fine Home-trade marks are eagerly competed for. Brazil markets are weak, and prices are materially lower.

According to Messrs. Duaring & Zoon the European stocks on the 1st inst. shewed an increase of 10,350 tons, and the visible supply a decrease of 770 tons, the figures being 117,050 tons and 234,310 tons respectively, against 106,700 tons and 235,080 tons on the 1st February, 1897.

Daily receipts have averaged 9,666 bags in Rio, and 11,500 bags in Santos.

Futures, owing to the continuance of large receipts, have further receded, and close weak at a decline of 2s 9d to 3s, viz.:—Good average Santos in Havre, March delivery closes at fcs. 56½, in Hamburg pf. 46½, and No. 7 low ordinary Rio in New York \$8.65.

To-day's London official quotations are:—

	March	May	Sept.	Dec.
Rio	44/6	44/9	45/-	45/3
SANTOS	45/3	45/3	46/3	46/6

38,311 pkgs. INDIAN	Total 63,441 packages were offered in public auction this week.		
24,331 „ CEYLON			
799 „ JAVA			

Tea statistics as given by the Tea Brokers' Association are printed below. Deliveries of British Grown Tea from the 1st June to the end of

SUPPLEMENT TO PLANTING OPINION.

February show an increase, while the stock of all Tea is very little above the corresponding date last year, in spite of increased imports.

Indian. An advance has taken place in the market, specially noticeable in Teas for price and medium descriptions. The better quality of the autumn crop has probably disappointed those who expected heavy supplies of common and medium Teas, which are now found to be much wanted. The official telegram from Calcutta gives exports to U.K. to end of Feb. as 131,000,000 lbs., against 121,000,000 lbs. to same date last season. It also states that this Season's crop is 148,217,416 lbs.

Week's av. Tea sold on Garden Account, 1897, 27,589 pks., av. 9½d.
1896, 17,105 pks., av. 8½d. 1895, 17,018 pks., av. 10d.

PEKOE.	(Blackish greyish, some tip, inferior liquor)	6½d	5½d	7½d	6½d

Ceylon. Last week's advance was generally maintained, especially in Teas for price and in medium grades of whole leaf Tea. Broken Pekoes, although showing some advance, sold irregularly and were not so keenly competed for as whole leaf grades. The official wire from Ceylon gives shipments for Feb. as 6,500,000 lbs., against 8,000,000 lbs. last year, and estimates the quantity available for Mar. as 8 to 8½ million lbs. Av. for wk. rather over 8½d. agst. 8d. for same period last year.

Comparative prices of Ceylon Tea in London:—

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, APRIL 17, 1897.

[No. 8.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 17th April 1897.

Central Travancore.

Rate 1-79, from January 1st to date 7-21. *Crops.*—Tea flushing good. March yield considerably above that of same month last year. *General Health.*—Fair. *Labour.*—Still a little short everywhere, and the difficulty in getting coolies appears to be increasing.

North Wynaad.

MANANTODDY, Weather.—Since last report calm, still, dusty nights and misty mornings have been the rule, and there has been a prevalence of pleasant sea-breezes which were frequently very strong of an afternoon. An occasional light breeze in the early morning from the eastward served to keep the land-wind in remembrance only. On 21st March there was a slight drizzle, and on 28th a slight shower, with more or less of cloudy weather during the interval. On 1st April a few drops of rain fell and since then clouds would sometimes work up from the eastward, promising rain, but

affording only an electrical display. *Plant diseases.*—None, spike and small berries are suffering a little for lack of rain in the hot, dry parts of coffee. *General Health.*—Feverish. *Labour and Grain.*—Plentiful. *General Remarks.*—The Forest Department has kindly disafforested some blocks of bamboo, lantana and grazing land, with the view of tempting planters to take it up, but another much smaller bit of reserve jungle which was wanted by us, and that would do excellently well for coffee, is not to be thrown open.

Coorg.

POLLIBETTA, 13th April.—*Weather.*—Beyond a sprinkling of rain on the 1st instant, not sufficient to measure, which has brought out a very partial blossom, there have hardly been any signs of rain except thunder and lightning in one direction or another, and the sun is very hot and the east wind has been very severe at times. This morning it is quite misty. *Crops.*—The first set has been good, but rain is badly needed to swell the berries. The blossom mentioned above is small, but looks healthy and is likely to set well. Trees have been making a good lot of spike after the first blossom, but if the rain keeps off in this way there is danger of burning. *Plant diseases.*—The number of borer trees has noticeably been augmented, but even so borer does not threaten to be severe. Otherwise coffee is looking well. *Labour.*—Sufficient for all requirements. *General Health.*—Fair on the whole. Some fever about, and cases of imported small-pox have occurred. *Interesting Items.*—There was a well-attended Inspection of Volunteers at Mercara on the 5th. The Camp and Race weeks came to a close on the 10th instant.

S. E. Wynaad.

PUNDALUR, 13th April.—*Weather.*—On the 2nd night we had very heavy showers of rain which lasted for about one and a half hours. Since that during the day it is very hot and at nights very cool. *Interesting Items.*—After Mr. Atzenwiler's departure for a change to the Coast the place is very dull. *Biswoo.*—Yesterday was the New Year's day for the aborigines; in this little hamlet there are two temples near the town belonging to the goddess Tamrathunder, the guidance of the Nellyalom palace. From 5 P.M. people from all directions were massing until 10 P.M., and were expecting the Nellyalom Rancee and suite. At 11-20 P.M. the Rancee and suite arrived in a bullock coach well adorned

with bells, etc. As soon as the aborigines heard the arrival, the Badagas with Kurumbers' band went and met the suite with greatest respects; firing of guns, display of fireworks and singing of hymns announced the arrival of the party at the temple. At midnight a Brahmin priest opened the ceremonies by offering poojah. This feast will last until to-morrow. There were several coffee shops, sweet-meat and other bazaars on the premises.

Nilgiris.

KOTAGIRI, 8th April.—Weather.—Too wet. February rains brought out a show of flowers very fair at low elevations, but inappreciable higher up, since when with frequent showers the blossom has been fooling along, coming out irregularly in patches, a more general show being expected about middle of April. The rainfall for first quarter is about 10 inches, as much as we had last year to end of July.

COONOR, 15th April.—Weather—still bright. Coffee men are feverishly anxious. After some grand flushes, tea is inclined to sulk a bit. Railway getting on, slowly, very slowly indeed. A number of estates are changing hands, both coffee and tea. One or two companies are being formed to acquire the best going.

GENERAL NOTES AND ARTICLES.

We learn that the Susan Estate, Nilgiris, recently sold at public auction by Messrs. Oakes & Co., was purchased for Rs. 5,250 by Mr. Thos. Leishman.

Rubber cultivation.

The prospects of rubber planting are by no means brilliant. *Ficus elastica*, the indigenous Indian variety, is estimated to give a return of not more than Rs. 16 per acre in Assam. Ceylon planters have had a dismal experience so far with *Hevea braziliensis*. And even if the yield per acre is double or three times that obtainable from the Indian tree, there are many and long weary years of waiting before the "maiden crop" can be gathered.

Subscriptions.

We had quite a touching enquiry the other day from a would-be subscriber asking us to reduce our subscription rates to suit his pay. This we agreed to do. It has struck us that another way, and more profitable to both parties, could be arranged. Anyone who would rather read this paper than pay for it, can have his copy free, if he secures two other subscribers at the same time. See the point?

Advertisements.

Many of our readers express their huge dissatisfaction with our system of interlarding our advertisements in the reading matter. They cannot quite understand our position, nor the very small amount of choice given us, though if they were all like the correspondent who offered to pay double rates if we relegated all our advertisements to the two ends of the paper, we might meet their wishes. We are doing our best, though, to remove this stumbling block to many would-be subscribers, and in time may perch upon the lofty roof of our office and proclaim that we are altogether clean.

Light railways.

In our last issue we were made to say that the cost per mile of light

railways was £200, instead of two thousand. In connection with this subject, the following clipping from a Home paper will be found of interest:—

A light railway has been constructed under the direction of Mr. A. Percival Heywood for the Duke of Westminster from Eaton Hall to Balderton Station, on the Great Western Railway system, a distance of three miles. Several branches, however, including one $\frac{3}{4}$ mile long to the estate works near Pulford, bring the total length of railway up to $4\frac{1}{2}$ miles. The line, while primarily intended for conveying coal, building material, &c., about 5,000 tons yearly, also equipped for passenger traffic, and as the line passes through the park and across the main avenues, it was built so as not to be in any way conspicuous. The details of design are interesting, though the capacity and the narrow gauge do not fully meet the requirements of such railways as are anticipated in the Act passed this year, yet it is wonderful how much can be carried on a 15 ft. gauge. It has low cost to commend it. The earthworks involve an expenditure of £205 per mile, and the entire cost of construction has been £1,095 per mile, excluding special storage sheds. In this are included some contributions to the beautifying of the line.

Fruit transit.

The latest American discovery which is expected to supersede refrigeration, is the packing of fruit into air-tight compartments charged with carbonic acid gas. An experimental shipment from Sacramento to New Orleans was recently made. The sides of the car were packed in pressed and dried tule (*Scirpus lacustris*), a local swamp rush, which proved entirely air-tight. The substitution of this Californian material for cork, charcoal, and mineral wool lessens the weight of each car from 4,000 to 2,000 lbs., results in the saving of 145 dollars for ice demanded in the case of the ordinary refrigerator cars. After the fruit is loaded the air in the car is exhausted, and the car is then charged with the carbonic acid gas. The fruit arrived in first class order, and obtained top rates in the market. Those interested in the new experiment were delighted with the success of this initial trip, and assert confidently that it settles beyond a doubt the utility and value of their process of preservation as compared with the refrigeration.

Burnt bones.

Bone meal is by no means cheap, so any device to reduce the cost of this valuable fertilizer is well worth noting. It is generally known that practically as valuable a meal can be made by simply burning the fresh bones as have them ground by the manure firms, the 1 to 2 per cent of nitrogen alone being lost. And at about a third of the cost.

The easiest means of procuring the earthy salts of bone (says Dr. Ure) consists in burning them to whiteness; the earthy residuum procured in this manner contains substances which did not exist beforehand in bones, which did not form part of their earthy salts; as, for example, sulphate of soda, produced at the expense of sulphur of the bones and the alkaline carbonate proceeding from the cartilage with which it was combined. On the other hand, the greater part of the lime has lost its carbonic acid. The phosphate of lime contained in the salts is a sub-phosphate consisting, according to Berzelius, of three prime equivalents of the acid and eight of base. Bone manure is more especially recommended in England for light, sandy, or gravelly soils, which disposition would certainly apply to most plantation soils.

EXPERIMENTS WITH NITRAGIN.

So much attention has recently been directed to nitragin that some notes on the first experiments in England will doubtless be read with interest.

These have been conducted by Professor Somerville at the Durham College of Science. Great care has apparently been taken in the treatment of the nitragin, and also that in the cultivation no inoculation should take place from those plots treated to the uninoculated ones.

The results of the experiments are certainly not encouraging. The plots, however, were very small, and we may hope that the more extended trials under the direction of the R. A. S. E. will show up more favourably for the "bacteria."

Peas, broad beans, lucerne and red clover were the crops selected for the experiment. In the case of the peas, the inoculated plot gained, in total produce, to the extent of 6.6 per cent. The remaining three crops yielded less on the inoculated plots than on the uninoculated. The difference in the case of the peas is not outside the limit of error that may occur in any field experiment.

Dr. Somerville states: "These experiments were carried out in a garden attached to the college, in which it may be assumed that peas and beans have frequently been cultivated during recent years. As the soil will thus be well supplied with the bacteria that associate with the roots of these plants, it is not surprising that the application of a pure culture of these bacteria should have been inoperative. But as regards red clover and lucerne, it may safely be assumed that neither of these plants has ever been cultivated in the garden, and the probability is that not a single plant of lucerne ever grew in the garden, or indeed in any fields in the neighbourhood. The conditions, therefore, were to be regarded as distinctly favourable for exhibiting the action of the specific bacteria of these plants, and yet they failed to produce any effect."

Dr. Somerville's experiments have so far been corroborated by the Continental ones.

The commercial form of nitragin is prepared by a firm at Höchst am Main, and sufficient to dress an acre can be obtained for the sum of 4s. 6d. It is of a gelatinous nature and is dissolved in water, which is applied to the feed of the crop, or mixed with dry soil which is scattered over the field. The nitragin should be kept in the dark, and should be liquefied at a temperature below 100° F.

PALMS FOR ESTATES.

TAKEN *en bloc*, the planting community is morbidly alive to the necessity of having more than one string to its planting bow. Individually, it is extremely difficult to find anyone who will devote the slightest time or trouble to solving the question. Which is perfectly natural, and only emphasises our old contention that the crying need of S. Indian planters at least is a series of commercially-managed experimental estates—estates, mind, not gardens.

The title for this paper is "Palms for Estates." There are many which might be introduced in suitable localities with a most gratifying amount of success. First of all perhaps comes the Date Palm, *Phoenix dactylifera*, but our Indian varieties are by no means the best. A writer in the *Indian*

Planters' Gazette, in some interesting remarks on the subject, states that South American seed (say from Rio Janeiro, Pernambuco, etc.) would be far preferable. Sometimes as many as 3,000 fruits are obtainable from one bunch.

As a general rule the date palm lasts for twenty years, commencing to yield in the fourth, if grown for the fruit alone and not tapped; though responding to cultivation and generous manuring it will flourish pretty well if left to itself, merely guarded from cattle and goats by the usual bamboo fascine, until the crown is high enough to be beyond the reach of these animals. The date palm is not likely to thrive, or, rather, mature its fruit, within the influence of the rain belt so that the drier localities only should be selected for its propagation.

The areca palm, commonly called the betel nut tree, is too well known to need any detailed description, and is so familiar that its gracefulness excites but little admiration except among new-comers. This palm affords such slight shade that in coffee it would, for this purpose, be quite useless. On the other hand, it would be planted up on low country tea gardens with perfect safety.

The seed should be obtained, if possible, from trees growing in a limestone formation, as these are free from the canker worm that attacks trees elsewhere.

An acre would contain in round numbers 1,600 plants, the usual income from which is reckoned at 4 annas each, so that the areca is worth attention from a commercial standpoint. The fibrous envelope can be removed by passing the fruit, after being well dried in the sun, between wooden rollers studded with nails, after the pattern of the country cotton gins. If estate owners who care to take up palm cultivation on an extensive scale will go to the expense of importing economic palms from other countries, there are many, the cultivation of which would pay handsomely. The sago, which is abundant in the jungles, is hardly worth attention, for no part of India can compete with the West Indies in this and similar starches, high as is the price of labour there. *Elais guineensis* and *E. melanacca* furnish the celebrated African palm oil, the ripe fruit being crushed and boiled, the oil skimmed and strained.

These are only a few of the varieties that may be cultivated for profit on plantations, but our enumeration, slight though it be, is sufficient to impress on owners the possibilities.

THE RISE IN COCOA.

THE position of this article, which caused great discouragement to producers up to the end of 1896, has since much improved, and, without saying how long it may continue to be so, the tendency of prices of late has been strongly upwards. From the lowest point in November last to the present date the advance in Mincing-lane quotations has been about 6s. to 10s. per cwt., chiefly on the common and middling qualities of Jamaica, Grenada, Trinidad, other British West India, African, and San Domingo. Excepting those of Ceylon and Caracas, few or none of the finest growths now show any improvement in value, and cocoa between 54s. and 64s. remains at nearly the old level of depression. Before the recent rise took place, cocoa was cheaper than it had been for five-and-twenty years previously, and though it may not become still dearer in a hurry, it is the generally received opinion that it can hardly undergo the severe depreciation it did in the past year. Descriptions which were next to unsaleable at from 35s. to 45s. per cwt. are now worth

41s. to 52s., and low defective grades that were disposable only at 25s. to 32s. have recently fetched 36s. to 42s.

The advancing market which has been witnessed this year so far is mainly accounted for by the constantly active demand for exportation to Germany, where the consumption has increased by 50 per cent. within the last year or two. The Germans prefer cocoa to coffee, esteeming the former to be the more nutritious article for their use; and, as the commoner qualities have been best suited to their requirements, anything below a certain figure has been sure of finding a ready sale. Our export trade in cocoa with Germany has therefore been materially enlarged, and, though no detailed official statistics are published, it may be calculated that the amount of cocoa shipped from the United Kingdom to that country is now twice what it was in 1896. The deliveries at the port of London help to prove this statement, for whilst they present the quantity sent to all places abroad during the past nine weeks as near 18,000 bags, the total for a similar period of the preceding year was only a little over 11,000 bags. The consumption here has also progressed at a faster rate than was the case in 1896, the actual clearances out of bond having embraced 32,200 bags, as contrasted with 27,800 bags up to the beginning of March last. The increase of 4,400 bags here shown in so short a time is in great measure due to the larger number of minor manufacturers of cocoa who have sprung up in recent years, the satisfying of whose wants, in the aggregate, has caused a clear addition to the ordinary inquiry that prevailed and was provided for years ago.

It likewise happens that the leading manufacturers of cocoa, who sometimes hold sufficient to serve them for a twelvemonth, have latterly allowed their stocks to run out beyond a safe and proper limit, assuming that the cheapness of the article would be further prolonged, and as they enter the market to replenish their reserves, the competition among the home trade and exporters is stimulated to an unwonted degree, in comparison with what it was in quieter times. By this means a fresh impetus has been given to the upward move in prices, and being based upon sound and legitimate grounds, without the questionable aid of speculators, it is the more likely to be maintained. Another favourable feature for holders is that the landings of cocoa in London since the opening of 1897 have been lighter than in 1896, comprising no more than 48,300 bags, in lieu of 50,600 bags; while the stock in the bonded warehouses, instead of being excessive, as hitherto, is 14,800 bags less than that in the former year; and as no extensive arrivals of Ariba cocoa from Gnayaquil are looked for until July or August next, it is reasonable to suppose that the market will be in a healthy condition during greater part of the season.

CASUAL JOTTINGS.

THINGS seem very dull just now down our way, and all ways. If I were rude enough, I would include your own little "rag". But I'm not. It pained me to see that you passed over without comment the proceedings of the numerous P. A. meetings in your last issue. There was a great deal printed, and a little to read. One point in particular that interested me was the para. in the Wynaad Proceedings about the proper wording of a contract. Some may have forgotten. It was to the effect that the advance should be *recovered by the master* out of wages and *not repaid by the servant*. Otherwise your only remedy is in a Civil Court.

Talking of contracts, and their proper legal wording, I was rather amused the other day. An old planter showed

me his form, which was drawn up in a way that would have made the rawest Tahsildar set the argument, if violated, aside. But the point was that it was *not* violated, and that my friend had not lost a single cowrie from absconding maistries all his planting career.

Another thing too, worthy of comment, even from me, was the proposal at the Coorg P. A. to hold extraordinary meetings for the discussion of the various modes of cultivation. A grand idea, especially if they print the reports.

A backward lead was given by the North Mysore men. Crops being small, the proposed Coffee Association scheme was "sat upon." Quite in the near-sighted planter's style. Prices are high, but there is no reason why they should not be a great deal higher, if we can only induce a freer consumption. Let us hope their logic will improve in good time. Who wants to spend any large sum in promoting the scheme? Push, energy and again push will see the thing through. Every coffee-planter resident in the old country would be an active and willing agent in the great propaganda.

In not a few places there seems to be a great dislike to the idea of individual membership of the U. P. A. I suppose the backbone of the opposition consists in the fear that you cannot get anything done if too many have a finger in the pie. A very sound idea too. But not applicable to the present case at all. Let every planter in South India join and attend the meeting. Let him vote too. Not for details but for measures and for men. Especially the last. After a good free open discussion, in which every single member will have enjoyed his part in the wordy Donnybrook, let a large and representative council of management be chosen for the year. Let it be large to prevent needless heart-burning. While for actual work, let this same council appoint a small committee, who will manage things in very much the same workmanlike manner as they now do. Only with one great difference, that they will always have the thorough confidence of the whole community which they represent. At present, serious jars will probably happen, disagreements which are absolutely impossible to avoid under the present *regimé*.

I came across a copy of the last Annual Proceedings of the Madras Agricultural Society the other day. What earthly use does this Society do to anyone but amateur gardeners? Agri-Horticulture! Be downright, dear M. A. H. S., and call yourself a vegetable and flower-growing association. Its bright example seems to be followed by a similar society lately started on your own Hills, the Nilgiris. Flowers are very nice things to look at, and vegetables are decidedly good to eat. But does it require a Society to grow either?

By the way, why, oh why, Mr. Editor, did you lose your hair so badly with Ceylon, its editors, its planters and its climate? Some of the best and cleverest planters I know hail from Ceylon, and are doing great things in tea at least. Coffee, also, one of them appears to have got a thorough grip of. Rather an open secret, but I suppose everyone knows that the man who is making all our coffee fossils gasp with his new ideas of cultivation is a Ceylon man.

EAL SUOK.

THEORIES BY A NEW HAND.

HUMOUR YOUR COOLY.

Yes, here I am again, and not afraid of tackling perhaps the biggest question that ever troubled owners, managers and superintendents, which reflects less on my pluck than on my head. This is after the manner of New Hands, so it is no use making rough remarks, so as long as you, Mr. Editor, don't smother this in your W. P. B., I'm happy, as also should be my readers, if they have the faintest traces of good taste in them. But I have forgotten my cooly, and how I am to coerce him.

The first thing is to catch him, but I am not writing of the hunting of the snark,—merely how to charm him. Like coercing stubborn horses, there is the rough way and the gentle way. The first has pretty well died out, and a good thing it has, though the latter alone is of no earthly use. A good strong arm adds appreciably to the sweetness of the Doray's smile, when he is enforcing orders which strike the ordered as verging on the unkind. The arm, with a fist or stick at the end of it, need never be used, but the knowledge that it is there, *if needed*, helps Chinna-sawmy to make believe that he almost likes his work. Being a new, not to say young, hand, my feelings towards Chinna-sawmy are very paternal. Somehow the air in a plantation develops the paternal instincts very fast in more ways than one. My great wish has been to train the feelings of this angular, thin-limbed Tamil so as to make him believe that our interests are identical. It may seem Utopian, but in a few cases I almost imagine I have succeeded. First of all, I try and get at the cooly and not his boss, the maistry; this, for various reasons. The most obvious is the one that is embodied in the breaking of the bundle of sticks. If you row a maistry, you are practically rowing the whole bundle, *i.e.*, all his gang, and in a lump the bundle is sometimes difficult to handle. Take him individually, the cooly is accessible to reason, also to other arguments. For the sake of comparison, suppose I put the force, moral and physical, of the planter at 10 H. P. (nominal) and that of the cooly at 1 H. P. (efficient). The odds are ten to one. But if you set your 10 H. P. against even a 25 cooly gang maistry, one cannot always be certain of the result. The maistry, in a manner, funks his coolies just as much as you do; so if you take them one by one and "charm" or otherwise coerce them, it helps him a lot.

I see I have again brought in the word "charm." What charms the average cooly? Many things, but all are not good for him. Easy work will send him to an early grave. Wherefore your paternal instinct must come into play: choose his diet. To do Chinna-sawmy justice, he isn't a bit afraid of hard work, if he can only be got to understand that it will pay him to work hard. As a rule it doesn't. For if he is one of a working gang, his hard work merely relieves his lazier fellow-workers of a portion of their task, so they all try and laze together. A cooly's "kanah" is supposed to be an average day's work for an average man. As a matter of fact it is based almost invariably on the working powers of the (all but) weakest man in the gang. Consequently a very large percentage of the gang can do a great deal more than their kanah. But it is of very little use trying to enforce a bigger task than the usual one.

You must set about it in a different manner. A very simple one too, though it needs careful looking after. Just allow the best and quickest workers, when they have finished their daily kanah properly, to do more work (on contract) on a neighbouring *tundu*. Naturally the simpler this work, the better. The best men will take to this method with great gusto, and do their level best to finish off in time to do another quarter kanah as extra, or "shantosem," work. The first objection to this is that the coolies will simply shirk their day's task in order to get extra pay for their contract work. So they will at first. But you have a powerful hold over them now and can easily check this. Simply forbid the shirkers to do anything more than their ordinary task. It is the stick and sugar-plum principle of paternal government. It is a principle, too, the logic of which the stupidest coolie understands, and moreover appreciates the justice thereof.

He sees you are trying to reward good workers, and, after a time, feels as if the "ma-bap" system, of which so much talk is made but which is so little really felt, is in truth something very comfortable to work under.

To my callow thinking, the "only a nigger" notion so often held of coolies is senselessly wrong. A cooly is a human being, and resents being treated as a dog just as much as we stiff-necked planters object to being "bossed" by Anglo-Indian officialdom. Take him—the cooly—at the lowest point. He is an animal with rudiments of gratitude, faithfulness and honour. These rudiments should be developed. That they can be developed to a surprising extent, I have no manner of doubt, though unless you take it for granted that they do possess these rudiments, all progress is impossible.

Lookers on see most of the game. We planters know the relations of the natives with the Government a vast deal better than the latter. We abuse the officials for their harsh and arrogant, not to say downright ignorant, manner of dealing with their subjects. Does it ever strike us that we too, in our way, suffer from exactly the same failing?

One thing you must remember. It's no manner of use pretending an interest in your coolies if you don't feel it. Natives of this class are as sharp as children in seeing through a sham of the sort.

Some men have the audacity to complain of the ingratitude of a native whom they have had perhaps a long time in their employ. What have they done for him, nine cases out of ten? Simply paid him the usual wages due for the work done. Perhaps a trifle extra now and then to keep him contented and to avoid the trouble of engaging a new man. What cause is here for gratitude? Surely a labourer is fully worthy of his hire. It is indeed wonderful how often, amongst the so-called lower classes, gratitude is shown in such cases. Does his master, the manager or superintendent, feel any gratitude, at the end of say twenty years' service, to the individual or firm who employs him? The converse is more often the case. He grumbles and feels very sore at the ingratitude of his employer for finally turning him off without a pension!

Few will see the logic of the above when applied to the cooly.

To win a man's gratitude you must do a little more than pay him his dues. You must interest yourself in him.

Find out his aims and ambitions: they are very few and small. To gratify them will cost nothing in money, only a slight outlay in kindness. I don't want to begin to preach (*begin?* queries one of my readers); but if there is one investment more paying than another, it is kindness. A kind deed gives the doer as jolly a feeling as a good peg, any day. And as the Englishman in India is supposed to need stimulants, it is sound business to supplement one's whisky with an occasional cock-tail of kindness. For it is decidedly cheaper.

GINGER.

BY J. CH. SAWER, F.L.S.

THIS very widely-used aromatic is furnished by the roots of the *Zingiber officinale* (Roscoe), an Indian herbaceous plant with creeping jointed, woody root-stocks, from which are sent up every year stems surrounded by sheathing leaves arranged in two ranks. Its cone-shaped spikes of flowers are thrown up from the root-stock. The plant is largely cultivated both in the East and the West Indies; also in Africa (Sierra Leone) and in Queensland (Australia). The so-called Chinese and Siamese gingers are identical, but both of them are the produce of another plant, *viz.*, the *Alpinia Galanga* (Willd.). Yet, considering the wide distribution of *Zingiber officinale*, it is quite possible that the true ginger may also be cultivated in some parts of China.

The quality and commercial value of the dried rhizome from different localities varies considerably, being influenced very much by the method of cultivation, collection, and preparation.

Ginger is largely produced in all the warm and moist parts of India, up to an elevation of 4,000 to 5,000 feet. The best pieces of the previous year's harvest are selected and sheltered in a corner of an outhouse; the heap is then covered over with cow-dung to keep the roots from drying up. The land is prepared by ploughing it up two or three times, and then dividing off into beds, with a little raised edge round each bed, care being taken to make openings to allow superfluous water to run off; for if water stands on the crop the roots will rot. Pieces of the roots one or two inches long are then buried three or four inches deep in the soil at intervals of nine inches, and the field is next covered over with the leaves of trees, which keep the soil moist; over the leaves manure is spread to a depth of half an inch; when it rains, the water, impregnated with manure, filters readily through the leaves to the roots. Artificial irrigation is not employed during the rainy season, but after that period it is necessary. During the first three months of the dry season the field is weeded three times. At the end of that time the plants will be about two feet high, having eight fibrous tubers to each shoot; these are dug out and buried in another place for a month. They are then taken up, and if intended for use as "green ginger," are simply exposed to the sun for one day. If intended for dry ginger, the fresh roots are put into a basket, which is suspended by a rope, and two men, one on each side, pull it to and fro between them by a rope attached, and thus shake the roots in the basket; this process is carried on for two hours each day for three or four days. After this these are dried in the sun for eight days, and again shaken in the basket. A two days' further drying completes the process.

In Jamaica (where the finest ginger is produced) it has been ascertained that the soil which yields the very highest quality known in the market is the deep, black soil of the virgin forest; but to grow ginger under this condition involves the destruction of large areas of forest. Magnificent trees six feet in diameter may be seen in some districts lying rotting on the ground, while the ginger cultivators have gone further to the centre of the island. The plan adopted for clearing a forest is for a cultivator to invite a few of his friends to a "cutting match"; he provides food, etc., and the laborious work of felling trees is carried on merrily, and without much expense. Afterwards fire is applied, and the place is burnt over. This burning is considered very important; probably because the resulting deposit of the mineral matters or ash returns to the soil those inorganic constituents which had been abstracted therefrom by the trees. Besides, undoubtedly, the fire also sweetens the ground, corrects sourness, and,

moreover, it destroys insect pests. Some cultivators will grow ginger only in freshly-cleared woodlands, and the next year they move on to a new clearing; but although they get in this way very fine ginger, it is at the expense of forest land. Albert Town was not so long ago a centre for the cultivation, but it seems that growers have already got as far as fourteen miles further inland. Although ginger is an exhausting crop, and growers have been advised not to plant it on the same ground two consecutive years, it can be and is grown in many places a year after on the same ground, but in this case it runs wild—or, as it is called, "ratoons." The "plant ginger" (the produce of planting) is of better quality than the ratoons, which become inferior in each succeeding year. When the ground is too poor to grow white ginger, then the inferior blue variety can be grown.

As regards the application of manure, there is a prejudice against it in the West Indies, some growers maintaining that it breeds worms and that there is a difficulty in getting it in any quantity. It is probable that those who have not succeeded with manure have used it improperly by applying it fresh or not sufficiently mixed with soil. As to obtaining it in quantity, example should be taken from the Chinese labourer, who preserves every particle of matter that can in any way be utilized as manure—not only cattle manure, but decaying matter of any kind, night-soil, etc.; even soapy water left after washing is very useful. To imitate the formation of forest soil, a pit might be filled with alternate layers of bush and manure; everything in the nature of manure or decaying matter should be thrown in, and a layer of soil directly over the manure would be useful. The pit ought to be lined with clay, to prevent the very valuable part of the liquid of the manure from escaping, and a cover of some kind should be placed over the pit to keep out rain. Such a compost, when quite decayed, would be found very useful for refertilizing the soil.

In some part of Jamaica a soil of well-drained clayey loam is selected. The method of planting out is the same as in India (above described). The small pieces of root are set in March or April. The flowers appear in September. When the stalks wither in the following January or February, it is time to dig up the roots. At this period these are fibrous and fit for drying; but if required for preserving in syrup, or candying, they should be dug up before this period, whilst they are still succulent. The mature rhizomes for drying are separately picked, washed, and scraped; they are then dried in the sun and the open air. Occasionally, owing to a very wet season the people cannot dry the ginger in the sun; it then mildews, and the badly cured ginger sometimes found in the market is more frequently the result of this cause than of want of care in curing it.

Dried ginger is called by the dealers "races" or "hands." It is in flattish, jointed, branched or lobed, palmate pieces, which rarely exceed four inches in length. The Barbadoes, Bengal, and African gingers are covered by a dry, shrivelled epidermis commonly called the "coat"; hence these sorts are usually said to be "coated" or "unscraped," whereas the Jamaica ginger and some of the sorts brought from Malabar and Bengal have been deprived of their epidermis, and are, therefore, called "uncoated" or "scraped." The external colour varies in different sorts of pale or bright yellow to dark or brown; the palest sorts is the fine Jamaica, and this realizes the highest price. Cochin ginger resembles it, but is of a pale brownish tint externally. According to some authorities, the chalky white appearance of the so-called "bleached ginger" is produced by submitting the root to the action of the fumes of burning sulphur or by washing it in a solution of chloride of lime; but it is also likely that this appearance results sometimes from a simple application of chalk or plaster of Paris.

The interior of the dried root varies like the exterior in colour; the best is that which cuts pale but bright. The consistence of ginger, as ascertained by cutting, varies from soft to hard, or, as is termed in trade, "flirty," the soft being preferred.

The Chinese ginger (above referred to as *alpinia galanga*) is cultivated in nearly all parts of the province of Kwang-tung. The districts of Nan-hai, which belongs to the city of Canton, produce greater quantities and a better quality than other neighbouring districts. The independent tribe of the Misotsu, in the mountains at the north-western border of the same province are also said to produce large quantities of ginger. In the district of Hsin-hsin about thirty miles south of the city of Chao-ching, on the Western River, three-tenths of the flat land and seven-tenths of the cultivated soil in the hills are planted with ginger. A distinction is made

between the flat land ginger (called in the Canton dialect *Ten-Keung*), which is generally soft and tender, and mountain ginger (*Shan-Keung*), which is brittle and very pungent. This is generally used for home consumption; the Chinese pickle it in vinegar. The expensive *Ten-Keung*—syrup ginger—is almost exclusively consumed by foreigners or exported.

The marked difference between the Chinese preserved ginger and that from the West Indies has been carefully investigated at Kew, with the result that they are now considered to be produce from distinct plants, as above explained.

The plant furnishing "Siamese ginger" is reared in a desultory manner in almost every village, but so little care is bestowed upon the culture and drying that it markets at a very low price in the local bazaars. The best quality is procurable from the bazaars frequented by hill tribes.

The yield of essential oil from various dry gingers ranges from 1.9 to 2.7 per cent. The oil is yellow in colour. Its odour is intensely that of the root—the oil of Jamaica root being the most fragrant—but no variety yields an oil possessing the pungent burning taste of ginger; this taste is due to *gingerol*, the active principle of the root, and exists to the extent of from 0.6 to 1.45 per cent. It can be eliminated in the form of a viscid fluid of a pale straw colour, entirely devoid of odour, and of an extremely pungent and slightly bitter taste. It is very soluble in alcohol, even when highly diluted.

The total imports of ginger into the United Kingdom during 1894 were as follow:—

	cwt.
From India, the Straits, and Ceylon ...	57,922
" British West Indies ...	6,848
" Hongkong and other British Possession ...	1,360
" Sierra Leone ...	14,933
" Various foreign countries ...	4,401
	85,464

Powdered Ginger is sometimes adulterated with rice flour, but this is readily detected by the microscope. A more serious adulterant has lately come into use, namely, the addition of from 10 to 30 per cent. of exhausted ginger, which is practically valueless. This can only be detected by a careful chemical examination. — *Planters' Gazette*.

BEE-KEEPING IN THE KHASI HILLS.

JORHAT.—The following notes are taken from "A Collection of Papers on Bee-keeping in India" which has been kindly lent me for the purpose:—

In the Khasi Hills bee-keeping is practised, writes Mr. S. E. Rita, and the honey both sold and used for domestic purposes. I may mention that I have kept bees for the past two years, and obtained over 30lbs of honey, exclusive of wax, every year. The honey is every bit as good as Narbonne honey. This was the produce of portions of two hives. At first I followed the Khasias' plan of keeping bees. Their hives consist of a small box, about 18 inches square, and the same in depth, kept near their houses under the eaves of the roof. It is a very rude fashion, as when they wish to remove any honey they have to force open the back of the box. They do not destroy or stupefy their bees when engaged in extracting honey; they merely remove them from the comb, as they break it or cut it away from the box. They cover their face only with a thin cloth, usually covering their face with the puggree they wear. As a means of keeping the bees away from their faces they generally chew a little ginger, the aroma of which is apparently not agreeable to the bees, for they appear to keep away. In case of stings, the *pan* leaf is applied to the puncture, which allays the pain almost immediately.

The Khasias do not practise artificial swarming. In fact, they do not know what it is or how it is done. They do not trouble very much about the natural swarms; if a swarm of bees settle close to their abode, they will try and get it. But natural swarming is very troublesome, as when there is a likelihood of a swarm going off a watch has to be kept, and even if one secures a swarm at times, it is very difficult to hive them, the bees not taking readily to their new home. My last experience was that the swarm was hived no

less than five times, and then I lost the swarm altogether. I have shown my new hive, which I got from home, to one or two Khasias in Shillong who keep bees, and advised them to adopt it, but they seem reluctant to do so, although they admit it has several advantages over their system.

Babu Jeebon Roy says:—There are two species of bees in these hills (the Khasi): one is locally called "Lywai" and the other "Ngap". The "Lywai" is larger than the other. It is wild and has never been domesticated. Its hives are generally in inaccessible rocky precipices. In the middle of the precipice it builds its comb, hanging it to some rock in a crevice. Sometimes it selects large and high trees in dense jungle for the purpose. The comb it prepares is flat in form and very large, often weighing more than half a maund. When the people discover the hives, and wish to collect the comb, they drive out the bees by blowing the smoke of a smouldering fire on the hive, on which the bees at once leave the hive. To gather the comb from a hive found in the precipice the joint operation of some six or seven persons is required. Of these three or four persons mount to the top of the precipice by some accessible way, leaving two or three men waiting at the base. Of the persons who have mounted to the top of the rock, one is lowered down in a sling tied on to a stout rope, which is held by the rest of his associates above, or which is secured above to a tree or rock. He is furnished with materials to light a fire for smoking out the bees and to cut the comb, also with a leather bucket tied to a rope for depositing the comb when gathered. After the operation is done, he lowers down this bucket to the men waiting at the base of the rock to receive it, as previously arranged.

The bees of the "Ngap" or the smaller species are not larger than the ordinary flies. This kind exists in the jungle also, but is the one generally domesticated by people in their compounds. The following is the process in which the bees of this species are domesticated and kept in hives. The hive is generally made of a piece of a tree trunk, about 3½ feet in circumference and three feet in length scooped hollow, with an opening at both ends about two feet in circumference. After taking the bees from the jungle, they are put in a hive, and the queen-bee is tied up by a thread or hair for some time to a stick in the hive in order that it may not fly out. When the hive is sufficiently dry the opening at its ends are closed, leaving at one end, however, two or three small holes for the egress and ingress of the bees. The hive is covered with thatching grass as a protection against wet. A year after bees have been put in the hive in the manner above described, the hive is opened and the honey inside is taken out. Subsequent to this the honey is gathered thrice in a year, once in the autumn and twice in the spring. When the rainy season ceases, the bees begin to breed. At this time the hive is cleared of the old comb, in order to enable the bees to build a new one.

The Rev. J. Roberts says:—When the natives find a nest of bees they try to catch the queen by simply searching for it with their fingers, and without having recourse to any stratagem. But if the swarm happens to be of a pugnacious nature, or if the hive is built out of reach, e.g., when it is built very high in the hollow of a large tree, they go through the process of smoking them, but not to the extent of killing them. They drop down one after another in a state of stupor. When the queen drops, it is caught and a piece of string is tied to its wings, when all the rest cluster round her, and the whole hive is taken home.

About the end of May or the beginning of June, when flowers, &c., begin to blossom, a great number of swarms come up from the valleys to the hills and remain there during the warm season; then they return to the valleys for the winter months. The natives, knowing this, make convenient holes under stones, &c., here and there. They then shut them up with earth and stones, leaving a small hole for the bees to enter. The bees when they come up very often find out these holes and enter into them and remain there. In this way a great many of the swarms that come up are caught. Some of the natives have a very sharp ear for the sound of a swarm of bees, even in the hives. In the jungle they follow the direction of the sound without fail to the spot where the swarm is. But the most common way to find a swarm in the jungle is to keep an eye on the leaves of grass and small bushes. If they find the deposit of bees on the leaves, they know that a nest is not far: for the deposits of bees are never found far from their hives. When they find a spot bespattered with the deposits of bees, they go there early in the

morning while the atmosphere is yet clear, to watch the going and coming of the bees, and in this way they never fail to find out the spot and to catch the swarm. Very often when the queen is caught her wings are plucked off to keep her from flying away. But of course this will prevent the swarm from increasing, as the queen cannot lay eggs. The natives have noticed this, but not one of them knows the reason why. When a queen, deprived of her wings, dies from some cause or another, *e.g.*, from going out and not being able to return, it is customary to take a queen from another and a weaker swarm and introduce it instead of the dead one, and if sufficient time (about 18 or 24 hours) be allowed to pass before the introduction of a new queen, the plan is always successful. The kind of hive used by the natives is a hollow piece of wood, about $2\frac{1}{2}$ feet in length and from 10 to 12 inches in diameter. It is hollowed through, and a small door put at each end, one for the bees to come and go, and the other to take out the honey when it is wanted.

It is noticed also that there are no drones among the bees when they come up to the hills in the spring, but on their return there is no lack of them.—*The Planter.*

“HOW PRESERVES ARE MADE.”

In the course of a lecture on this subject, delivered last month at the Grocers' Exhibition, Professor Goodfellow said: There can be no doubt that if it were not for methods of preservation a very vast fruit supply would be lost to the people of the world. The sale of jams and other preserves forms a very large proportion of the weekly sales of the grocer, and therefore it will be appropriate and interesting to follow their manufacture by the aid of the lantern and photographs, and to illustrate the care with which they are prepared. In time past a considerable percentage of jams were adulterated by the addition of vegetable pulp, and samples manufactured from inferior fruit were by no means uncommon. To-day, however, a vast improvement is evident in the quality and purity of preserves, and it is only on rare occasions that samples are discovered which have been adulterated. Generally, the jams of British firms are pure and carefully manufactured, and great strides have been made in their manufacturing processes, securing the retention, to a greater degree, of the natural flavour of the fresh fruit. Jam is universally looked upon as merely a stimulant to the palate, rendering certain flavourless foods more agreeable, and to aid the appetite by making bread more acceptable to the sense of taste. But this view does not indicate the full food value of jam. Jam is prepared from fresh fruit and sugar, and these substances are important items in the diet. Fruit may be regarded as consisting of water, sugar, albumen, fat, fruit acids, salts and cellulose, the water largely predominating. The sugar present is in a most assimilable condition, being ready for absorption by the blood. We may neglect for the present the small percentages of albumen and fat, but the fruit acids and cellulose are very valuable food stuffs. The chief fruit acids are malic, citric, and tartaric, and they perform important functions in the body. In the first place they are anti-scorbutic, counteracting the tendency to scurvy, and they further purify the blood by keeping urates and other waste bodies in solution, facilitating their excretion by the kidneys. A certain proportion of these acids are neutralised during the manufacturing processes, but sufficient remains to make jam a desirable food in this respect. Fruits, too, contain natural phosphates in an available form, and thus help to supply bone, teeth and brain-forming material. The cellulose in fruit forms the indigestible portion, but it must not be regarded as useless on that account. A definite proportion of indigestible matter is essential to good digestion, to give the necessary foundation bulk and to provide a safe and gentle stimulant to the bowels. Cane sugar, with which the fruit is associated in jam, is also a true food. It is converted by certain digestive juices into glucose, and in that condition is absorbed by the blood. Sugar has a most important connection with the liberation of energy in the muscles. The older view of physiologists, that lean meat and other proteids were the sole sources of muscular energy, has been largely modified, and it is now conceded that sugar and other carbo-hydrates are intimately concerned in muscular contraction. Jam, then, quite apart from its palatable qualities, is a good food, and contributes its quota to the nourishment of the body. The popular idea that jam is detrimental to the teeth and stomach is quite wrong. Sugar, the constituent to which this property has been ascribed, is not in itself harmful to the teeth. Bad teeth are generally due to a want

of cleanliness, and sugar has obtained its bad character on account of its proneness to fermentation. In the fermentation lactic and other bodies are produced which, if allowed to remain in contact with the teeth, exercise a harmful action. But if the teeth are properly cleaned no sugar will remain in contact with the teeth for a sufficient period to ferment, and therefore it cannot have any corroding effect on the enamel. In certain jams there is a tendency for the sugar to granulate, and in order to counteract this, a very small proportion of grape sugar or glucose is added to prevent this condition. Much misconception has arisen on this point among the trade and the public. There can be no objection to this addition of grape sugar if properly prepared from the starch. Inferior glucose contains a slight impurity, due to the presence of sulphates, but the jam-makers would not be likely to use it for the sufficient reason that it would spoil the flavour and reduce the value of the goods. The best varieties of glucose are practically free from sulphate. Grape sugar, or glucose, is true food, and, as a matter of fact, more assimilable than cane sugar. I do not, of course, advocate the excessive use of grape sugar for this purpose, but certainly defend the custom of the manufacturers to prevent the granulation and consequent spoiling of the jam. The complete operations in jam making may be summarised very briefly under the following heads:—(1) Preliminary preparation of fruit, (2) boiling, (3) filling and (4) finishing. The preliminary preparation of the fruit includes the picking out of damaged specimens and the removal of stalks and other extraneous matter. The prepared fruit is now ready for the boiling pans. The boiling pans are usually made of copper, the heating arrangements being a steam jacket. The purest cane sugar is employed, the proportions varying according to the kind of fruit. The mixture is boiled until done, and then poured into suitable receptacles for the next operation. In one factory the boiled jam is poured through tubes to large vessels on the floor below, from where it is taken as required for filling out. The jam is now poured into pots by hand, and the surface covered with prepared paper to prevent the formation of mould. The pans are now ready for the final operations of labelling and covering, which are deftly and neatly performed by girls. A very large proportion of the new season's fruit is not, however, manufactured immediately into jam. It is boiled in suitable jars, securely corked and sealed, and stored in suitable rooms. This “pulp” is used as required to supply the steady demand, and if properly prepared keeps good for a long period. Of late years many manufacturers have supplied jams mixed with small quantities of gelatine, which gives firmness and coherency to the mass. Many grocers prepare a large proportion of the jam they require on their own premises. The plant necessary is not large or expensive, and the grocer has the satisfaction of being fully assured of its high quality and purity. Marmalade is prepared from oranges and sugar, and differs slightly in its properties from jam. The orange is richer than the jam fruits in citric acid, and contains in addition certain flavouring bodies and essential oils in the peel. Marmalade, therefore, suits those palates which are not fond of sweet foods, and in addition acts as a tonic to the stomach. No doubt these tonic properties account for the universal custom of taking marmalade at breakfast. The first operation in the marmalade factory is sorting and cleaning the fruit. The oranges are then cut in halves by special machines and the halves pulped. In the latter operation the half orange is pressed against a dome-shaped revolving rasper, which completely and cleanly removes the inside, the juice falling into the receptacle below, while the skins are thrown into a box. The skins in the meantime are cut into fine strips and boiled in water. The object of boiling is to remove the acrid bitter bodies of the peel, which would spoil the flavour of the marmalade. The pulp and a proportion of the boiled peel are now mixed with cane sugar and boiled in steam jacket pans. The marmalade is filled out, and the jars finished in a similar manner to the jam pots. Many manufacturers now prepare a kind of marmalade free from peel, which is replaced by a little gelatine, and to those who do not care for the somewhat bitter flavour of the peel, the new varieties should prove attractive. The Christmas season will soon be upon us, when the shop windows will be attractively set out with candied peel of all kinds, and a short description of the candying process may prove interesting. The lemons are first cut in halves and the pulp pressed out without injury to the peel. The skins are then preserved in brine for about six weeks, after which they are ready for boiling. After boiling, the skins are soaked in cold water to extract the salt, and steeped in cold syrup until thoroughly impregnated with sugar. Hot syrup of a certain consistency and

temperature is then poured over the peels, which after draining and re-boiling are ready for the market. Preserved ginger is prepared from the imported variety in the following way. The ginger arrives in this country in small tubs. The pieces of ginger are first drained, and reboiled in syrup. They are finally crystallised by allowing them to stand in syrup of a certain consistency, when fine crystals of sugar soon form on the surface. When the crystallising action is complete the ginger is drained and is ready for packing. I have now briefly placed before you the main facts connected with the manufacture of preserves, and hope that the knowledge gained to-night will tend to clear away many popular errors regarding jams, and help you to appreciate the great advance which has been made during recent years in jam boiling, and the care bestowed in modern factories in the manufacture of our popular preserves.

LETTERS TO THE EDITOR.

DRY COFFEE SEED: A QUERY.

DEAR SIR,—Will you or your readers please inform me whether coffee seed which is over-dried, with the parchment cracked, is suitable for planting.

I have been advised by my planter friends not to plant it, but the planter who supplied it says he is of opinion that the seed is perfectly good.

Yours faithfully,
SUBSCRIBER.

CREAMING AND SEDIMENTATION OF TEA.

SIR.—I suppose all your readers now know to what the "creaming" of tea is due. But if a tea won't cream, can they tell me how to make it, so that it *will* cream? My tea is not a very grand class of hybrid. Elevation 6,000 feet. Rainfall 50 inches or so. Age of leaf from pruning, twelve months to three months. Wither rather under, roll hard, ferment ditto, firing slow. Tea (dool) "scums" almost at once, but not in the proper clouded or milky way for a cream. Next morning (though kept in shade) the scum is all gone, and the bottom of the cup is thick with sediment. In good creaming teas the cream takes longer to form, and lasts quite 16 hours.

Query: the best way to correct defects of too early sedimentation?

Yours,
NON-CREAMER.

JADOO FOR SUPPLIES.

DEAR SIR,—I have read "Try Jadoo's" letter, under the heading "Jadoo for Supplies", in *Planting Opinion* of 20th March. In reply, let me ask him what is the main difficulty all coffee planters experience in regard to "supplies"? If he is a coffee planter himself, he will, I feel sure, agree with me that the difficulty does not consist in raising a good plant *in the nursery*, to be put out in the field as a supply, but in inducing that same plant to come on, and develop into a healthy vigorous tree, *after it has been planted in the impoverished soil of an old estate*. Does "Try Jadoo" seriously consider that this difficulty would be surmounted by half filling the baskets in which the seedlings are raised with Jadoo? To me it seems obvious that this small quantity would have no practical effect *in the field*. In a very short time after planting out, the roots would leave the basket, and penetrate into the exhausted soil round, with precisely the same result as obtains now—a whippy weakly plant that will never make a robust tree, capable of bearing a good crop. Granting for the sake of argument that Jadoo has all the merits claimed for it (merits which in my view, and judging from the correspondence I have seen, still remain to be proved, so far as coffee is concerned), I maintain that to be of any benefit to supplies, the fibre must be applied *in bulk, after the supplies are*

put out in the field. If Jadoo can then nourish the supplies for a couple of years and induce vigorous growth, the plants may perhaps be able to fend for themselves. For such an application, the $\frac{3}{4}$ peck (not $3\frac{3}{4}$ pecks as "Try Jadoo" says), given in the prospectus as the amount for each plant, would not be one whit too much, seeing it only represents $\frac{3}{16}$ bushel. But even this quantity means an outlay of 9 annas per plant, an absolutely prohibitive price. The only real solution of the difficulty in regard to cost is the one you suggest, Mr. Editor, in the same issue of your paper, viz., that the fibre should be manufactured locally. Coir would probably do quite as well as peat moss as a basis. This is cheap, and its employment would save the heavy freight from home. There would then remain cost of chemicals, cost of manufacture, and manufacturer's profit, and the fibre could be retailed at a price which would allow planters to use it in sufficiently large quantities. In the hope that the Company, if floated, will adopt this course, I sincerely trust the capital they ask for may be subscribed.

As to the value of Jadoo Fibre in nurseries, we have the testimony of Mr. G. H. Green, of Callendar Estate, Ohiya, Ceylon, in this same issue of *Planting Opinion*. He has evidently given it a fair trial, and this is what he says: "As regards tea nurseries, I put some into old nurseries which had been replenished with good black jungle soil, with the exception of the piece containing the fibre. I found there was not much difference in the growth of the plants, any slight difference being in favour of the fibre," which opinion is surely damning Jadoo with faint praise. The next experiment, in which Jadoo brought the seedlings on "nicely" in "very bad soil", seems to show that it *would* be of benefit to supplies if applied in bulk in the field. My own experience with coffee is on all fours with Mr. Green's, viz., that Jadoo *versus* good shola soil (with a little cattle manure in my case) is an even race. Last December a planter I know germinated a lot of seed in planting baskets half filled with Jadoo. My seed was germinated at the same time in planting baskets filled with good shola soil and cattle manure. As far as I can see, there is absolutely no difference in the present appearance of our respective nurseries. I admit it is too early to judge with any degree of certainty, and I intended, if possible, to have another look at this Jadoo nursery about the beginning of June.

TODA.

IMPROVED COFFEE SEED.

I.

DEAR SIR,—In your issue of 20th March, Mr. L. W. Grey, of Pykara, tells us that while disclaiming any wish to "crack up his own pullet," his supplies, grown from "*his seed plant*," (the italics are his own,) and put out in the field in June—July 1894, are "five to six feet high and sturdy, healthy, &c." I can only exclaim "Wonderful!" As he has been good enough to afford us this information, will he put us under a further obligation, and tell us why he allows his supplies to reach a height of "five to six feet"? Is he a believer in the native system of growing coffee? Like Rosa Dartle, I "only want to know" you know.

AJAX.

II.

SIR,—With regard to Mr. Grey's seed, the seed it is stated contains 7% of ash with the parchment, but only 3.71% without. From this it is evident that almost half the percentage of ash is contained in the parchment. In reply to "Bet's" query, published in your issue of the 6th March, asking the advantage of obtaining seed possessing 7% of ash, Mr. Grey refers him to P. O. Nos. 2 and 3, pages 70 and 104. In P. O. No. 2, all I can find written in support of "Mr. Grey's extraordinary seed" is that "the increase of ash would probably" improve the germinating power of the seed

and so make a vigorous plant. Also "the potash and phosphoric acid in this ash would afford the first food for the young plant and give it the necessary start in life that it requires." These statements are made by Mr. Hooper, a chemist of some standing and a botanist of no mean order, and may therefore be accepted as undeniable. What follows necessarily hinges upon the answer to the following question: "When a seed containing a parchment, such as that of coffee, is put down in a germinating bed, does the parchment in any way assist towards contributing sustenance to the seedling?" If it does, then, as is very obvious, Mr. Grey must be congratulated on having introduced his seed into the market. Under these circumstances may he reap his well-deserved reward. But on the contrary, if the parchment does not in any way affect the growth of the coffee seedling, then of the 7% of ash contained in Mr. Grey's seed, 3.29% is, according to Mr. Hooper's analysis, so far as the seedling is concerned, waste matter because the plant does not benefit by it. This reduces the available percentage of ash contained in "Mr. Grey's extraordinary seed" to 3.71. Again Mr. Grey asserts that ordinary coffee seed contains only 2.6% of ash. This is in accordance with what Mr. Hooper, basing his statement on his analysis of Mr. Grey's ordinary seed, says. We have, however, reason to believe that Mr. Grey's ordinary seed was of poor quality for the following reasons: 1st, Because, as mentioned by P. O. of the 23rd January, figures given in Mr. Cochran's Ceylon Manual of Chemical Analysis, show that "raw" coffee (presumably minus both parchment and silver skin, as it was tested against roasted coffee) averages about 4.40% of ashes, some being as low as 3.97.

2ndly, If Mr. Grey's sample of ordinary coffee is to be taken as a fair sample of ordinary coffee all over Southern India, then "Coffee Planting" in S. India must be in a bad way. For what does Mr. Hooper (P. O., 23rd January) say: "The ash of No. 2 sample (Mr. Grey's ordinary coffee) is very poor, and is likely to produce a weak seedling and a poor plant liable to the attack of any disease . . . etc., etc." Again "the absence of this stimulus (i.e. potash and phosphoric acid) in No. 2 would be productive of a famine-stricken coffee bush, especially if it were planted in poor soil." In conclusion, let me state that I have seen many coffee nurseries and many coffee estates, but that amongst these "weak seedlings," "poor plants" and "famine stricken coffee bushes" have invariably been conspicuous by their absence.

I find on referring to P. O. No. 3, that Mr. Hooper in a supplementary report says:—"The moisture of the two samples of coffee was in the prepared sample 9.20% and in the original 10.73%. Making allowance for this water in calculating the ash on the absolutely dry coffee berry, the ash only just reaches 3%. This is decidedly low and much below the average yield of ash, which is about 4% in dry coffee." I presume that in the above "prepared sample" should read "extraordinary coffee seed," and original sample "ordinary coffee seed." If so, upon which of the samples is the calculation made?

"I."

March 31st, 1897.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.63	"	Phosphoric acid.

Orders booked for the coming crop of seed from the parent trees of above analysis at Rs. 3 per 1,000.

Manager, ARIENKOW ESTATE,
SHENCOTTAH,
Tinnevely.

COFFEE.

LIBERIAN COFFEE IN MALAYA.

IN South India the cultivation of this variety is still engaging, despite some most disheartening failures, the earnest attention of planters situate in districts where Arabica seems utterly played out. Perhaps in no part of the world has Liberian coffee succeeded so well as in Malaya. So a brief description of the condition and modes of culture obtaining there may be found of practical interest.

First of all the climate. The heat, it need scarcely be pointed out, is tropical, and warm at that. It is also decidedly moist, the average rainfall being between 90 and 100 inches, very evenly distributed; the greatest fall being 11 inches in October, and the least being just under 4 inches in June. The soil best suited for coffee, and found in abundance in the coast districts, is exceedingly deep, rich, and fairly friable. As a rule it is distinctly poor in lime. The favourite planting season is in the time of heaviest rainfall, i.e., April or October. The methods of sowing the seed seem very similar to the usual ones obtaining elsewhere. Germination previous to planting out in the nursery is preferred to direct sowing. A favourite treatment for leaf disease, which almost invariably attack the young plants in the nursery, is a solution of lime and sulphate of copper: two of the former to one of the latter, water according to severity of attack. Transplanters are in universal use, the commonest being a circular brass tube about nine inches long and three in diameter, surmounted by a long iron handle connected with each side of the tube. This tube is put over the top of the plant and forced downwards to six or nine inches below the surface. On being lifted upward, the plant comes out with an inch and a half of clean cut earth all round it. If the plant is six months old, and healthy, there will be an inch or more of tap-root extending below the soil, and this fragment must be cut off before the plant is taken to the field. The plant is pressed out of the transplanter and carried away (with others) in a box or basket, the soil still adhering to it. If the soil is inclined to crumble, dip the transplanter into a pail of water after extracting each plant. On arriving in the field they are distributed to the planters, who should scoop out a hole of sufficient size to admit the plant with its block of nursery soil; set erect in the hole, earth must be scraped together and pressed firmly around it.

For shading the young plants out in the field, ferning is not practised, the only things used being two flat stakes on either side of the plant. Permanent shade trees are generally planted up, the favourites being Ingasaman, Dado (a poor relation of our friend, E. lithosperma) and Albizzia, the last two being extremely quick-growing. Crops begin in the third year with about 2½ cwt., going up to 7 cwt. in the sixth and succeeding years. The value of the coffee locally, is fifty dollars or so per cwt. From blossom to crop there is a lapse of about eleven months.

The Ceylon system of pruning is followed, says a writer in the *Straits Budget*, in a modified form. "Local experience, however, has persuaded us that the Ceylon system in its entirety is too thin for our climate. We have more sun in Malaya, and consequently require a thicker tree. As a general rule, the tree is grown from one stem, but the result of an experiment of growing the tree from three stems—an experiment conducted over several hundred acres—has

produced such favourable results that we venture to predict that the several-stemmed tree will become more popular.

"If it is proposed to keep the trees low, pruning will first occur from eighteen to twenty months after planting, when the top of the tree will be cut off at from 5 feet 6 inches to 6 feet 6 inches from the ground. Suckers will be cut off flush with the tree (unless it is desired to re-develop the tree from a well-shaped sucker to increase the number of stems) and the centre of the tree kept clear, so that all the branches can freely grow outward. Like the suckers, all timber so pruned should be cut close to the trunk or branch from which it springs. It is a generally accepted rule that all fresh shoots within a handspan of the trunk ought to be removed; but, if you grow your tree from three stems, the tendency to send out fresh wood from the centre will be lessened. All dead wood should be cut back as far as the first living eye."

The chief manures used are much the same as in India, with the exception of Bat Guano, which we doubt not also exists in India.

The trees are planted, as a rule, ten feet by ten feet.

COFFEE.

Gautamala.

H. M. Minister in this country estimates last year's crop at 600,000 quintals, value about £800,000. It is interesting to note that the comparatively high prices enjoyed by Gautamala coffee is due entirely to the careful cultivation, plucking and curing in force.

Brazilian coffee.

The *Rio News* states that the work of setting out coffee trees in the municipal district of Ibitinga, S. Paulo, is progressing rapidly. There are now estimated to be about 2,000,000 coffee trees in that district. At Santos a committee of merchants estimates the next coffee crop for that port at 3,500,000 bags, and the quantity, belonging to the present crop, still to be received up to June 30, at 1,000,000 bags. The shipments of coffee in 1896 at the port of Santos were as follows:—From the State of S. Paulo, 3,817,258 bags; from the State of Minas Geraes, 237,810 bags: total, 4,055,068 bags. The official value of this coffee was 274,707,370\$314.

Liberian coffee in Travancore.

A well-informed correspondent tells us some very disheartening news of the recent threatened collapse of this variety in South Travancore. The oldest coffee (some 15 years' old or so) was, we understand, planted in long narrow strips by the banks of a stream. The jungle on either side of the coffee (which was not shaded) was left standing for a considerable distance on either side. Until quite recently the coffee did excellently well. Lately the sheltering jungle was cut down and planted up, with the almost immediate result of the cessation of crops on the old coffee. Other Liberian coffee also originally planted in the open, though at first coming on very well, appears to be now stricken with a sudden collapse. We should be obliged for the fullest particulars of the above case, as it is possible most valuable lessons may be learnt from this failure of Liberian in Travancore.

Albizzia fastigiata.

Central African coffee-planters have been long on the look out for a good shade-tree. They have heard of the "coming champion," *E. lithosperma*, and its vogue in South India, and have cast longing eyes on it. The danger of importing leaf disease therewith has alone prevented from a trial. They have tried many and various trees, among these blue-gums, and at last have hit upon an excellent indigenous variety, the *Albizzia fastigiata*. Mr. Brown, the "discoverer" of the tree, says that it is a coffee fertilizing tree and experiments have proved that "it possesses peculiar properties in bringing round exhausted soils, thereby causing coffee which has been worn out by age and cropping to renew its vitality and again become productive." The tree affords moderate shade sufficient to prevent evaporation, but not sufficient to shut out the light altogether. Not only is the benefit to be derived from light shade in this tree valuable, but some chemical process due to the roots has a most striking effect on coffee.

Green-manuring "ad absurdum."

Properly carried out, green-manuring is perhaps the best and cheapest form of fertilizing the land known. But some men seem to lose their heads over it altogether. We are personally acquainted with a planter of sorts who refuses to weed his coffee at all. On the principle that as land always improves under grass, the more grass under the coffee, the more liberally will the coffee be fed! We put this down charitably to simple lunacy. But from an African exchange we note the same sort of madness has infected some of the Nyassaland planters. One man has actually imported a grass of densely matted root-growth to plant in his coffee, in order to prevent wash. He will no doubt be entirely successful in obtaining a fine dense sward, with nothing but a few old coffee stumps to break the smooth lawn-like expanse.

Yet as some infatuated ones will hold that sneering is no valid argument, a few plain words may be useful. Coffee obtains 90 % of its food from the surface. Grass obtains all its food from the surface. It becomes a question of the survival of the fittest; one must die that the other may live. Allowing weeds to grow in the monsoon; i.e., the time of the heavy rains, is quite another matter, and is based on quite a different principle. During the whole of the preceding hot months, an abundant formation of nitrates has taken place. Unless temporarily caught up by weeds, these nitrates are simply washed out of the soil. The rains over, weeding can, and should, be proceeded with as quickly as possible and the weeds buried in shallow trenches or pits. It is obviously impossible to do this with grass.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.

(SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)

[Reprinted from the "*Madras Mail*" by the kind permission of the Editor.]

THERE exists such a general desire on the part of our readers to preserve the writings of the late Mr. Pringle

that we have decided to reprint the whole series in our columns. Planting science moves very slowly, and we doubt not that a great deal in Mr. Pringle's writings is still of as absorbing interest as in 1891, when the series was first commenced.

A few copies will be printed in pamphlet form, at Rs. 1-8 per copy: applicants should register their names with *Messrs. Addison and Co.*, Mount Road, Madras.

I.

THE ART OF MANURING.

The question of manuring coffee has had little systematic work spent on it compared with the vast interests at stake. Most planters have been content to use such manures as were most readily attainable, without bothering their heads as to whether or not they got an adequate return for the money spent on them. I have known live rubbish carted five miles—it could only in very rare instances be worth the cartage.

Selection of manure. In selecting a manure to be used on an estate we should be guided by the analysis of the soil, as well as by our knowledge of the composition of the coffee shrub and its requirements. One glance at the annexed analysis of three South Coorg soils will show that they require very different treatments:—

	Parts per hundred.		
	A.	B.	C.
Organic matter and combined water*	9.530	8.080	5.475
Oxides of iron and alumina	13.065	6.861	7.844
Lime	.522	.120	.380
Magnesia	.396	.446	.101
Potash	.044	.127	.042
Soda	.019	.063	.020
Phosphoric acid	.135	.039	.122
Sulphuric acid	.128	.079	.013
Chlorine	.003	.001	.002
Insoluble silicates	76.158	84.184	86.001
	100.000	100.000	100.000
* Containing nitrogen	.143	.292	.089
Equal to ammonia	.174	.355	.094
Moisture in air-dried sample	3.24	12.13	1.78

On A and C the great object should be to conserve the moisture by shade, and the use of as much good cattle manure, made by bedding the cattle with leaves and ferns, as possible. Both are rather short of potash, and one cwt. of nitrate of potash (nitre) per acre should be added to the manure; this will supply nitrogen as well as the potash, and C is very short of that most important element. A requires nitrogenous manures with potash, but a little bone phosphate should be added to prevent soil exhaustion. The following manure is recommended:—2 cwt. bone meal, 1 cwt. nitrate of potash. This should be mixed with 1 cubic yard of burnt earth or 2 bandy loads of cattle manure. It would be a sheer waste of money to apply lime to such a soil. B is very short of phosphoric acid, so bones in fine meal will be the best manure; 4 cwt. per acre will be enough, and lime may be used with advantage six months afterwards. To use oil cake as a manure to such land would be a pure waste of money. Lime used before the phosphates have time to act would lead to the rapid exhaustion of the land. It is a case where the indications of the analysis are very clear. On such land ammoniacal manures used without phosphates would never produce any results commensurate with expenditure, and would do more harm than good. The land as shown by the moisture is very retentive; drainage is therefore a necessity if the coffee is to be kept healthy. Over such land the shade may with advantage be

kept very light and thin. C, on the other hand, is a poor sandy soil, greatly wanting in moisture; shade should be kept thick, and leaf mould will render great assistance in retaining the moisture; cattle and organic manures will also give results beyond their mere manurial value on such land; in fact, on such places cattle manure is invaluable. For it are wanted cattle manure 2 tons with 1 cwt. fine bone meal, 2 cwt. pure dry fish, and $\frac{1}{2}$ cwt. nitrate of potash per acre.

These examples show how we may be guided in our choice of a manure by the soil analysis, and that a knowledge of the power of the soil to retain moisture will assist us in regulating the shade and decide many vexed questions of the best methods of cultivation to be followed in a given case. The system of cultivation that might be successfully worked on B. would not answer on C., for the whole treatment required is different, also the manures. So far I have mentioned, as coffee manures, cattle manure, bones, oil cake, and fish. Now let us examine these materials and see what we are dealing with. Cattle manure is first on the list. Its effects are as much mechanical as chemical, and where it has shown the best results I have generally found the soil possessed a very poor power of retaining moisture as in analysis C. Where cattle are kept solely for manurial purposes, cattle manure is very costly and does not always pay; when made by working bullocks it is a bye product, and often represents the sole profit on their keep. If it were not, it would often be just as cheap to hire bandies for the estate work. The actual cost of the upkeep of a bandy and bullocks in Coorg District is Rs. 23-15-4 per mensem. In full work the bullocks and bandy earn Re. 1 per day, and if they work 24 days out of 28 the profit is only 8 pice plus the manure. These two bullocks produce in 28 days 1,491 lbs. of manure, having the following composition when air dried:—

	Parts per hundred.	
	...	...
Moisture	...	7.94
Organic matter and combined water*	...	58.92
Oxides of iron and alumina	...	1.18
Lime	...	1.78
Alkaline salts	...	1.22
Phosphoric acid	...	.88
Insoluble matter, &c.	...	28.18
	...	100.00
* Containing nitrogen	...	.539

Fresh manure contained moisture 73.99 per cent. The dry manure is worth at the most for the manurial ingredient contains Rs. 8 per ton, the manure in its natural state about Rs. 2. Well bedded with bracken fern it may be assumed as an outside estimate that a pair of bullocks will produce one ton of manure, worth about Rs. 2 per ton.

The following is an analysis of a first-class cattle manure produced by bedding gram-fed cattle with bracken fern. The sample was taken in March and appeared quite dry; when powdered it looked just like brown-snuff:—

	Parts per hundred.	
	...	...
Moisture	...	25.83
Organic matter and combined water*	...	55.23
Oxides of iron and alumina	...	1.11
Lime	...	1.50

	...	100.00
* Containing nitrogen	...	.49
Equal to ammonia	...	.60 per cent.

Such a manure is exceedingly valuable on poor sandy soils, but is too short to be of much use in opening of heavy retentive lands, which require horse manure and straw litter to do good. Cattle manure should never be burnt, as its most useful character, its mechanical condition, is thereby destroyed, and it sinks to the value of wood ashes or less. We have seen that the manure is costly to produce. It is equally costly to apply.

The following table shows in lbs. what 10 tons first class gram-fed cattle manure in its natural state, containing 75 per cent. moisture, will yield. Many samples of cattle manure contain as much as 85 to 95 per cent. moisture; other samples are hardly cattle manure at all, being chiefly composed of lines' sweepings and other rubbish of little or no manurial value.

Comparative value of manures. The table also shows the quantity yielded by bones, fish, and oil cake:—

		lbs. per acre supplied by			
		10 tons cattle manure.	4 cwt. raw bones.	4 cwt. pure fish.	4 cwt. oil cake.

Cost of application ..	...	30	5	5	5
Total Rs.	...	150	18½	14½	16

* If the bullocks do not work, gram-fed cattle manure of that quality cannot well be produced for less.

Cost of application.

Should the amount put down for the application of cattle manure appear excessive; let the questioner work out the problem on the supposition that there are 1,200 trees per acre and that one basketful is given each tree. Each basket has to be filled, the distance to the tree and back traversed, and the basket emptied. Suppose that the coffee is moderately thick, and that the roads are 100 trees apart, then by the time the cooly has reached the fifty-second tree, it will be found that he has manured the twenty-third part of an acre and walked three miles. Taking the filling and emptying of baskets into account, he will seldom walk a mile per hour. At such work a cooly would consider 100 trees a hard task, and certainly it would be from 10 to 20 times as hard as putting out 4 cwt. of manure mixed with 1 cubic yard of burnt earth. The cost of application entered under bones, fish, and oil cake includes the cost of preparing 1 cubic yard of burnt earth and mixing it with the manure. This was given me by several managers as Rs. 2 and for application Rs. 3. So that taking cartage, &c., into account, it is not safe to estimate less than Rs. 30 per acre for cattle manure. In Ceylon, where cattle are often kept solely for manurial purposes, the cost is seldom much under Rs. 100 per acre, and with scanty grazing ground of the Coorg District it would be difficult to produce any quantity of cattle manure, and the small quantity produced, if the animals are well fed and bedded, cannot well be made under Rs. 12 per ton. Thus, except in the case of working bullocks, cattle manure of first-rate quality may be dismissed as too expensive for ordinary use, and we must look for some other manure.

Fish manure.

We find in good pure fish the cheaper native manure, where first class manure and oil cake, *i.e.*, castor hindy, may be looked upon as expensive luxuries, only to be indulged in where the poverty of the soil demands the use of an organic manure. Bones decompose very slowly in the Coorg District, and steamed bones

are preferable to raw on that account. They would also be in the finest meal possible if an immediate return for the money spent is expected. The use of inch bones in South Coorg might be termed manuring for posterity, as this generation will reap little benefit from them.

What coffee takes up. The coffee tree is not greedy; it does not ask for a large supply of food: a fair average tree at the end of the hot weather weighed 20 lbs. and had 17 primaries and 2,500 leaves. Such a tree will yield 5 cwt. of coffee per annum with its accompanying pulp.

Materials removed by	5 cwt. coffee.	Pulp.	Leaves.
Tri-calcic phosphate ..	4 lbs.	1	41
Ammonia ..	10 "	2½	135
Potash ..	9 "	6	101
Lime ..	2 "	1	90
Sulphuric acid ..	½ "	½	11

Valuable experiments.

The amount of material taken up by 5 cwt. coffee is very small. That removed by the leaves and prunings is what requires to be replaced by manure. As they decompose very slowly, the soluble salts yielded by them are lost in the monsoon rains and wash. The plant food is not there when the tree requires it to develop its fruit. Looked at from this point of view we must have in a manure that has to be applied at the end of July or in August all the plant food in an easily assimilable form and provide fully for the plant's wants. On this basis a coffee manure should have 40lbs. tri-calcic phosphate, 140lbs. potash and other manurial matters in proportion, if the tree has to depend on the manure alone for the supply of plant food. But the soil by slow decomposition and disintegration is also supplying food, and the tree appears to be capable of taking up ammonia, or some form of nitrogen compound from the air through the soil by its roots. The great question is what is necessary and how much? To help in the settlement of this question, I submit the aggregate results of some of my experiments giving the weight of clean coffee yielded. The results of 1889 and 1890 are added together in the following table:—

	4 cwt. yield lbs. per acre.	8 cwt. yield lbs. per tree.	4 cwt. yield oz. per tree.	8 cwt. yield oz. per tree.
Bones ..	833	752	13.77	12.84
Bones and fish ..	783	818	12.14	13.12
Fish ..	553½	655½	9.90	11.93

Average ...	761	779	12.35	12.95

The average yield from the 4 cwt. of manure is the same as from 8 cwt. practically speaking; at any rate, there is not sufficient difference to pay for the extra manure used. The results were also most entirely controlled by the shade; where it was, there the results were good and *vice versa*. This was particularly noticeable in the case of ammonia sulphate, where 4 cwt. yielded so much better results than the 8 cwt. One of the 8 cwt. plots was under dense jack shade, and the results were remarkably poor, worse than an unmanured plot not thirty yards off where the shade was thin. As regards nitre, the 8 cwt. had the advantage of the thin shade and the results are just the reverse of the sulphate of ammonia. Bones present a very curious illustration of the great effect of shade. Four cwt. gave 13.77 oz. per tree and 8 cwt. only 12.84 oz. When 4 cwt. of bones, the yield was only 13.12 oz., considerably less than when the bones were used alone. There was only one-twelfth of an acre, 100 trees on each of three estates, or a quarter of an

acre in all under each quantity of each manure, and on these small plots shade has had the power to mask and control the results; but in the aggregate they show that under shade 4 cwt. of manure will produce as good results as 8 cwt., and it is evidently folly to use more.

(To be continued.)

HIGHLAND COFFEE OF SIERRA LEONE.

(*Coffea stenophylla*, G. Don.)

THE Highland Coffee of Sierra Leone (*Coffea stenophylla*) is an interesting plant, as being, according to the *Botanical Magazine* t-7475, "one of the two indigenous West African species which in point of commercial value may prove a formidable rival of the Arabian coffee." It was discovered by Afzelius upwards a century ago; but was not published until 1834, when G. Don described it from specimens collected by himself at Sierra Leone. Sir Joseph Hooker remarks:—"It was regarded by Bentham, perhaps rightly, in the 'Niger Flora,' as a variety of *C. arabica*."

The plant is an evergreen shrub or small tree up to 20 feet high; youngest leaf-shoots are pink. Leaves four to six inches long by one to one and a half broad, bright green and glossy above, paler beneath; nerves, six to ten pairs, with small glands at the axils, which are white, and perforated on the upper surface. Flowers large, white, one to one and a half inches across the corolla lobes. Berry half-an-inch in diameter, globose. Seeds hemispheric, with a narrow ventral furrow.

It owes its name, "The Highland Coffee of Sierra Leone," to Dr. Daniell.

Mr. G. F. Scott-Elliot, F.L.S., the botanist to the Anglo-French Boundary Commission, in 1892, also collected specimens, which are now in the Kew Herbarium. Sir Joseph Hooker remarks that these are of a very slender shape, with lanceolate leaves only two to two and a half inches long by one-third to two-thirds of an inch broad, very different from those represented in the accompanying plate, "and these together favour the opinion entertained by Bentham, that both are forms of *C. arabica*, Linn."

Mr. Scott-Elliot's account (*Kew Bulletin*, 1893, p. 167) is as follows:—

"*Coffea stenophylla*, the narrow-leaved 'wild,' 'bush,' or 'native coffee', is sometimes found wild in the hills, and is more often cultivated than the Liberian. It grows very freely, and yields quite as much as the Liberian, but is somewhat longer in coming into bearing. Both the natives and French traders at Freetown say that it has a superior flavour, and prefer it to the Liberian. In fact, latterly a certain amount has been exported to a French dealer, who is said to sell it at 4 frs. 50 cents a lb. as 'best mocha.' Considering that it is worth at Freetown 6d. a lb., this should be a fairly profitable trade, and a trial shipment should be made by the English merchants to find out exactly what the market value in Liverpool would be. The plant appears to thrive best in the higher hills about Sierra Leone on gneissose or granitic soil and can be grown at from 500 to 2,000 ft.

The plant, from which the accompanying plate was produced for the *Botanical Magazine*, was raised at Kew from seed sent in May 1894 by Sir William H. Quayle Jones, late Chief Justice of the West African Settlement and Deputy Governor of Sierra Leone.

The circumstances under which the seed was collected is given in the following despatch communicated to Kew by the Colonial Office:—

Deputy Governor, Sierra Leone, to Colonial Office.

Government House, Freetown, Sierra Leone.

April 10th, 1894.

My Lord Marquess,—In reply to your Lordship's Despatch, No. 15, dated the 23rd January last, transmitting a copy of a letter from the Director of the Royal Gardens, Kew, asking that a few pounds of fresh and authentic seed of *Coffea stenophylla* may be obtained and transmitted to him for distribution to the botanic stations in the West Indies, which request your Lordship desired should be complied with if possible, I have the honour to report that on the arrival of Mr. Crowther, the curator of the Gold Coast, in the Colony, I inquired what was being done in the matter, and on learning that it was said to be too late to obtain seed, and as authentic seed was required, and we have no expert in the Colony, I asked Mr. Crowther to be so good as to endeavour to obtain some

seed, and if it was not possible to do this now, to be good enough to ear-mark some of the coffee plants of the authentic kind, so as enable us to supply authentic seed when obtainable.

I am glad to say that Mr. Crowther was able to obtain some of the seed required (nine pounds), which he certifies as true seed, having seen it growing before it was gathered, and also gave instructions for its being packed.

The coffee is being addressed to the Director, Royal Gardens, Kew, and will, if possible, be despatched by s.s. "Sherbro," which takes this despatch.—I have, &c.

(Signed) W. H. QUAYLE JONES, Deputy Governor.

The Most Honourable the Marquess of Ripon, K.G. &c. &c.

Plants raised from the seed, above mentioned, flowered at Kew early as September 1895, in one of the tropical houses. Supplies of seed and plants of this coffee have now been distributed to the Botanical Institutions in India and the colonies from whence, if the plant resists the coffee disease and proves to be as excellent a coffee as the French merchants declare it to be, good results may be expected.

The results of the introduction to the West Indies are so far of promising character. The plants have not, however, thriven so well as could be wished at Dominica and Ceylon. In the *Report of the Botanic Station at Dominica for 1895* it is stated:—"A few plants of *Coffea stenophylla* were planted at the station, and twenty plants distributed in couples to various planters who expressed a desire to try them. Some are reported as thriving well; others are not satisfactory. The plants put out at the station are by no means successful as yet, one only being in a really healthy state."

From Trinidad the prospects are more encouraging. In Mr. Hart's *Annual Report for 1895* we find:—"From seed of this new coffee sent from Kew, a number of plants have been raised. Some of the larger plants have been planted in permanent positions, and are now over three feet in height, and it is expected will flower in a few weeks for the first time."

At the Castleton Gardens, Jamaica, Mr. Fawcett is able to report:—"Fifteen plants of *Coffea stenophylla* raised from seeds from Kew have been planted in different places about the garden and are doing well." From the *Report of the Director of the Royal Botanic Gardens, Ceylon, for the year 1896*, we learn:—

"A small plantation of 36 plants of Sierra Leone or 'upland coffee' (*Coffea stenophylla*) received from Kew in 1894 was made in April, and plants of *Lonchocarpus* sp. (the one used in Trinidad as a shade tree for Cacao) planted among them for shade. The growth of the coffee plants has been very irregular, varying from a few inches to 3 feet, and cannot be said to be very promising. They have the appearance of plants out of their element, and look as if the climate here did not suit them. On the other hand, the *Lonchocarpus* certainly at home, having grown very rapidly with a branching habit, and it promises to be a very useful shade-tree at low elevations. Some of the shoots have grown 8 feet in nine months."

The Director of the Botanic Gardens and Forest Department, Straits Settlements, refers to the African coffee in his *Report for the year 1895*, as follows:—

"Among these [economic plants] is a small lot of the new coffee (*Coffea stenophylla*) a plant spoken very highly of. It is growing steadily and well, and at present does not appear to be affected at all by disease. Plants have been distributed to coffee planters in different parts of the Peninsula for experiment and observation."

TEA.

Natal tea in London.

We notice for the first time Messrs. Gow, Wilson and Staunton's Tea Circular of the 19th March a section devoted to Natal tea. Only one estate, however, is represented, the average price being but 6½d. for Pekoe and Broken Pekoe. Not a brilliant beginning, but we hear that several Ceylon merchants have spied out the land and are determined to push the industry all they know.

The duty on tea.

We have now arrived at the period of the year, says the *H. Colonial Mail*, when budget anticipations are the order of the day. Sanguine experts conjecture that the surplus

will reach the highly satisfactory figure of two millions. If this calculation should prove to be accurate, those interested in the tea industry may fairly claim a remission of the impost which now presses so heavily on their produce. Tea yields a revenue of nearly four millions a year. It is generally looked upon as being one of the prime necessities of life. The bulk of the tea consumed is British product. As we have repeatedly pointed out, the duty is regarded by "the man in the street" as a tax on food, and nothing would be more popular at home than for the Ministry to take the line we have advocated of reducing or abolishing the impost. Anything that would benefit India at the present juncture, now that she is the victim of plague and famine and consequent depression in business, would be ungrudgingly allowed even by the many financial interests that always scramble for the crumbs which fall from the table of the Chancellor of the Exchequer in surplus years.

This is strongly supported by the *Grocer*.

Thus saith "P", a well-known planter of ability, *re* our notes in our last issue:—

It has become a fairly well-recognised fact that flavour is rather improved than deteriorated by manuring, and also that heavy pruning does not to affect the quality of crop must be accompanied by heavy manuring.

The majority of S. India planters who really prune heavily are careless regarding first pluckings, which must be watched most carefully to form the bush, and not to unduly exhaust the sap, which is of course in full flow.

The principle I have always followed is that deep pruning should be undertaken early in December, or late in April to avoid damage from hail. That the piece of tea so treated should be at once deep-hoed and afterwards trenched and prunings buried in with heaps of manure. If pruned in December and so treated, first flushes (not tipping) will be ready in June or July, and if carefully attended to, the yield will exceed that of previous years, viz., if the plot had given 250 lbs. previously in the season after treatment, it should give 300 lbs. or thereabouts, notwithstanding the loss of early flushes, and the ensuing season should give five maunds at least.

In conclusion, do not prune heavily unless you are prepared with large supply of manure, for though the cost is heavy, both quantity and quality will soon cover the expense.

P.

Prunings for caffeine.

It was stated in a late issue of our paper that 3d. per lb. for tea refuse, i.e., prunings of tea bushes, could never pay for packing and freight home and manufacture, &c. This was on the supposition that the full tea rates would be charged. Which is wrong. As it would not matter in the slightest degree how the tea intended for the manufacture of theine was either packed on the estate (baling would be all that could be required) or stowed away in the holds, expenses under both these heads would be enormously reduced. So that 3d. per lb. would probably result in an appreciable profit. Have any of our readers, by the way, the slightest conception of the yield that strippings from prunings could result in? No less than 600 lbs. made "tea" per acre. So that even if the profit per lb. were infinitesimal, the aggregate returns would be respectable enough. Were the trees liberally manured (not pruned), it should be possible to get as much as 2—3,000 lbs. of strippings for theine per acre. We doubt whether there would be any need at all for withering in such cases. A sort of magnified

coffee roaster would be enough to drive off what little moisture there was. A large ragi-hand-driven mill to crush the leaf into dust and a cheap press to jam the stuff into chests or bales would suffice.

Theine is most abundant in the young shoots, so that the second and succeeding strippings, say 4—5 in the year, should yield more satisfactory results in every way.

The Home Market.

There has been a further diminution in the quantity of Indian teas brought forward, says the *Produce Markets Review*, referring to the sales of the 26th March, but owing to the falling off caused by the sudden rise in values the bidding was inactive. Prices, generally, for the medium and lower grades, were less firm; many of the Calcutta-bought invoices were neglected, and a good portion withdrawn, although holders were willing to accept easier rates than those of last week. For better descriptions the market is steady, as their values have not been affected by the rise in the common sorts, although the demand has been adversely influenced by the speculative movement in the latter. As these teas are not likely to be in excessive supply, their values will no doubt be maintained, and probably later on higher rates will be established. The finest sorts, which are not largely offered, meet with a good inquiry at steady to firm prices, and as the imports are now drawing to a close, an advance on current rates is not unlikely. Latterly there have been complaints respecting the inefficient bulking and inspecting, and a considerable number of parcels have been thrown up in consequence; in fact, there have been several instances where teas have not been bulked either here or in India. It has been always understood that bulking should be thoroughly carried out where necessary, and the trade have relied on the merchants to see that this was fairly and efficiently done, so that the small public sale samples fairly represent the bulk. Formerly the word "bulked" was printed on the top of each invoice, but of late this has been very generally discontinued, and consequently buyers have no guarantee that the teas bid for in public sale have been bulked. To obviate this it will be necessary that the assurance as to bulking should be reinserted in the catalogues, as was formerly the case; otherwise the confidence hitherto placed in the sale samples will be shaken, and endless complications will arise. There has been little change in the position of Ceylon tea, the market remaining firm, with a slight improvement in the demand. Broken Pekoes continue to be offered much in excess of requirements, and the best value on the market now obtainable is in these kinds, but the finest grades are still scarce, and the late full prices have been well sustained. The inquiry for whole-leaf teas is still strong, and the late rise has been fully maintained, although the sales contained a larger proportion of the commonest grades. Supplies have again been on a moderate scale, as will also be the case next week, so that any alteration in prices in a downward direction is not likely at present.

THE TEA TRADE IN 1896.

WHAT Messrs. Geo. White and Co. have to say on the tea trade is always worth listening to, and their Annual

Report which we give below is no exception to the rule. The prospects are not exactly brilliant, but, granted the American and other markets are vigorously attacked, fairly encouraging. A very marked decline is observable in the retail prices, a large proportion going into consumption at 1s. to 1s. 4d. per lb., while 1s. 6d. and 1s. 8d. is considered a liberal figure for the better kinds. Over-sorting, to which we referred in our last issue, is touched upon: "As a rule sorting into too many grades is inadvisable. A Broken Pekoe of say 30 chests or more; a good Pekoe of 50 chests or over; a Pekoe Souchong of 70 chests or over, with a break of Broken Tea or Pekoe Fannings will be probably found to answer." Sift out all dust and pack by itself.

An important note is that given on the growing demand for "self" teas, *i.e.*, large breaks of one character. Small gardens might pass their coarser leaf through an equalizer and mix up all again as unassorted. This would reduce the number of samples to be tasted, and be a great convenience to small shippers by enabling them to send full-sized breaks, *i.e.*, a minimum of 20 chests of one kind. Broken Pekoes steadily decreasing in favour afford another ground for this style.

In the analysis of the District Teas, South India comes off very poorly, Travancore often lacking strength and the Nilgiris wanting in their traditional fine flavour.

We have omitted, for want of space, the elaborate statistical tables so liberally given in the report.

LONDON, 31, FENCHURCH STREET, E.C.,

22nd March, 1897.

As anticipated, supplies both from India and Ceylon have been much heavier than in the previous season. The Home Trade was however prepared for this, and assisted by an increasing export demand, succeeded in dealing with them, the more easily as shipments from China show a decrease of over 5 million lbs., while Java also has sent rather less.

India. Calcutta estimates of the crop published at intervals again varied considerably, ranging from 125½ million lbs. to 132¼ million lbs. for the United Kingdom, though even if the larger amount be reached it will not all come on to the London market, as probably 3 to 4 million lbs. will be transhipped "overside" to America, Canada, and elsewhere, besides what goes direct to other ports in Great Britain. Last year for instance, 121½ million lbs. were actually sent from Calcutta, whereas including shipments from South India, only 118½ millions were received into the London Bonded Warehouses.

Quality from all districts was as a rule ordinary, there being a lack of really fine, though Darjeelings and Docars were on the whole better than in 1895, while from Assam there were a few good invoices in July and August, after which they were disappointing in cup until the arrival of the Autumn Teas in December, when some very choice ones were received, and brought high rates. The finer grades being comparatively scarce, other descriptions were abundant, which led to a low range of price for fair Pekoes and useful Pekoe Souchongs. This depression, unsatisfactory at the time, has had a salutary effect on consumption at home, and also brought these Teas prominently to the notice of buyers abroad, so that deliveries for the last six months of 1896 were 62,420,000 lbs., against 59,382,000 lbs. in the same period of 1895.

From the 1st July, 1896, to the end of February last, the average for 890,000 packages sold on garden account, was 9½d. per lb., contrasted with 9d. per lb. for 800,000 packages in the corresponding portion of 1895-6, and 10½d. per lb. for 733,000 packages in 1894-5. It must be borne in mind, however, that although freights were mostly favourable, exchange was adverse during the principal portion of the season.

Ceylon.

Total shipments from this island during 1896 were 108,000,000 lbs., and in 1895 and 1894 they amounted to 98,000,000 lbs. and 84,500,000 lbs. respectively, while to Great Britain they rose to 93,936,000 lbs. *versus*

85,753,000 lbs. and 75,350,000 lbs. in the two previous calendar years. For the same twelve months the quantities sold in London were as under:—

1896,	1895,	1894,
1,049,000 packages;	950,000 packages;	876,000 packages;
(Average, 8½d. per lb.)	(Average, 8½d. per lb.)	(Average 8½d. per lb.)

showing a decline of ¾ths of a penny per lb. on the increased yield. Deliveries corresponded fairly well in the same time to the large weight to be dealt with, being 6¼ million lbs. over those of 1895, greater quantity taken for the continents of Europe and America rendering valuable assistance in disposing of the surplus.

In the period under review the weekly averages, which opened in January at 9d. per lb., did not fluctuate so much as in 1895, the highest recorded being 9½d. per lb. in November while the lowest was 7½d. in June, whereas in the year before they were 10½d. per lb. in January and 7½d. per lb. in June, rising again to 9½d. per lb. in December.

Generally speaking quality was of a useful description, but there was less choice flavoured, partly due no doubt to rather coarse plucking, and also to inclement weather at the time of manufacture.

Java. These Teas fully maintained their position particularly when they were the produce of plants raised from Assam or Ceylon seed, for which good rates were usually obtained. Owing to drought the outturn was considerably curtailed, and only 25,000 packages were offered at Public Auction from 1st July, 1896, to 28th ult., *versus* 37,000 packages for the same time in 1895-6.

The total amount exported from the United Kingdom during the past eight months, compared with the two previous years, is as follows:—

	India.	Ceylon.	Total British Grown.	China.	Java.
	lbs.	lbs.	lbs.	lbs.	lbs.
July 1, 1896 to end of Feb. 1897	3,952,000	6,131,000	10,083,000	13,954,000	605,000
" 1895 "	2,736,000	4,856,000	7,592,000	12,385,000	720,000
" 1894 "	2,391,000	3,443,000	5,834,000	14,220,000	538,000

and the distribution for three complete years, as taken from statistics furnished by the courtesy of H. M. Customs, was:—

		Continent of Europe.	United States.	Canada.	Other Countries.	Total.
		lbs.	lbs.	lbs.	lbs.	lbs.
India,	1896 ...	1,809,000	903,000	847,000	841,000	4,400,000
Ceylon	" ...	4,685,000	1,408,000	1,266,000	1,137,000	8,496,000
Java, &c.	" ...	767,000	88,000	31,000	172,000	1,058,000
China	" ...	11,089,000	1,979,000	1,918,000	4,341,000	19,327,000
Totals ...		18,350,000	4,378,000	4,062,000	6,491,000	33,281,000
India,	1895 ...	1,592,000	909,000	780,000	693,000	3,974,000
Ceylon	" ...	3,820,000	1,423,000	1,034,000	870,000	7,147,000
Java, &c.	" ...	658,000	111,000	61,000	163,000	993,000
China	" ...	9,751,000	1,075,000	2,206,000	5,407,000	18,439,000
Totals ...		15,821,000	3,518,000	4,081,000	7,133,000	30,553,000
India,	1894 ...	1,570,000	709,000	711,000	509,000	3,499,000
Ceylon	" ...	2,715,000	812,000	958,000	639,000	5,124,000
Java, &c.	" ...	704,000	152,000	37,000	195,000	1,088,000
China	" ...	12,711,000	1,558,000	3,160,000	4,539,000	21,968,000
Totals ...		17,700,000	3,231,000	4,866,000	5,882,000	31,679,000

In addition to the above it is computed that about 3¼ million of India and say, 1½ million lbs. of Ceylon (as against 2½ and nearly 1 million lbs. in the previous year) were delivered "overside" from the Port of London on arrival for immediate transshipment to other countries, and therefore were not taken account of in Imports to the United Kingdom.

The following figures will show the Exports from Calcutta to Colombo to other Ports than Great Britain, the latter market showing considerable development:—

	Australasia.	Asia.	America.	Continent of Europe.	Total.
	lbs.	lbs.	lbs.	lbs.	lbs.
Shipments from Calcutta ...	Season 1896-97—6,062,000	4,222,000	1,927,000	437,000	12,648,000
" " ...	1895-96—6,581,000	4,918,000	1,084,000	276,000	12,859,000
" " ...	1895-95—4,817,000	3,761,000	588,000	240,000	9,406,000

Shipments from	12 months	1896	1897	1898	1899	1900
Colombo.		11,807,000	1,388,000	719,000	618,000	14,532,000
"	"	1895—	9,390,000	1,187,000	394,000	890,000
"	"	1894—	7,477,300	1,053,000	216,000	345,000
"	"					9,191,000

The Board of Trade returns (which embrace statistics from all the Bonded Warehouses in the United Kingdom) for the past three calendar years were:—

	Home Consumption.	Export.	Total Deliveries	Bonded Stock, Dec. 31.
	lbs.	lbs.	lbs.	lbs.
1896 ...	227,786,000	33,281,000	261,067,000	106,345,000
1895 ...	221,800,000	30,553,000	252,353,000	101,336,030
1894 ...	214,341,000	31,879,000	246,020,000	99,503,000

From the above it will be seen that Home consumption showed a steady increase, also exports from here, particularly those of British growth as given on the previous page.

Allowing for expansion at a similar rate, our requirements during the twelve months may be set down at 270,000,000 lbs., of which—

India will probably send (including the Madras Presidency)	135,000,000
Ceylon " " "	100,000,000
Java " " "	5,000,000
Leaving China to supply, say	30,000,000
	270,000,000

Prospects.

With every indication of larger demand for British-grown Tea from nearly all quarters of the globe, and a gradual extension of the Home consumption, the outlook is fairly favourable, especially as the present scale of values is moderate for all descriptions, and judging from the estimates, supplies from India and Ceylon for the current year, although heavier, are not likely to prove excessive.

It will be interesting however to observe the results of the introduction of machinery and modern systems of manufacture in the produce of China, although it is not considered probable that the amount shipped from that country to Great Britain will be augmented thereby, at all events for some time to come.

The vital point to those interested in the Tea industries of India and Ceylon is the price which their productions will realize. The tendency is no doubt to a lower rather than a higher range. Writing on the 18th March, 1887, we said, "The public has been accustomed to cheap (*i.e.*, low-priced) Tea, and the 1s. 8d. and 2s. canister have been reduced to 1s. 4d. and 1s. 6d." Even allowing for 2d. per lb. reduction in the Duty since then from 6d. to 4d. per lb., there has been a further marked decline in the retail price, a large proportion going into consumption at from 1s. to 1s. 4d. per lb., while 1s. 6d. to 1s. 8d. per lb. is considered a liberal figure for the better kinds.

This tendency to a shrinkage in value, together with a possible higher rate of exchange, makes it more than ever a matter of necessity that the sale of British-grown Tea should continue to be pushed in countries other than Great Britain with all possible vigour. Considerable progress has undoubtedly been made as regards Russia and the Continent generally, as well as in Canada and the United States. To a great extent this result has been brought about by the good work done by both the India and Ceylon Tea Associations and those working in conjunction with them, but it is of paramount necessity that their efforts should be persisted in with even greater stress than heretofore.

Manufacture.

This important subject is evidently receiving more attention year by year, both in India and Ceylon as machinery improves, but there is still room for the application of science to some of the stages of withering, fermentation, and drying.

In 1881, with reference to this we wrote:—"There is little doubt that large quantities of leaf properly grown, and even properly withered, are spoilt annually for want of knowledge in the details of curing, which we believe is still in its infancy. The leaf after plucking has to pass through certain stages of fermentation and chemical action, which ought to be carried on with the utmost care and supervision,"—and, in 1885, we likewise suggested that a specialist should be appointed to experiment with a view to afford information to Garden Managers on these points.

The matter has also recently been commented upon in one of the leading trade journals, viz.:—*The Produce Markets Review*, which expressed the opinion that it would amply pay Planters to engage the best scientific assistance to study the chemical constituents of the leaf under different conditions of soil, weather, and blights, also of the various changes it undergoes in withering, drying, rolling, &c.

If such researches as these were successful, Teas of more uniform

quality might be sent throughout the season than is now often the case, and thus the wide fluctuations in value, occasionally as much as 6d. per lb., sometimes seen in invoices from the same Garden be avoided. Could this be accomplished, it would be of great benefit, as the want of the present day appears to be a regular supply, similar in appearance and cup, so that blends may be kept up to a fixed standard, while exporters would also welcome such a system which would enable them to match previous purchases without much difficulty.

As shown by experience, moderately fine plucking on the whole gives the best results, but managers will of course be guided by circumstances. For instance, in parts of Darjeeling, Assam and Ceylon where choice quality can be produced, a finer style may be adopted, whereas in low-lying districts where quantity pays best, the leaf would be allowed to become coarser.

Size of Breaks.

No alteration has been made since last year for India Teas, but the limits for large breaks of Ceylons have been raised, and they now stand as under, viz.:—

India—20 Chests, 30 Half-Chests, 50 Boxes. Ceylon—18 Chests, 24 Half-Chests, 40 Boxes.

Breaks of lesser size are sold separately at the close of the auctions.

Assortment.

In view of the increasing output already alluded to, any plan that will help to lower cost of production or facilitate the handling of his Teas after arrival on the market, will no doubt receive careful consideration from the Grower and those interested with him in the Industry. The whole crop from India has practically to be dealt with in about six months. During this busy period, when large quantities are also coming forward from Ceylon, buyers complain of the succession of small shipments which are often despatched at short intervals from the same estate, and this should, if possible, be obviated. As a rule sorting into too many grades is inadvisable. A Broken Pekoe of say 30 chests or more; a good Pekoe of 50 chests or over; a Pekoe Sou-chong of 70 chests or over, with a break of Broken Tea or Pekoe Fan-nings will probably be found to answer. Dusty parcels are not readily saleable and therefore this should be sifted out and packed by itself. The exception to the foregoing is when a tippy Broken Orange Pekoe or Orange Pekoe can be made, as these when really fine usually command high figures, whether from India or Ceylon.

There is, however, a growing want for "self" Tea among both the Home Trade and Exporters, and it is a question whether from gardens which are unable to send large breaks this could not be met in the shape of an "unassorted" Tea, not a coarse rough leaf, such as is perhaps generally understood by that name, but with an even appearance obtainable by the use of an "equaliser." When a certain "brand" became known, and buyers could count on regular supplies of the same mark, it would be a great benefit to them, by lessening the number of samples to be tasted here, and a saving of labour and time in sorting at the factory. An additional reason for adopting this style is the greater demand now-a-days for leaf kinds in contradistinction to Broken Pekoes, which are not used in such large proportions as formerly by the Home Trade, while shippers hardly ever take them.

ANALYSIS OF CROP.

Assam.

The crop has on the whole been good, particularly a few of the early arrivals, while towards the close of 1896 and commencement of 1897, some shipments came to hand possessing full autumn flavour, without the undesirable reddish appearance generally characteristic of the dry leaf of cold weather pluckings, which were much appreciated and sold well, thus favourably influencing the year's average of many gardens. During 1896 the yield was about 59½ million lbs. against 55½ and 53½ million lbs. in 1895 and 1894 respectively.

Cachar and Sylhet.

These districts sent fair ordinary Teas, being as a rule well made with useful infusions, and the result to date is rather better than that of the corresponding previous eight months. There was also an increase in the output, it being 45½ million lbs. compared with 39½ and 37½ million lbs. for 1895 and 1894.

Darjeeling and Terai.

Although the number of choice invoices was comparatively small, the out-turn on the whole was more desirable than that of the previous Season, and the average of the larger quantity was ½d. per lb. higher than in 1895-6. Yield for the three Seasons—11½, 10½, and 10 million lbs.

Dooars.

Quantity manufactured was again larger, which with more useful quality, gave a pecuniary result of ½ths of a penny per lb. higher than in the year before. Many of the Teas had full colour infusions, which commended them to the Trade, while

others, though not so thick in cup, were flavoury. Yield for the past three years, 22, 20, and 16½ million lbs.

Chittagong.

Shipments were of an ordinary type, and receipts heavier, being rather over 1,000,000 lbs. compared with 800,000 lbs. and 860,000 lbs. in 1895 and 1894.

Kangra, Dehra Doon and Kumaon.

Quality of these was again disappointing, there being a scarcity of really fine. The produce of the two latter districts is however principally sold locally. Yield has not varied much, being about 4½ million lbs. for the last three years.

Travancore and S. India.

Arrivals from the Madras Presidency have shown little or no change for better, probably owing to unfavourable weather. Travancore often wanting strength, while most of those from the Neilgherries lacked the fine flavour which renders them valuable. From Travancore a slightly increased amount was received, viz., 2¼ million lbs., against 2 and 1½ million lbs. in 1894 and 1893.

Ceylon.

Taken altogether the crop has been of a useful description, the proportion of rough leaf and poor liquoring kinds having been smaller, while evidences of improvement in style of manufacture have been apparent. From 1st July last 677,000 packages passed the hammer realising 8½d. per lb. against 627,000 packages in the corresponding period of 1895-6 which brought 8½d. per lb. Total Exports from Colombo for the past three years were 108,000,000, 98,000,000 and 85,000,000 lbs. respectively.

Java.

Quality has been fully maintained in the produce of this island, especially in Teas manufactured from plants raised from India or Ceylon seed. Severe drought curtailed the yield during a portion of the season, and shipments to this country were only 3½ million lbs. *versus* 4½ million lbs. in 1895.

ROUND THE BUNGALOW.

NOTES BY A PLANTER'S WIFE.

Getting up lace.

In Devonshire lace is wound firmly and evenly round a small white board covered with soft clean white calico stitched lightly over it.

The lace is wound from one end round and round, the top of one round overlapping the edge of the previous one; three or four layers can be put on, and the end or ends secured by stitching down. This is all covered again with a clean white wrapping not too thick, stitched firmly and evenly over it. Then the board is held upright in a basin full of hot suds and scoured vigorously with a scouring brush; it is then put into a pot on the fire and simmered a while in more suds. When taken out, the boards are all wrapped carefully in thick white towels and set aside to dry, a process which occupies several days. When quite dry, the covering is taken off and the lace unwound, and it then looks like new. No irons or stiffening are used. The most fragile and delicate lace may be washed in this way. Black lace which has got rusty may be restored by soaking in ammonia and water, or by washing in milk and water. It should never be rubbed.

Sponging out a headache.

In case of an ordinary nervous headache from which women suffer so much, says an authority, remove the dress waist, knot the hair high upon the head, out of the way, and while leaning over the basin, place a sponge soaked in hot water, as hot as can be borne, on the back of the neck. Repeat this many times, also applying the sponge behind the ears; and, if the assertion of the writer is not a mistaken one, in many cases the strained muscles and nerves that have caused so much misery will be felt to relax and soothe themselves out deliciously, and very frequently the pain promptly vanishes in consequence.

Keeping butter.

To preserve butter as long as possible in its fresh state, it should first be thoroughly washed so as to retain no milk, and then placed into a crock and pressed firmly into it in order to expel the air. Sufficient room should be left in the crock for a layer of fresh water to cover the butter, and so prevent its contact with the air. The water should be frequently renewed.

Another method is to wrap up the butter in a damp cloth of white linen, care being taken to keep the linen always damp. The object of this method being also to keep the butter from contact with the

air, it is advisable to use comparatively thick and coarse cloths, as they retain the moisture longer than finer ones, such as gauze, etc. The water makes the threads of the cloth swell and prevents the air from penetrating through; and as it evaporates, it also repels the air and tends to keep the butter at an equal temperature.

Housekeeping for bachelors.

So frequently have I been asked by bachelors what amount they should spend for housekeeping expenses, that I think a few lines on this subject may be useful as a guide to many of our young planting friends.

It would of course be quite impossible to give any hard and fast rule for expenditure under this heading, as tastes differ so much in many things, also what one man may think ample for living on, another may think a miserable pittance. However, as most assistants on an average I should think do not draw more than Rs. 100 a month. I will try and keep these remarks within their reach, and those drawing more pay can of course indulge in a more luxurious style of living if they please.

It is a rule among many young men to pay a certain amount of money into the butler's hand and let him do the whole of the catering in his own sweet way; this is, I think, a great mistake, as it makes one so much less independent, and in the hands of one's servant who thinks he can then buy and serve inferior articles of food for his master, and the surplus goes into his own pocket. Another grave mistake is paying one's butler too highly; neither is it fair to pay as much to a servant who has only one person to serve, as those who have families, and it makes it very hard to get a servant, at least a good one, when bachelors pay them in some cases as much as Rs. 17 a month. Then when it is a poor man who cannot pay so much as this, and says so, the servant in nine cases out of ten refuses to go to him, saying that such and such master paid him this amount and he will not think of taking less.

Surely it would be better if every young fellow in a neighbourhood were to make up their minds not to pay more than a certain amount to their servants and stick to it, it would then be fair all round. It is quite possible to get a good butler for Rs. 12 a month and with a good warm coat given him at Christmas, he will generally be satisfied. On most coffee estates there are certain allowances, such as kitchen coolie and tappal coolie, and where these are allowed, it is only necessary for a bachelor to pay two servants, i.e. butler and dhobie.

I will give as nearly as I can a list of things necessary every week with prices as in my district, and monthly as per Ootacamund prices, with an outline of using the same for one week, which will serve as a guide for other weeks also, with of course variation in the menu given.

THE MADRAS EQUITABLE ASSURANCE SOCIETY.

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. George.

Invested Funds exceed ... Rs. 22,00,000 | Gross Annual Income exceeds ...Rs. 3,00,000

BOARD OF DIRECTORS.

The Hon'ble Mr. GEORGE G. ARBUTHNOT, (Arbuthnot & Co.,) Chairman.	SUTHERLAND ORR, Esq., (Barclay, Morgan & Orr.)
G. LOXDALE MURRAY, Esq., (Murray & Co.)	W. GORDON, Esq., (Mercantile Bank of India, Ltd.)
	O. HALL, Esq., (National Bank of India, Ltd.)

Medical Adviser.—Brigade-Surg.-Lieut.-Colonel A. M. BRANFOOT, M.B.

Actuary.—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

- Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.
- Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes being sufficient proof.
- Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have been paid.
- Agency in London for receipt of premium ^{and} — for payment of death claims. _{or}
- On Policies transferred to the London Register, death claims will be paid in England at the current exchange on Madras without production of Indian Probate or Letters of Administration. Premium may be paid in London at 2s. per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Drafts on Madras.
- The Society's Funds invested in India Government Securities only.
- Directors must be residents at Madras.
- Members consist of all holders of policies either on their own lives, or on the lives of others, for the duration of life.
- General Meetings held Annually—not later than the end of March, in every year.
- Auditor elected by Members. Accounts audited Annually.
- Valuation of Society's affairs must be made quinquennially.
- The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums paid during 1891—1895. Thus the premium on a policy for Rs. 10,000 on the life of a person, aged 34 years, Civil Rates, on which the original half-yearly payment was Rs. 225 during 1891—1895, is reduced to only Rs. 56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.
- Term Policies issued at moderate, non-participating Rates.
- The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesdays and Saturdays, between 11 and 12 noon.
- For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

Total Rs. ...	57	10	0

In the monthly account you will notice there are some few items that will not be required every month, such as capers, vinegar, salad oil, vermicelli, macaroni, etc., and in the months these are not required other things may be substituted, keeping the account as even as possible every month.

In buying meat it will be best to buy it fresh twice a week,—beef one half of the week and mutton the other. We will suppose we get the beef, shin and suet on Wednesday and mutton on Saturday or Sunday. We will now see how we can manage on the things given in the above list. Beginning on Wednesday for breakfast. Menu for one week.

Wednesday, Breakfast.—Beefsteaks fried with onions and tomatoes, Mashed Potatoes, Bread, Curry and Rice. Dinner.—Clear Soup, Roast Beef, Potatoes and Peas, Stewed Figs.

Thursday, Breakfast.—Cold Beef and Salad, Dry Curry and Pepper Water, the remaining Stewed Figs. Dinner.—Julienne Soup, Bubble and Squeak, Chocolate Blanc Mange.

Friday, Breakfast.—Beef Cutlets with Mashed Turnips, Dry Curry. Dinner.—Carrot Soup, Stuffed Tomatoes, Beef à la mode, Rice Pudding.

Saturday, Breakfast.—Beef en Persillade, Vegetable Curry. Dinner.—Vegetable Soup, Cauliflower Omelette, Minced Beef on Toast, Roly Poly Treacle and Cocoanut Pudding.

Sunday, Breakfast.—Fried Eggs on Toast, Toad in the Hole, Chicken Curry. Dinner.—Pea Soup, Half Leg of Mutton stuffed and roasted, Stewed Apricots with Custard.

Monday, Breakfast.—Slices of the Cold Mutton fried and served with a border of Spinach, Chicken Curry hot. Dinner.—White Soup, Shank end of Leg of Mutton boiled and served covered with Caper Sauce, Jam Puffs.

Tuesday, Breakfast.—Eggs à la Bonne Femme, Irish Stew, Cabbage Curry. Dinner.—Mutton Soup, Vegetable Marrow stuffed, China Chilo, Cottage Pudding.

Herewith I give recipes for one or two of the dishes mentioned, which are perhaps not quite so well known as others.

Chocolate blanc mange. Take two large teaspoonfuls from a tin of chocolate and milk, pour over this a large breakfast cupful of boiling water, put this over the fire in a small saucepan, and when boiling thicken with a

tablespoonful of cornflour previously mixed with a small quantity of cold milk or water, boil for five minutes longer after putting in the cornflour; when sufficiently cooked pour into a small mould which must first be washed out with cold water, and the mixture poured in while the mould is still wet. When cold turn out and serve plain or with custard.

Fried eggs on toast. Allow one egg for each person, break very carefully and separate the yolk from the white, beat the white until it is like snow, put the white into the cup with the yolk (which must not be broken) and pour both into a small frying pan, in which there is a nice quantity of boiling fat or ghee, fry until the yolk of the egg is just beginning to set, dish up on a slice of fried or buttered toast and garnished with fried parsley.

Eggs a la bonne femme. As many eggs as required, two or three slices of beetroot, chicken or any other cold meat, and one or two lettuce. Boil the eggs for ten minutes, roll them to break their shells on the table, shell them, and cut them in halves, and just cut off the point of the white so that they may stand well. Take out the yolk and fill the white cup thus: two with beetroot (already boiled) cut into tiny dice; two with cold chicken or meat cut into dice; two with tiny dice of the yolks piled up in them. Cut up some coss lettuce very nicely, lay it on the dish, and place the eggs on it. I think most of the other dishes are well known, but if there are any which are not, I will be pleased to give the recipe. It will be noticed I have not put anything down for milk, as this is generally to be had for nothing from the estate cows. If, however, it has to be bought, one rupee a week should be allowed, getting seven or eight bottles for the rupee; half a bottle morning and evening is quite sufficient and allows plenty for puddings, sauces, etc. After all these items have been deducted from an income of Rs. 100, it leaves, roughly speaking, about Rs. 40 per month for personal expenses, household linen, papers, books and sundries. I would again, as in one of my former letters, impress upon one and all the importance of cleanliness, and of having every meal served in a clean and dainty manner. A small meal nicely served is far better than a loaded table, with dirty and stained table cloth, cloudy and greasy glasses, etc., and costs no more. You must make your servant understand that you always expect to have your table cloth clean and flowers on the table. If you are particular about this when you are alone, it matters not who may turn up to breakfast or any other meal, you will feel sure your table and the way in which the meal is served will be according to your wishes. I have said nothing about chota hazri and tea, as these can hardly be called meals, and there is generally a cutlet or two or some little odds and ends from other meals that come in handy, for chota with eggs, potted meat or jam is quite sufficient. Coffee is usually allowed free on coffee estates. I have, however, put down both tea and cocoa in my monthly list as one likes a change in these things. In most cases I would have any pudding or sweet that may be left over from dinner served after the curry at breakfast, and thus nothing is wasted.

Daisy, Australia. Thank you for the two recipes so kindly sent, which are printed below. I am always glad to receive recipes or articles from my correspondents.

Hop beer. For 6 gallons of water: ¼ lb. of hops, 2 oz. ginger, 3 lbs. of white sugar. Put the water on the fire; when it comes up to the boil, put in the ginger (which must first be bruised), sugar and hops in a thin muslin bag, in the water, and let it boil briskly for two hours. Take it off, and take out the bag; let stand 24 hours, skim, strain, and bottle, tying down the cork securely, or put in a barrel. It will not keep longer than one month.

Hare pudding. Cut your hare in small pieces, lay in a saucepan, a heaped breakfast cupful of green peas, one carrot sliced fine, one onion, cloves and cinnamon to flavour, pepper and salt to taste, one tablespoonful of butter, a cup and a half of water. Now make a paste with 1 lb. of flour, ½ lb. mutton suet finely shred, one teaspoonful of baking powder, sufficient milk to make a very stiff dough, put on top of meat, place saucepan on the fire, and cook for two hours, being careful it does not burn. Cold meat cooked in this way is also very good.

NOT EVEN IF IT COST TWENTY SHILLINGS.

A NOTABLE percentage—about one-third, I think—of the power of a steam engine is used up in overcoming the friction of its own parts. Hence inventors are constantly testing devices to reduce friction. Yet they can never overcome it; and the resistance created by it represents power (and hence expense also) absolutely lost.

Now the human body is a machine propelled by heat, exactly as an engine is; and anything that retards it may be considered as friction. Very good, then.

You have noticed great differences in your own vigour. Some days you work easily, and on others with difficulty. This is so whether you are chiefly a muscle-worker or a brain-worker; or a mixture of both—as most people are. Occasionally you are able to do more work in a day than at other times you can do in three. It is the odds between walking on smooth, hard level ground and dragging yourself uphill through wet clay. What wouldn't lawyers, authors, clergymen, and all other brain-workers give for something having the power to keep their minds clear and strong? Or body-workers for something that would prevent aching, weakness, and fatigue? Do I know what will do it? No, I don't. If I did, I could retail the secret for more money than is stowed away in the Bank of England. But I do know one thing, and will tell it you in a minute—for nothing.

First, however, we will talk of Mr. J. B. Goss and the friction he tried so long to overcome. Mr. Goss is a large farmer living at Stradsett, near Downham Market, Norfolk, and is well known in his district. When the farmers meet on market days, he often speaks of his experience and how he came out of it.

In order to cover it all, he has to go back fifteen years—to about 1878. At that time he began to feel the signs of some disease which he could neither account for nor understand. At first he merely realised that he was out of condition. His work became less and less a pleasure and more and more a task. From his business his thoughts turned upon himself, and no man can work well in that form. Then he and his victuals began to disagree, which is a state of things to make a man ask what can the reason be?

He had a well-provided table, of course; yet he often sat down to his meals and couldn't touch a morsel. Mr. Goss knew that this would never do. If a man expects to live, he *must* eat. There are no two ways about that. So he ate more or less—although not much without the stimulus of an appetite; he forced it down, as you may say. But this wouldn't do either. When the stomach goes on strike it can't be *whipped* into working before the question at issue is properly settled.

Thus it ended in his having great pain and tightness at his sides and chest. "I was constantly belching up a sour fluid," he says, "which ran out of my mouth like vinegar. I had a horrible sensation at the stomach for which I was not able to find any relief. For nights together I could get no sleep; and in this general condition I continued for five years, no medicine or medical treatment doing more than to abate some of the worst symptoms for the time being.

"In the early part of 1883 I heard of a medicine which was said to do good in cases like mine. Whether it would help me of course I had no idea. After so many things have failed, one naturally has no faith in a new one. Yet I got a supply and began with it. In a short time it was plain that I had come upon the real remedy at last. My food agreed with me, and soon all pain and distress gradually left me. Since then (now ten years ago) I have kept in the best of health. If I, or any of my family ail anything, a dose of Mother Seigel's Curative Syrup—the medicine that cured me—soon sets us right. We have no need of a doctor. (Signed J. B. Goss, March 24th, 1893.)"

Mr. Goss once said that if Seigel's Syrup cost 20s. a bottle, he would not be without it in his house. We can easily believe him. Considering what it did for him—and does for others—it would be cheap at any price. Yet, like plenty of things of the highest practical value, it costs but little. The reader can imagine under what difficulty and friction Mr. Goss must have done what work he did during those five years' suffering with indigestion and dyspepsia.

This then, we know: that life's friction and loss of power comes chiefly from that single disease, and that ease arises from the use of Mother Seigel's great discovery.

ADVERTISEMENTS.

PROTECTED
BY

JADOO

ROYAL LETTERS
PATENT.

The new material in which every plant thrives without earth, and which has proved as invaluable to Planters in the Tropics as to Amateur Gardeners at home.

Head Office—PALACE GATE, EXETER.

DEPOTS AT LONDON, LEITH, GLASGOW, AND LIVERPOOL.

Foreign Agencies—BORDEAUX, COGNAC, BREGEYED (DENMARK), FRANKFURT-ON-MAIN, CALCUTTA,
MADRAS, CAPE TOWN, KINGSTON (JAMAICA), COLOMBO.

JADOO LIMITED.

CAPITAL—£50,000 in 50,000 Ordinary Shares of £1 each.

A portion of this capital has been reserved for Colonial applications.

Directors:

COLONEL HALFORD THOMPSON, J.P., Eastcliff, Teignmouth.

C. M. VEITCH, J.P., Royal Nurseries, Exeter.

ST. JOHN KNELLER, Oriental Club, London.

T. K. ROBERTS, Fairhill, Exeter.

H. GORDON HODGKINSON, The Holt, Dawlish.

J. LITTLEJOHN, Glencoe, Pennsylvania, Exeter.

GEO. FOSTER, The Hawthorns, Dudley.

Solicitors: ROBERTS & ANDREW, 10, Bedford Circus, Exeter.

Bankers: FOX, FOWLER & Co., Exeter.

Auditor: P. J. LIDDELL, 21, Gandy Street, Exeter.

Secretary: H. VODDEN.

Investors should consider the meaning of a MONOPOLY of a material coming into general use for growing "supplies" for Tea and Coffee Gardens in the Tropics, or replacing Vines in one single district in France, and judge for themselves as to the return they are likely to get on Capital invested in this Company, bearing in mind that the raw material used to make JADOO is practically inexhaustible, and that as trade increases the prime cost will steadily decrease, as labour will not form nearly so large a proportionate item on a large trade as on a small one.

Full Prospectus, with Testimonials from all parts of the World, on application to PARRY & Co., Madras.

MARKET SUPPLEMENT.

SATURDAY, APRIL 17, 1897.

COFFEE.

Messrs. R. J. Rouse & Co.'s Weekly Coffee Report (March 26, 1897) says:—A rather steadier tone has prevailed at Public Sale this week, but the market shows a further decline owing to the heavy supplies offered.

Over 2,700 bags East India were brought forward and all disposed of at a reduction of 1/- to 2/-, except fine Home Trade Marks which are fully maintained.

Costa Rica continues to form by far the greater part of the catalogues, and the demand being slow, values show a further fall of 2/- to 3/- except for the fine colory qualities which are unchanged.

Futures after some slight fluctuations close unchanged to 6d. dearer since last week.

Messrs. Patry & Pasteur's Report of the Colonial Markets for the Week ending March 24th, 1897, says:—Bank rate 3%. Bombay Exchange closes at 1s 3 $\frac{3}{4}$ d. Brazil Exchange 8d. Rupee paper 3 $\frac{1}{2}$ % 63 $\frac{3}{8}$. Silver 28 $\frac{1}{2}$ d per oz.

The demand at auctions has been much quieter this week, consequently the large supplies catalogued sold very irregularly. Holders are anxious to realize, and in many cases have accepted considerable reductions, especially for the ordinary qualities, which shew a decline of fully 3s per cwt., whilst fine close about 1s lower. The moderate quantity of East India offered sold at about 1s to 2s decline.

Brazil markets are dull and lifeless.

Daily receipts have averaged 8,143 bags in Rio, and 10,143 bags in Santos.

Futures have been entirely under the influence of daily receipts in Brazil, which at the opening of the week were large, and caused a further decline; to-day, however, they shewed a decided falling off, the result being a corresponding advance in prices, and the market closes steady at a decline of 6d to 1s, viz.:—Good average Santos in Havre, March delivery closes at fcs. 55.00, in Hamburg pf. 45 $\frac{1}{4}$, and No. 7 low ordinary Rio in New York \$8.30.

To-day's London official quotations are:—

	March	May	Sept.	Dec.
Rio	42/3	42/6	42/9	43/-
SANTOS	43/9	44/-	45/3	45/9

Re-exports of Indian and Ceylon Tea are encouraging, but the increased quantity sent to Canada is partially due to the fear of an alteration in Tea duty in the dominion.

SUPPLEMENT TO PLANTING OPINION.

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, MAY 1, 1897.

[No. 9.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 14th May 1897.

Central Travancore.

prospect of continuing.

PEERMAAD, 27th April.—Weather.—Rainfall to date for month 4.21, for year 9.63. *Crops.*—Tea flushing well and every *General Health.*—Good.

N. Mysore.

YEDAHALLI, 29th April.—Good showers of rain fell on 17th, 18th and 20th. Over two inches were gauged at taluq kutcherry. I hear the blossom showers on the neighbouring estates have failed. The bridge-work at Thadasa continues to make rapid progress, and was inspected on the 27th by the Inspecting Engineer. Days extremely hot, and more rain wanted to admit of ploughing operations being begun.

North Wynaad.

MANANTODDY, 26th April.—Weather.—11th to 14th heavy dews at night, misty mornings and sea-breezes, more or less strong, P.M. 15th thunderstorms commenced and continued daily thereafter till 22nd. Heaviest fall was 95 cents on 16th, which was the means of bringing out the second coffee blossom of the season on 24th. Total

rainfall from 15th to 22nd 1.70. Prospects for next coffee crop are not very bright. *Plant diseases.*—None. The orange-coloured enemy's last virulent attack has left its mark in the shape of much undeveloped and abortive spike. *General Health.*—Less feverish since showers have fallen. *Labour.*—Lots. *Grain.*—Much paddy being carted away to Coast.

S. E. Wynaad.

PUNDALUR, 28th April.—Weather.—From the 15th to 22nd April every evening from 3 P.M. to 7 or 8 P.M. we have had good showers and since during the day very hot and cool at nights. *Crops.*—Blossom setting but it can hardly be estimated. *Interesting Items.*—Ever since the gold mining companies left Wynaad, the Kurumbers and Punniers have worked the crushings privately. An arrack vendor at Pundalur went to the Nellyalom palace and got a license for a fortnight to try for gold on Phoenix Mill house; he got 24 tolas of solid gold, besides some quicksilver from the crushings; this news got around and the Nellyalom Ranees washed and got 71 tolas of gold. Now Yencatasawmy and M. Nuthar Saib are paying heavy rent and are washing. The reports written by Mr. Brough Smythe before the advent of the gold mining companies were true. The companies brought money from England and took it back by paying very highly for managers, miners, machinery, travelling and shipping charges, etc.; when the money was exhausted they had not sufficient to work the mines properly and thereby closed all the mines. Messrs. Punnett and Mitchell also took gold out on Richmond from the crushings; I do not know how many tolas; this shows that there is gold in Wynaad but requires good working. The companies at Kolar have learnt good lessons in Wynaad and did not spend money headlong at the beginning, and as they are progressing they are increasing labour machinery and buildings, etc.; this is what is keeping them up.

Nilgiris.

SHOLUR, 24th April.—Rainfall to date from 1st January 4.75. Temperature between 6 A.M. and 6 P.M., 59° and 81°, respectively. Tea flushing very freely, and heavily pruned coming on exceptionally well. Labour for the time of year very plentiful. Health fairly good, except a few cases of fever and slight dysentery amongst children. 26th April.—High dry winds have checked flush a bit, but the previous favourable weather had made bushes run away.

This is not altogether to be regretted, so early in the season, as it allows the trees to make wood and "form."

COONOR, 29th April.—On the day following my last report we had a very heavy thunderstorm, followed up by another on the 22nd, besides a few casual showers in the interval. Total for fortnight 3.21 inches, or 3.34 for month up to date. High elevation estates blossoming at intervals; taken all round there are strong hopes of an average year at least. Tea going strong and flavour improving. Labour sufficient. Health fair.

GENERAL NOTES AND ARTICLES.

We understand that the Baron von Rosenberg, of the Kanan Devans, has devoted not a little time and trouble to drawing up a practical scheme for the working of planting banks. The result of his investigations would be well worth publication.

An investment.

Men on the look out for a good investment for their capital might do worse than attend the auction sale of Pandilands estate, advertised elsewhere by Messrs. Oakes & Co., Ltd., to take place on 29th instant at Ootacamund. The land is virgin forest.

Kodaikanal.

A Ceylon resident, now in Kodaikanal, writes to a Ceylon paper:—
"The air here is dry, a great contrast to the damp of Ceylon. The scenery is grand, as this place is situated over 7,000 ft. above the sea, and rises from the plains in about 15 miles. Living is cheap in consequence—a great contrast to the high prices all over the upcountry of Ceylon. Supplies have only to be carried a short distance, and everything is done on a system, so that you pay only the amount of cooly-hire in excess of the prices ruling in the plains below. Now that such an excellent steamer and railway service has been established to South India from Ceylon, it is a wonder that so few Ceylon residents avail themselves of the opportunity of coming to this place, which is pronounced by some competent authorities the best sanitarium in South India.

"At present Colonel Tidy and family are the only Ceylon visitors here, besides Missionaries. It is a great place of resort for the latter, especially those from Jaffna."

Market Funds.

Touching on the matter of a special fund for pushing the market for coffee, our contemporary the *Madras Mail* recently had a sensible article on the subject. The writer points out very truly that, as the U. P. A. is in fact truly representative of the whole planting industry of South India, the formation of special funds to push any separate branches of the industry, e.g., coffee, tea, &c., should be undertaken under its ægis. At present the funds contributed by South Indian tea-planters go direct to the Indian Tea Association. It were advisable that in future the contributions should pass through a special Tea Committee of the U. P. A., and thence remitted to the Calcutta body. For the purposes of pushing our coffee markets, a similar coffee committee could be formed, the funds for its disposal being raised quite outside the general U. P. A. income. In this manner there could not be the slightest fear of the rival claims of our two great staples clashing.

Selection of seed.

In England wheats are bred, in America maize and corn, and out here coffee and tea may be in the same way improved immensely by a proper selection of seed as we have very many times pointed out. In the Straits Liberian seed of the 4th or 5th generation of selected stock fruits earlier, and has a distinctly

larger fruit than the ordinary run of the coffee and the crops are heavier. Out of any given number of coffee trees some always crop earlier and heavier than others. Some have a large bran, some a small. Some are liable to any sickness that is in the air and some are very hardy. Now take the hardiest, heaviest bearing of the early croppers and plant the seed and from them select on the same principle the best trees; from which take the seed again at the end of 4 or 5 generations. You will find a distinct variety which should not only crop earlier and heavier but have a larger bean and be more hardy. Of course if you can conduct your experiment away from the other coffee with only tea, cinchona or jungle round the experimental field, success will be more assured. The Liberian seed from Wellington estate in the Straits has been thus selected and gives the best Liberian coffee I have ever seen.

Planting Banks.

A good deal has been said of the advisability of starting Agricultural Banks for Indian ryots. Many of the objections urged against their introduction do not lie against a similar scheme for planters. And yet there can be no doubt that, as a rule, Planting Banks would do as much for the planting community generally as the Agricultural Banks for the ryot. There are many tried men, young and old, who would eagerly "start on their own account," and open out for themselves, could they only obtain the necessary capital at an easy rate of interest. For a planter without capital must drudge along as Superintendent or Manager to the end of his planting days, happy if he dies in harness. The necessity for such an institution is too patent to need further remark. It is a very different thing when we have to consider how such an institution may be started. From first to last it must be a mutual undertaking, supported and managed entirely by planters. There are no hopes of starting with any large capital. Yet if a beginning is made, by wealthy proprietors contributing a few thousand rupees each, in a short time the fund will mount up very quickly. Naturally the loans at first advanced would have to be very small, but with the increase of capital, the help afforded would grow in proportion. The ruling idea in such an undertaking would be to lend the money at the lowest possible rates of interest, and in return to obtain the best security available. In Italy, where the system of Agricultural Banks has developed enormously, it has been found to be a perfect success. The loss by bad debts is practically nil; this factor is a very important one to bear in mind in this connection. Anyone attempting to defraud the Bank would be in the position of attempting to cheat his friends and neighbours. The certainty of the treatment meted out in such cases practically enforces the most rigid honesty. In the case of planting banks, practically every planter would be, to a greater or less extent, shareholder. And a very sharp eye indeed would be kept on the transactions of the borrower by his much interested neighbours.

TERMS MODERATE.

THE MYSORE BOTANICAL GARDENS.

THE annual report of these gardens for the year 1895-96 has just reached us. There is a great deal of interesting information therein as usual, and we heartily congratulate Mr. Cameron, the able Curator, on the successful way he is managing the gardens under his care.

In publishing the following extracts, we may remark that the services of trained and skilled native gardeners can be obtained by application to the Curator :—

Viticulture.—The experiments under this heading are conducted on a limited scale at Seringapatam and Bangalore.

The vineyard in the Daria Dowlat Bagh, at the former place, is the property of Government and consists of 30 vines planted over an area of 1,584 square yards. The first planting was done in October 1894, when six healthy canes of the following hot-house grapes were put down :—

- | | |
|-----------------------|--------------------------|
| 1. Foster's Seedling. | 4. Gros Coleman. |
| 2. Black Alicante. | 5. Muscat of Alexandria. |
| 3. Lady Downes. | 6. Gros Maroc. |

These have grown satisfactorily and produced their maiden crop of fruit last June. In July 1895 the Kashmir vines were planted, 24 in number. These consist exclusively of the wine-producing varieties named in my annual report of 1894-95. The growth in this case is also fairly satisfactory.

At first, there was difficulty about irrigation, as the channel water is often cut off just at the time when it is most needed for the vines. But now that a small well has been provided, the difficulty is perhaps overcome. It is only during the forcing period—from end of March until the beginning of June—that irrigation is required.

A second crop is taken by some growers in the cold season, but unless the first crop has failed, it is wiser to be satisfied with one and let the vines have a good rest.

The other vineyard, which contains 53 vines planted over an area of 2,617 square yards, is the property of Her Highness the Maharani-Regent, and is included in the Palace Gardens at Bangalore. Table grapes of excellent quality, such as the Black Hambro', White Frontignac, and Aurungabad, have been grown in this garden for many years, and it is partly due to this fact that Government wished to extend the operations of grape-culture generally. The Dewan, Sir K. Sheshadri Iyer, K.C.S.I., has himself taken the lead by planting a vineyard of perhaps greater extent than either of the foregoing in his private garden at Bangalore. A few of the local raiyats have also planted, and should others wish to do so, every facility will be offered in the matter of supplying cuttings from good stock. Only one or two of the wine-producing varieties are included in the Palace vineyard. In addition to three unnamed kinds, the following are doing well :—

- | | |
|--------------------------------|-------------------------|
| 1. Black Hambro'. | 5. Gros Coleman. |
| 2. Aurungabad, purple-fruited. | 6. Buckland Sweetwater. |
| 3. Do. white-fruited. | 7. Foster's Seedling. |
| 4. White Frontignac. | |

Sisal hemp—*Agave rigida sisalana*.—The work of the Gardens has been to propagate rather than to cultivate this useful plant. Without the approved means of extracting the fibre quickly, at the proper stage of growth, cultivation means waste, as under favourable conditions of growth, the plant would soon run to seed and become useless for commercial purposes.

In 1894, the nursery contained 3,000 to 4,000 plants: in 1895, one thousand plants were handed over to Mr. Geo. Ricketts, of the Forest Department, for actual cultivation, and at the present time the Lal-Bagh nursery contains about 6,000 plants. We have therefore sufficient stock to commence operations in a small field of suitable land. The Sisal hemp plant is easily propagated and perfectly hardy, as, indeed, all the fibrous aloes seem to be in the Mysore climate. There need be no hesitation to cultivate, although the introduction of suitable machinery to extract the fibre is a *sine qua non*, if cultivation is to become an industry. In this connection also might be tried the Mauritius hemp plant, *Furcraea gigantea*, and the Mexican aloes, *Furcraea longæva* and *F. Beddinghausii*, of which the Gardens possess thousands of young plants. We have also an etiolated form of the Mauritius hemp plant, *Furcraea gigantea*, which promises to yield a very delicate fibre.

With regard to machinery for extracting the above fibres, Article

CXLIV. of the Kew Bulletin for 1890 furnishes detailed information which would enable an engineer to construct a machine of the approved pattern. But there may be subsequent inventions of which information could be obtained from Florida, where the fibre industry has attained great results.

Rhea fibre—*Boehmeria nivea*.—With the advent of new inventions for the cheap extraction of this valuable fibre, there has been a brisk demand for plants to cultivate. But for many years there was no demand, and now that a reaction has set in we are not so well prepared for it. The stock of plants in the Gardens—originally a large one—had dwindled down to a limited quantity. But active propagation has been resumed and numerous plants will soon be provided by the division of tubers and insertion of cuttings. Being a monœcious plant, it is strange that local specimens have never seeded. *Boehmeria nivea* is indigenous to the Malay Islands, China and Japan. It is cultivated in India at various centres, but mostly in Assam and Bengal, where it appears to be domesticated to some extent. The Burmese and Indian species of *Boehmeria*—of which there are 10—may, in some cases, be mistaken for the true Rhea plant. The latter has been cultivated in the Lal-Bagh for upwards of 20 years and is perfectly hardy. Our long, dry season does not kill the plant, although during that period it hibernates to a great extent and is unproductive of cane. With sufficient irrigation, it grows all the year round and would give at least three cuttings of cane.

The most profitable course would be to select suitable sites for extensive natural growth in the Malnad districts of Hassan, Kadur and Shimoga, as a hardy plant possessing such valuable fibre cannot fail to bring revenue to the State at some period or another.

Forage plants.—The want of a hardy perennial to supply green forage during the rainless months of the year is much felt by the raiyats in most parts of India, and although many grasses and other plants of this class have been recommended for the purpose, from time to time, none have exactly fulfilled the requirements of the case. Among perennial plants already tried and mostly found unsuited are, *Symphytum asperum*, Prickly Comfrey. *Guazuma tomentosa*, Bastard Cedar. *Panicum sarmentosum*, Mauritius grass. *Atriplex nummularia*, and other species of the salt bush. *Panicum dumetorum*, Guinea Grass. *Lathyrus sylvestris*, Wood vetch. *Medicago sativa*, Lucerne. *Polygonum sachalinense*, Sachalin. *Cytisus proliferus*, Tagasaste.

Of the abovenamed, the Mauritius and Guinea grasses have proved useful, but they are somehow unpopular with the raiyats. Lucerne is extensively grown as a dietary corrective for horses. The ornamental grass referred to in last year's report, and now identified as *Thysanolaena Agrostis*, Nees, deserves a place among forage plants. It is indigenous to the subtropical Himalaya, where it attains to a varying height of 4—12 feet. Cattle are very fond of the whole herbage, and the culms remain green throughout the year.

A perennial grass of this sort, grown in the moist districts of the Malnad, would afford a large outturn of forage, and having a railway skirting the hills in some parts, it would be easy to distribute green food along the railway line.

Fruit trees at Nundydroog.—Varieties of the peach, imported from England, are doing very badly, while, strange to say, the Indore peach has grown splendidly. English apples and pears have not done well, although there are now signs of better growth in the former. A few varieties of the dessert pears have been grafted on to the Nilgiri cooking pear which succeeds well on the hill. By this means it is hoped to establish the better kinds that do so badly on their own roots. Propagation being the principal object of this garden, it is fortunate that the Nilgiri pear is so well established. The tree tomato, *Cyphomandra betacea*, succeeds well, the elevation being about 4,700 feet where the garden is situated. The trees reported to have made good growth last year are still progressing. But as they begin to bear fruit it is feared that the monkeys, which are again numerous, will do much damage. The orange, lime, citron, and other Aurantiaceous species planted on the top of the hill have much to contend with.

No sooner does a young leaf appear than it is attacked by voracious insects, of which a species of grasshopper and one of a caterpillar are the most destructive. Then constant exposure to wind and weather at an elevation of 4,850, with long periods of drought and an occasional fire, are equally injurious conditions. But a number of trees have attained some growth in spite of all these retarding forces and may eventually bear fruit.

New trees under trial.—The most interesting of these are—

(a) *Zizyphus jujuba*, a new variety of the Bhere or jujub plum from Mauritius, where it is called the "Masson variety." A few healthy seedlings have been planted out experimentally.

(b) *Erythrina umbrosa*, "Mother of cocoa." In tropical America this tree is greatly prized as a nurse and shade to cocoa plantations.

(c) *Erythrina lithosperma*.—Similar properties are now claimed for this tree in the eastern cultivation of coffee. A number of thornless seedlings have been raised from seed supplied by Mr. B. Nelson of Arienkow, Shencottah. Being furnished with numerous tubercles on the roots, the species is said to assimilate nitrogen largely, as in the case of clover or field beans. It is also said to be an evergreen tree, which is exceptional in the Indian *Erythrineæ*. A tree combining these useful qualities would be of great importance to the coffee planter.

(d) *Albizia moluccana*, another shade tree of the *Leguminosæ*. A number of seedlings are now available for distribution. There are some fine trees at Rochdale Park, where, it is said, the growth exceeded an inch daily during the monsoon.

The two species of mahogany, *Swietenia mahogani* and *S. macrophylla*, are now well established at Bangalore. The introduction of these useful trees is due to Dr. Geo. King, Superintendent of the Royal Botanical Gardens, Calcutta, who has made the Lal-Bagh presents of seeds for many years. The fine avenue tree, *Sterculia alata*, has been extensively propagated from seed supplied by the same benefactor.

Indigofera anil.—Seeds of this shrub, which is the indigo of tropical America and the West Indies, have been procured for local trial. Persons who are interested in this cultivation, in Mysore, should apply for seed and information.

Seed from grafted coffee.—Mr. F. G. Parsons, of Coorg, kindly presented a few coffee berries taken from the grafts supplied to him in 1892. The donor was of opinion, and so is the writer of this, that the beans were larger and heavier than is usually found in the ordinary *C. arabica*. The seed germinated, but was subsequently lost through an oversight in watering. But the seedlings raised by Mr. Parsons himself will, no doubt, be watched with interest. A few grafts now growing in the Palace Gardens are shortly expected to fruit.

Nepal pepper.—A small bagful of this superior chilli was presented by Colonel H. Wylie, C.S.I., the British Resident at Nepal. Steps are being taken to secure local cultivation on some scale. This variety affords the finest of all chilli-powders.

Achras sapota.—The sapodilla plum fruited in quantity at the close of the hot season. But the fruit is not very popular.

A NEW METHOD OF TREE PLANTING.

THE following very interesting description of what may be termed "Care Stump" planting forms No. 5 of the N. W. Provinces Agricultural Series. It is possible that planters, in dealing with two-year old "stumps," may find the new method of great service.

PREFACE.

The following article from the "Meldura Cultivator" regarding a new system of tree planting initiated by Mr. H. M. Stringfellow, of the United States Department of Agriculture, is published as a Departmental Bulletin for the information of fruit-growers in these provinces.

The writer strongly urges that when one to two-year old trees are planted, the roots be cut back to stubs about an inch long and the trunk pruned to a branchless whip from 1 to 3 feet high. It is maintained that by this means new roots grow strong and deep, almost directly downward, thus avoiding the drought that often affects the surface roots of young trees planted in the ordinary method. Successful experiments are cited in support of this method, and especially a peach orchard of 100,000 trees planted in Georgia in this way.

It is directed that the roots be cut cleanly in a horizontal plane, a hole 2 inches in diameter dibbled in well-worked soil, the tree inserted, and the earth tramped close around it. The system has been proved by Mr. W. Gollan, Superintendent, Botanical Gardens, Sahāranpur, to answer admirably in India in the case of apples, vines, peaches and plums, provided that they are operated on when dormant, or in these provinces from the 20th December to 20th January. It is not advocated for mangoes, leechies, oranges, loquats or other ever-green fruit trees, and can only be successfully followed between the dates named.

D. C. BAILLIE,

Director, Land Records and Agriculture,
N.-W. Provinces and Oudh

THE REVOLUTION IN TREE PLANTING.

About eight years ago it was announced by Mr. H. M. Stringfellow, a Texas orchardist of large experience, that the theory and practice of tree planting, as handed down from time immemorial, were wrong, and that instead of a tree being the better for having numerous roots when reset, the very opposite was true. Mr. Stringfellow then gave a full history of how he happened to hit upon this truth as well as a detailed account of various experiments upon a great many kinds of fruit and shade trees that seemed to demonstrate the truth of his statement.

The statement did not at that time meet with much support, so absurd did the idea of cutting off all the roots of a tree seem to even the most prominent horticulturists. Mr. Stringfellow, however, "stuck to his guns," and in a recent issue of the *Texas Farm and Ranch* he again dealt with the subject, and at the same time he gave the experience of other horticulturists in support of his contention. The article is reproduced below for the consideration of our readers:—

"Though I have written to quite a number all over the country the invariable answer has been, 'while such treatment may succeed with you, it would be out of the question here.' The fact is we inherit our opinions and ideas, just as well as the peculiarities of our bodies, and so true is this that the contrary of their beliefs is positively unthinkable to many men. An instance of this came to me in a letter from one of our most progressive nurserymen. He writes: 'I have been practicing close root-pruning with perfect success for some years, and yet my father, who is seventy years' old, and sees the good results every year, won't admit them, but persists in saying that 'if the roots were not necessary they wouldn't be put there.' So firmly, indeed, has this long root fallacy become embedded in the human mind by ages of practice, that even a man of Charles Downing's eminence in horticulture declares in his great work that the 'ideal transplanting' would be to take up a tree with its roots entire.

"That this would be absolutely the very worst form, anyone could easily demonstrate for himself. Let him take, for instance, a peach or other tree seeds, and plant a few inches apart in, say, a two inch pot of good rich soil. At the end of next year let him take them out and carefully shake off all the soil from their roots and plant side by side in the open ground. Let him spread out in a large hole all the roots of one tree according to the inherited regulation method, and cut back all roots on the other to about one inch, at the top to one foot—just enough to allow of its being stuck down about six inches, like a cutting. Treat alike, and in two years the root-pruned tree will be many times larger than the other.

"And here I wish to say, very particularly, that the great superiority of close root pruning is not always so apparent the first year the tree giving more attention to striking deep roots than to making top. Even for several years, we all know, trees as ordinarily do well, but this is due to the fact that a large amount of roots removed even then.

"But a comparison with these will prove that when the strain

it bearing comes, the close pruned tree—with its roots deep and long, out of reach of the plough, winter's cold and summer's heat and drought—will stand up for many years, giving good crops longer than the other, with its lateral and surface system, has broken down and died.

"How else are we to account for the early decadence of our latter-day orchards? The planter in his haste for fruit demands big trees with plenty of roots and top, to support which, and to make them live, the nurseryman often transplants several times. This gives a mass of fibrous roots, which will undoubtedly—if the season is good—make the trees live, but practically dwarfs them and destroys their future usefulness. While Samson lost his strength through having his hair cut off, a tree is for ever weakened by leaving its 'hair' roots on when set, for it seems then compelled to re-establish itself by emitting new fibrous roots entirely from these. This results in a permanent lateral and surface system. Sink a spade round such a tree a year—or even two—after planting, and a slight pull will lift it from the ground; a short root-pruned tree will resist any effort.

"The whole theory of the latter method is simply copying Nature. She starts her tree from seed, with neither tops nor roots, and universal experience has shown that these and trees grown from cuttings (which are practically seed) if never moved are the strongest, healthiest, longest lived and most productive.

"The advantages I claim for this method—over the all-important one of giving better trees—are: First,

"AN ENORMOUS SAVING

to the nurseryman in digging his stock, which now must be taken up with roots a foot or more long. Second, an equally great saving in packing. Instead of great bales of tops, roots, moss, bagging and rope, and labour of putting up the same, or large boxes containing thousands of pounds of the same useless dead weight, a thousand root and top pruned trees could be packed in a medium-sized, tight box, with a layer of wet moss in the bottom to maintain a moist atmosphere, and shipped with perfect safety around the world.

"THE SAVING TO THE BUYER

will be even greater. As an instance, several years ago I ordered 1,000 grape vines from California, and wrote specific directions for root and top pruning as well as packing, and offered to pay for the extra pruning, the box to be sent by express. The nurseryman letting me down for a crank or fool, packed the vines—top, roots and all—in three immense bales weighing 1,300 lbs., for which he got a special rate, and yet they cost me £14 charges. I pruned and packed them in a single bale weighing 127lbs., and shipped them 50 miles, after which they were set by being simply stuck down into well pulverised ground and tramped, the whole operation taking out two days. Every vine grew, and next summer—the third year—I expect to ship grapes by the car load. It would be hard to estimate how many thousands of pounds are annually paid by planters to railroad companies in charges on worse than useless tops, roots and packing.

HUNDREDS OF POUNDS WILL BE SAVED IN THE PLANTING. Instead of large holes and spreading out of roots, and working in the soil by hand, as now practiced, the planter will prepare his ground, stretch a strong line with tags tied at the right intervals, make a small hole with a dibble a couple of inches in diameter, stick the trees down the proper distance, and when the row is done, turn back and tramp thoroughly. The tramping is very important. I will now repeat

"DIRECTIONS FOR ROOT PRUNING.

Hold the tree top down, and cut all roots back to about an inch, more or less, sloping the cut so that when the tree is set the cut surface is downwards. Experience has shown that these roots are generally emitted perpendicularly to the plane or surface of the cut. This final pruning should be done shortly before planting, so as to present a fresh surface for the callous to form. If trees are to be kept some time, or shipped by a nurseryman, about two inches of root should be left, the planter to cut back as directed when the tree is set. About a foot of top should be left. More or less makes no difference. If the tree is well staked, three feet may be left without diminishing the growth much. I have had six foot trees, well staked, to grow finely, but to avoid staking and to secure a new straight body it is best to cut back short.

"Let all shoots grow until a foot or so long, when the straightest and best should be left and all others rubbed off.

"I could give the experience and endorsement of quite a number of orchardists who have practiced this method with uniform success, but space will not allow me to mention but one. He stands on the topmost round of the horticultural ladder, and as far as I know is the only man whose mind is so unbiassed by the prejudice of preconceived opinions, and his perceptions so intuitively correct, that as soon as the method and reasons for it were presented, he saw its truth. Without waiting for the slow demonstration of experience, he at once put it in practice on his great 900-acre peach orchard of 100,000 trees, which he was about to plant in Georgia. I wrote him recently as to how it turned out. Here is the reply: 'Dear Sir, I am glad to state that the close root pruning, which was practiced when planting our entire orchard of one hundred thousand trees at Fort Valley, Georgia, proved to be the most successful operation we ever practiced, less than one-half of one per cent. of the trees failing to grow and all making the most vigorous and even growth I have ever seen in any orchard in America. The orchard is now three years' old, and gave us an enormous crop of fruit this past season. I am thoroughly in favour of this system of root pruning.—Yours very truly, J. H. Hale.'

"And now in conclusion, in view of the fact that my individual effort of eight years have amounted to practically nothing, the question is how to bring about in the general handling of trees this radical but needed reform. I see but two ways. The first through the medium of the nurseryman and his catalogue, and the second through the bulletins of the experimental stations.

"Quite a number of nurserymen are now practicing my method exclusively, and with perfect success, in all their nursery transplanting operations, but they dare not advise the people to adopt it for fear of being accused of trying to induce them to kill their trees, so as to sell them more next season. Mr. Hale is the only exception I know in the whole country who comes out boldly for close root pruning. Now let all the rest make mention of the subject in their future catalogues; next let the State experimental stations make exhaustive experiments on all kinds of trees, vines and small fruits, planting some with mere stubs of roots—a half-inch—and others with five, ten, fifteen and twenty inch lengths, setting enough of each to allow of taking up some every year to demonstrate at once that beyond a length of two or three inches the quantity and size of the new roots is invariably in an inverse ratio to the amount of old roots left on. The more and longer the old, the less, more lateral and weaker the new ones.

"Let them subject trees of different ages and length of tops to four or five years of the same treatment, and the result will be the same. The older close root pruned, even with four foot tops will, if staked, quickly re-establish themselves on strong, deep, new roots and make fine trees, while the same age long root ones will become permanently surface rooted and dwarfed for ever. No amount of fertilising or cultivation will ever make them catch up."

HILL TRAMWAYS.

THE Report of the Commission to report on Hill Tramways in Ceylon affords some interesting reading. Though we cannot spare the space for the whole report, the extracts below will give valuable information that may be of use in similar schemes in some of our districts in South India:—

TRAMWAY vs. RAILWAY.

Assuming as the definition of the former, a line having a grooved rail laid flush with the roadway, the Commission is of opinion that tramways are not suitable. The rail is a heavy and expensive one, and between the rails and on the outside of each rail paving stones or concrete would be necessary to maintain the evenness of the roadway and prevent a dangerous blocking of the groove. Apart, too, from the excessive cost involved by the use of a grooved rail, the Commission is of opinion that such rails are unsuited to the comparatively heavy, powerful engines required to work on the steep gradients and sharp curves which would prevail on all the lines.

NATURE OF THE ROAD IN THE HILL DISTRICTS.

Speaking generally, the Commission finds that the existing cart roads are not of a nature to be really serviceable as tracks for narrow-gauge railways. They abound in the sharpest of curves, and the gradients are so extremely steep, often for several miles on end, that, without deviations in the form of zig-zags, locomotives

working without racks could not pull an appreciable load behind them. Working under the most favourable conditions, a locomotive on a gradient of 1 in 20 (and there are many miles much steeper than that) would, in addition to itself, pull less than twice its own weight, and in unfavourable weather much less, so that, after allowing for the weight of the vehicles, the influence of curves, and a necessary margin to meet ordinary conditions, the actual net load moved would be small.

The Commission has not sufficient information before it to express a decided opinion on the suitability of rack railways to surmount the long steep inclines, but obviously they would be much more expensive in construction.

The laying of railways on the roads would to a great extent unsuit them for heavy traffic, and the witnesses have differed as to the importance to be attached to this, although upon the whole they inclined to view the boon of a railway as being worth the partial sacrifice of the roads.

The estate factories have all been built in relation to the existing cart roads, and were entirely fresh alignments selected for the railways, new approach roads would be required to enable the traffic to get to the railway. This, however, does not apply in the case of the Badulla scheme.

GAUGE OF THE HILL RAILWAYS.

The Commission's conclusion on this point unhesitatingly is that the gauge to be adopted should be that of 2 ft. 6 in., which affords great advantages over the narrower gauge in the matter of locomotive construction. It is true that in some cases, at all events, a 2 ft. gauge would be more economical and more easily suited to the sharp curves, but as the Kelani Valley line (if constructed) is to be on a 2 ft. 6 in. gauge (and probably a large section of the northern line), there can be no doubt that the general economy and convenience of adhering to one gauge for all the branch lines would far outweigh the saving which might be effected in some cases by adopting a narrower gauge.

RATES TO BE CHARGED FOR FREIGHT AND PASSENGERS.

At the earliest stage of the inquiry it was quite evident that if the rates for freight now ruling on the Nanu-oya extension were adopted for any of the schemes under consideration, the estimates would in all cases show a prohibitive loss on working. Nor is this to be wondered at: the volume of traffic to be dealt with on these feeder lines is naturally very much smaller and running a much shorter average distance than that of the trunk line, while the gradients to be surmounted are extremely adverse. It is obvious therefore that the cost both per train mile and per ton mile must be heavy. The Commission has taken as its basis of calculation the rates of cart hire ruling in the district from point to point, and all the witnesses and representative bodies have agreed that they are willing to pay these rates to the railway if constructed. The Commission recommends that such rates should be the ones charged until any line shows a substantial clear profit more than equal to the charges for interest and sinking fund. The Commission recommends that the passenger rates should be on the same scale as those levied on the Nanu-oya line, except in the case of the Nanu-oya-Nuwara Eliya section, where rather higher mileage rates should be charged.

PROSPECTS OF OBTAINING ALL THE EXISTING TRAFFIC.

Experience in connection with some of the Ceylon Railways has shown that it is not always safe to rely on existing traffic finding its way to the railway. Once a railway has been constructed and its manifold advantages secured beyond recall, the traffic which was promised and reckoned upon has sometimes only in part been given to the railway. The Commission therefore recommends that the Government should refuse to enter upon any scheme unless the owners of the estates interested are prepared to agree that all their traffic will be placed upon the railway (at rates agreed upon), and in order to give binding effect to the agreement, consent to the imposition of prohibitive road tolls on estate produce and supplies. It is gratifying to record that all the witnesses examined by the Commission readily recognized the fairness and desirability of such a precaution, and approved in their common interests of the proposal.

SKETCH ESTIMATE OF THE VARIOUS SCHEMES CONSIDERED BY THE COMMISSION.

Details.		Nuwara Eliya and Uda Pussellawa.
Acres in cultivation	...	Acres 9,877*
Estimated tea crop, 1897	...	lb. 2,200,000

Details.	Miles	Nuwara Eliya and Uda Pussellawa.
Mileage of suggested railway	...	18
Rough approximation of cost, including rolling stock	R	810,000
Interest and sinking fund at 4 per cent.	R	32,400
Cost of working	R	73,475

* Of this only 6,684 acres are in bearing, but as High Forest with 1,300 acres in cultivation, the traffic of which would come to the railway, is not included, the traffic as soon as the total acreage is in bearing will probably be quite 50 per cent. more than has been included in this estimate of receipts.

† Not the total acreage of the district, but only that which it is anticipated would use the railway.

‡ Of this only 23,348 in tea, and a large portion is not yet in bearing.

§ Not furnished by the District Planters' Association.

Annexure.

MEMORANDUM BY MR. P. A. MACKINTOSH.

Since the conclusion of the work of the Commission I have received from a well-known firm of Electrical Engineers in England, in reply to inquiries on my part, a list of electrical tramways or railways which they have equipped.

2. In this list there appears the case of the Bessbrook and Newry Railway, worked by electricity generated by water power through the medium of a turbine.

3. It has been in operation for 11½ years (although I had never heard of it, doubtless owing to its being such a short line), and it is claimed that it has throughout worked satisfactorily.* The predominant character of the traffic is goods or minerals.

4. Some of the details connected with it I subjoin:—

Length of line	... 3 miles 24 chains.
Steepest gradient	... 1 in 50.
Available fall of water	... 28 ft. [very little.]
Volume of flow of water per diem	... 3,000,000 gallons.
Average tonnage of goods carried annually	... 16,000 to 17,000 tons.
Average number of passengers carried annually	... 90,000 to 100,000.
Speed of trains	... 6 to 9 miles an hour.
Train mileage (in 1891)	... 21,468.
Cost of haulage per train mile, of which nearly 40 per cent. was for rental of water power (in 1891)	... 3·94d.

5. It is stated that, being an example of one of the earliest lines to be operated by water power, it is somewhat out of date, although it has operated successfully throughout; and certainly the cost of haulage seems to be extremely low.

This case at once suggests the possibility of working the Nanu-oya to Nuwara Eliya line through the medium of a turbine situated near Blackpool, utilizing the Nanu-oya in a similar manner, but with any improvements that may be possible. In the same way, for the line from Nuwara Eliya to Kandapola a generating station might be situated on the Kandapola-oya near Lover's Leap, while the section from Kandapola to Ragalla might possibly be treated in a similar manner from the adjoining stream, the capacity of which is not, however, so confident about.

I think the matter is worth the serious consideration of the Government, and if they desire it, I will, during the progress of the survey now being begun between Nanu-oya and Ragalla, have systematic gaugings of the three streams referred to taken before the rains set in, and levels taken to ascertain the available head of water.

a view to obtaining estimates, on the completion of the survey of the equipment of the line for being worked by electrical power generated by water power.

P. ARTHUR MACKINTOSH.

SAWELLA, March 30th, 1897.

MEMORANDUM BY THE HON. MR. T. N. CHRISTIE.

Although I do not think that a slow speed train ascending steep gradients round sharp curves at all lends itself to electrical propulsion, I concur in thinking that the water in the streams should be harnessed, and if it occasions no undue delay, the question of the feasibility and cost of the scheme reported upon.

It must be borne in mind that the system of having a driver for each vehicle would not suit Ceylon conditions. No vehicle could be expected to descend the gradients of the Nuwara Eliya line unless it was under the control of a driver of the same standing as the drivers on our existing line; and were one such required for each vehicle, the cost would be great. A system in which every vehicle, or almost every vehicle, had its own motor and yet the whole train was under the complete control of one driver, would I think be essential.

March 31st, 1897.

THOS. NORTH CHRISTIE.

STRAY JOTTINGS.

ONCE had a boy who was always drinking my whiskey. I tried again and again to catch him but without success. The last one morning he thought I had gone out, whilst as a matter of fact I was writing in the office, the doors of which opened off the dining room. I heard him moving about there and stop opposite the sideboard. I heard a bottle uncorked and the gurgle of something passing down somebody's throat. I quietly opened the door and found him with a pleased smile on his face, the whisky bottle in one hand, the cork in the other. "Boy," I said, "I've caught you at last stealing the whiskey." "What, Sar," said he, "I never steal, master left the cork out of the bottle last night, I put it back now," and with that he hammered the cork home with an indignant thump. I was so amused that I let the impudent scamp off.

How few planters try to understand their coolies. It is difficult enough, Heaven knows, and as an old friend of mine says, "the longer you live amongst them, the more you understand your ignorance of their ways." Yet I am sure that it pays to try to understand them. First learn to talk their language well so that there may be no possibility of mistakes arising; then try and learn their castes, for though castes cannot as a rule be recognised officially on the estate, a lot of friction may be saved by understanding them. Never tell a cooly a lie, if you value your reputation with them. Never nag at them, or they will leave you; treat them as children; give strict justice and no favour, and though you will be feared by evildoers, you will have public opinion with you. Never strike a cooly unless he really deserves it, but if you do, give him one licking that he won't forget and then treat him as forgiven; no nagging afterwards. Learn their proverbs—they are very clever—and their language well. A man who can chaff them will have little trouble with them, for they like yet fear chaff. And always be straight with them. Never forget yourself and that you are an English gentleman, and they will understand and respect you for it. For no one can tell "the pukka sahib" from the "kutchu" one quicker or more truly than the despised Tamil cooly; and finally do not be discontented with your Tamil and South Indian labour too quickly. I have worked with Tamils, Sinhalese, Malays, Javanese, Chinese, Kashmiris and E. Africans

of various tribes, and unhesitatingly say Tamils are best, from Madura for preference, next Javanese and Malays; then Sinhalese and Chinese, and worst of all Kashmiris and East Africans, and worse than that I don't want.

I AM told that hunting up in your lovely Neilgherry hills, if you start a sambur with your dogs on your own land and it cross your boundary before you have bagged it, you must whip off, as it would be trespass to follow and kill it on a neighbour's land. In Ceylon they have a capital unwritten rule there. If you start a stag on your ground, you may follow and kill it where you can; and if your neighbour starts a stag on his land and his hounds run into it on yours, he may follow and kill it there; but he may not start his hunt on your land and you may not start hunting on his, and if you have followed and killed your stag on his land, you must of course couple up at once and get back without doing any damage, and it is only courtesy if you are successful to send him a haunch of the venison. It may be a small thing, but these small courtesies knit the planters close together. To start hunting over your border without permission would be a gross breach of etiquette.

I NOTICE up here that most men screw their corrugated iron roofs down fast to the reepers. This does not allow for contraction and expansion of the iron and the screw holes where worn. There is a better plan than this in which no screws are used, only corrugated iron clips "S" shaped. Begin at the eaves, and over the lowest reeper fix one of the clips and into the part of the "S" clip which turns up lay the sheet of iron, finish the row, then move up to the next row, the top part of the "S" clip goes over the reeper and the lower sheet of iron, and the lower part again holds the upper layer of iron sheeting, and so on to the top of the store or other building; the ridging will need in windy districts to be screwed down. The clips should be of stout galvanised iron and 1½ inches wide; they can be got from Messrs. Walker & Co., Engineers in Kandy, Ceylon, and doubtless elsewhere. Corrugated sheet iron treated in this way is absolutely as good as new after years of wear, for the clip allows a certain amount of space for the contraction and expansion of the iron sheeting and it allows space for wind to pass through. I have known a store with the iron sheets screwed down the roof taken bodily off in a storm, but with ten clips through, the roof may rattle a lot in a gale. It won't blow off, and if you want to sell in old roofing, it commands a lot better price. Why does not some enterprising man start rickshaws and carriages for hire in Coonoor? I hunted high and low the other day for something to take me out to an estate. A rickshaw was an unknown quantity, few people knew what I meant, and when I suggested *jin*-rickshaw, I was told the way to the nearest bar, and that, barring jokes, I thought rough on this child. A carriage was not to be had, and finally I got a torture box called a bullock dandy, I think at Rs. 1-4-0 a mile, with a pair of the slowest "mads" I had ever sat behind; they did about a mile and a half per hour and the driver lost his way, and I was so comfortable that I nearly died of exhaustion before I got there.

WHY is it that the married ladies out here are generally the best looking? Is it that the good-looking ones

are all snapped up, and the others are the balance that have failed at home and have come out to live with brothers and married sisters to try, try, try again? I do not say that this is always the case, but can any one suggest a more likely reason? I have worried over it a long time, but cannot make up my mind.

HAS any one ever tried distillery scent from cinchona blossom? I have had some from coffee blossom. It was most delicious, but of course it did not pay to use coffee blossom for scent; that which I was given was a tin phial made by way of experiment, but cinchona blossom is also very sweet, and instead of rendering the plant valueless, improves it. Succirubra blossom would do as well as officinalis.

HAVE you ever heard of John Jones' dog "Tim?" No! well perhaps not. "Tim" was a mighty clever dog, there was nothing he could not do, his master avowed, but speak and read and write. One evening old John had been reading aloud to his family about a flying machine, with "Tim" lying listening on the hearth rug. And next morning when John went out, I'm blessed if he did not find that dog trying to make the tame peacock that lived round the house take him for a fly.

IN opening a new estate. After first selecting the site for the store, next select the site for the bungalow. This should be close to the store but not too close, about 150—300 yards away is best. When you have selected the site, peg it out and put in the roads and paths, and then before you do anything else plant fruit trees round it. How few men do this. They say, "Oh! what's the good? I shall never see them fruit," and the consequence is very few bungalows have good fruit trees round them. The expense is trifling. Rs. 50 the first year and Rs. 10 a year afterwards will go far towards making the place lovely and giving you plenty of wholesome fruit. I would suggest at this elevation (1) Tree Tomato, (2) Pear, (3) Plum, (4) Apple, (5) Papaya, (6) Grenadilla, (7) Loquat, (8) Passion Fruit, (9) Mulberries and the hardier oranges and mangoes. It will do no harm if fruit trees are planted round the coolie lines also. It will hide them a bit, and coolies like fruit as much as we do. The trees also add to the value of an estate. Neatness and a comfortable home look will put 10% or more on the price of the place very often.

HAVE you never seen a little bird a-sitting on a tree?
Have you never seen a planter agoing on a spree?
Have you never seen a civil servant over ears in debt?
Have you never seen a soldier who was ready for a bet?
Have you never seen a lady who wore someone else's hair?
Have you never seen a nigger who thought that he was fair?
Have you ne'er seen a grass widow with a husband in the plains?
Have you ne'er seen a hill station where it never never rains?
Have you never seen a spinster who liked to have her fun?
Well! you had only to go to Ooty and you'll see there everyone.

X. Y. Z.

HAVE you ever heard your nickname? No! yet probab-

ly you have one. Natives are very fond of nicknaming their masters; but it is seldom you hear your own name, though you may know your neighbours'. I give you half a dozen, and very smart they are: (i) "*Whisk Soda Durai*" or "*Peg Durai*" needs no explaining. (ii) "*Nerupoo Durai*" a very red-faced man. (iii) "*The Bashaw*" a high-handed master. (iv) "*The Stork*," a tall man with hooked nose. (v) "*Canaddy Durai*," a man with glasses. (vi) "*The Goat*," a man with a heavy nose and fair hair, whiskers or moustache and a tuft of beard on his chin. (vii) "*Bwana Simba*," the lion bwana (master), a big burly man with a red beard. (viii) "*Bwana Chai*," the leopard master, an active watchful man. (ix) "*The Needle*," a very thin man with sloping shoulders, colorless hair and eyebrows and a big mouth. (x) "*The Owl*," a small man with a bulbous head, big eyes, usually wore a big beard and moustache; appeared without them one day and his hair cut very short and was named at once. And I will end with a couple of rather clear English ones. (i) *He* was called "*Brown Windsor*," for his name was Windsor and he was very brown and he never used soap. (ii) *She* was young and very pretty and was called "*Pears' Soap*" because, like the baby, *she* was never happy till she got it.

Bye products.—

A capital oil can be expressed from tea seed. It is bitter. Burns well, and if applied to wood has the property of making to a great extent not proof.

Prunings, managras, etc., damped and pressed make very good fuel, burning with a very fierce flame.

Odds and ends of cinchona shavings can be boiled down to an extract, which is almost if not quite as good an antidote against fever as the white sulphate of quinine crystals. It will contain quinine, quinidine, cinconine and chinconidine.

Have you ever heard of tea made of coffee leaves? It is made the same way as tea. The young leaves are picked, withered, rolled, fermented, and fired, and they say it tastes well and contains caffeine instead of theine.

LETTERS TO THE EDITOR.

RECIPES WANTED.

SIR,—I would be much obliged if some of your correspondents would kindly give me recipes for the following:—Fish Moulé (Pillau). Kedgerree. I would also like a recipe for a good curry powder and mango chutney.

DURBAN.

Yours truly,
ANGLO-INDIAN

TAMIL GOOSE AND BENGAL GANDER.

SIR,—From the reply of the Government of India to the Ceylon Government in reference to recruiting labour from famine districts for the Ceylon estates, it is very plain that the Indian Government has no wish to promote emigration, and the event of recruiting for Ceylon being carried out, it would not be done before special legislation to protect the emigrants had been passed. To the unprejudiced on-looker it would seem that if a special law is required for the Bengal coolies the Madras Government has been highly culpable in allowing free labour traffic to go on for years, and as the Government of India has known of the traffic, it must clearly be convicted as an accessory to the fact.

An explanation as to why the Bengal gander needs served up with a different sauce to the Tamil goose would be inter-

g, but we do not suppose it will be forthcoming. The letter is signed by Mr. Denzil Ibbetson, C. S., C.S.I., Secretary to the Government of India, and from his allusion to "Coffee Estates," is evident that his knowledge of Ceylon is of antiquated character, probably derived from an out-of-date Directory, and leads to suggest that that gentleman's education would not suffer by undergoing a course of up-to-date commercial geography.

ANON.

HOUSE-KEEPING FOR BACHELORS.

SIR,—I was very glad to read "Planter's Wife's" notes on housekeeping for bachelors as it will be a help to many. I am not a bachelor myself, but keeping house for one, and his pay is only a little more than the sum mentioned. So we have to be careful in everything to be able to make ends meet.

"Planter's Wife" leaves out the important item of liquor, and is important in planting districts. Even if the master of the house takes very little, the men who look in as they are dining by (and we have a good many) all expect a peg. I don't mean that we grudge it, but it all tells. Tea is not a favourite beverage with them. I think 12 Rs. a month quite enough for a general servant, though a lady here is giving her cook 20 Rs. a month. My "general" bakes bread every other day in addition to his other work, and makes it very well too. Not with baking powder, but plantain yeast after Mrs. E. B. Watson's recipe (Messrs. Traill and Co., 20 British India Street, Calcutta), and we never run short of bread in consequence.

Tomatoe Sauce.—I send an easy recipe for making a delicious sauce for tomatoe salad. Choose well-shaped ones. Peel carefully, slice and lay in a dish. Into a bowl put a dessert spoon of sugar, one of vinegar, one teaspoon of oil, pepper and salt. Pour on a dessertspoon of cream and two of milk, mix well and leave till wanted. If the morning's butter milk is sweet, use instead of milk and cream.

Pastry Board.—I know from experience the trouble one has to get a suitable place to make pastry on. Small tables are often not steady on their legs and rock about in an aggravating way, and slabs often crack or shrink at the joints. So in despair I bought a yard of white American leather and nailed it firmly on to the lid of a large store box in a cool back verandah, and have been very well satisfied with the result. You have plenty of room and everything at hand. After use, the leather is well washed with warm milk and water, dried and covered with a newspaper.

NIECE.

AMERICAN MARKET FUND.

ALL PROPRIETORS AND AGENTS OF TEA GARDENS.

DEAR SIRS,—The General Committee have recently circulated to all members and branches of the Association, as well as to the various Planters' Associations with whom they are in correspondence, copies of the last Interim Report of the American and Foreign Tea Committee, in connection with the London Branch of the Association. This Report, which is dated 23rd February 1897, gives in a brief and concise form the results of the operations which have been carried on in America, during the past year, by Mr. Blechynden, the Association's representative, in conjunction with Mr. Mackenzie, representing Ceylon, with the purpose of bringing the teas of both India and Ceylon to the notice of the American public. The London Committee are satisfied that everything possible is being done to awaken interest in British-grown teas, and the General Committee agree with the Committee in London that Mr. Blechynden's Report on his work for 1896, which was circulated with the Report of the American and Foreign Tea Committee in London, affords strong evidence of the value of the work done, and of the necessity of continuing the campaign. Mr. Blechynden's versatility in striking out new modes of attracting attention to

British-grown teas and also in adopting constantly changing styles of advertisement deserves, in the opinion of the General Committee, every commendation, and the results of his own and Mr. Mackenzie's energy are very strikingly shown in the following table of statistics, showing the progress made in the use of Indian and Ceylon teas in North America during the last six years. These figures have been carefully revised by Messrs. Gow, Wilson and Stanton, and may be taken as approximately correct:—

INDIAN AND CEYLON TEA TAKEN BY NORTH AMERICA DURING EACH OF THE LAST SIX YEARS.

	1896.	1895.	1894.	1893.	1892.	1891.
Indian...	5,205,405	4,059,595	2,428,230	2,111,247	1,586,426	1,342,321 lbs.
Ceylon...	4,268,614	3,735,590	2,295,140	1,870,590	1,489,474	991,981 lbs.
Total lbs.	9,474,019	7,792,185	4,723,370	3,981,837	3,075,900	2,334,302 lbs.

With these figures before them, and also bearing in mind that the present year's crop from both India and Ceylon is likely again to show a substantial increase, the General Committee fully agree with the Committee in London that there should be no relaxation made at present in the effort to win the American Market, and they have consequently instructed me again to ask you for further contributions from Gardens under your Agency, on the same basis as last year, viz., at the rate of four annas per acre on the area under cultivation, and half an anna per maund on the production. The amount subscribed in response to my Circular No. 164—O., of 22nd April 1896, was Rs. 1,03,674-8 as., as against Rs. 92,575 collected in 1895. This included as in the previous year liberal contributions from the two Planters' Associations in the Travancore district.

The Committee trust that the amount forthcoming this year may not at any rate be less than what was contributed in 1896, and they hope that those who have hitherto held aloof will realise the importance of now contributing for the general interest and advantage. They will also be glad if the support now asked for could be intimated to me not later than the 15th June on the annexed form.

"INDIAN TEA ASSOCIATION." }
ROYAL EXCHANGE BUILDING, }
CALCUTTA, 15th April 1897. }

Yours faithfully,
W. PARSONS,
Secretary.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric acid.

Orders booked for the coming crop of seed from the parent trees of above analysis at Rs. 3 per 1,000.

Manager, ARIENKOW ESTATE,
SHENCOTTAH,
Tinnevely.

COFFEE.

We learn that a marked effect of *E. lithosperma* on coffee grown under its shade is shown in the increasing weight of the bean. We are informed of an instance where, previous to shading, it took 6.25 bushels to the cwt. Since the establishment of shade, a gradual improvement has taken place. Last year it took just five bushels, and this year it has gone down to 4.67 bushels to

the cwt. "I don't think," says our informant, "it possible to produce stronger evidence in its favour. There is nothing theoretical about this."

Improved seed.

Mr. L. W. Grey, of Pykara, Nilgiris, has sent us the following table of comparative analyses of various samples of seed we forwarded him from Mysore and elsewhere, and invites comment thereon:—

ANALYSIS OF COFFEE SEED.

District.	Moisture.	Soluble with parchment.	Ash without parchment.
Nellacotta ...	11.257	2.744	2.098
Coonoor ...	11.691	2.192	2.674
Coorg & Mysore ...	11.872	2.908	2.880
My seed ...	3%	7%	3.71

The analyses were made by Surg.-Major vanGeyzel, of Madras.

There is without doubt a very great difference between Mr. Grey's seed and the others. The greatest difference lies in the moisture column. The drier the seed, the higher the percentage of other constituents, be they soluble or insoluble ash, or anything else. As they stand we cannot say the comparative analyses are at all conclusive. For were each sample of the same degree of dryness, the differences now existing in the last column, *i.e.*, ash without parchment, would, *probably*, be largely done away with.

The question is obviously one for practical experiment, for without a very searching comparative analysis, little can be held to have been proved one way or the other. Mr. Grey must not be discouraged by our critical remarks. May they on the contrary spur him on to fresh investigations in the extremely interesting and valuable line of research he has taken up.

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.

(SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA, TO MESSRS. MATHESON AND Co.)

[Reprinted from the "Madras Mail" by the kind permission of the Editor.]

(Concluded from our last.)

Chief needs.

From the preceding data and analysis it would appear as if the chief requirements of the coffee tree are phosphoric acid and nitrogen; unless the surface soil has been lost, there would appear to be but a small demand for potash. Potash salts are very soluble in water, and appear to be easily assimilated by the plant. These are abundantly supplied by the slow decomposition of the feldspar and mica schist in the rocks, and the stray matter of the soils, together with lime and magnesia; but the accumulation of the salts in the land is prevented by the monsoon rains. If they are required, as in analysis C. above, the best thing would be the use of ferns for bedding cattle, particularly bracken, where such are procurable. The ash of the bracken fern, according to Lester Arnold confirmed by John Hughes, contains potash 42 per cent. and phosphoric acid 10 per cent., and is a very valuable manure wherever potash is required, and will well repay the trouble of collecting the fern. Should ferns be unprocurable and the addition of a potash salt necessary, the best thing would be kanite. The buyer should stipulate for

25 per cent. sulphate of potash at the very least. But potash is not necessary as a rule, and should never be used in excessive quantities, as it increases the quantity of pulp at the expense of the bean. This, however, does not apply to nitrate of potash which acts more like ammonia sulphate than anything else. Wherever there is plenty of nitrogen in the soil, the leaves of the trees are large and of a beautiful glossy green, but the bean is small unless there is a fair share of phosphates present also. This leads to the conclusion that the coffee tree must have nitrogen and phosphates in the manure. Whether potash should be included or not depends greatly on the nature of the soil. For instance, it would be unnecessary with a retentive soil like B. above. With some soils the analyses show a weak spot at once, and we can easily select a single manure to meet the exigencies of the case; in others the manure must be diffusive to cover the whole range of the necessities of the plant and the poverty of the soil.

The following represents a good type of a complete manure of a diffusive manure:—

- 1 cwt. Fine bone meal.
- 1 " Pure fish.
- 1 " Superphosphate of lime 40 p. ct. soluble.
- $\frac{1}{2}$ " Sulphate ammonia.
- $\frac{1}{2}$ " Kanite 25 per cent. potash sulphate.

This applied after the heavy rains are over, at the end of July or in August, will supply plant food in a form immediately available for the plant's requirements, and will greatly assist in the perfect development of a healthy bean. It is stimulating, but holds the plant food in varying degrees of preparedness ready for the use of the plant from season to season; 4 cwt. per acre mixed with 1 cubic yard of burnt earth or two good loads of cattle manure is sufficient for one acre per annum. It is well suited to the raising of supplies.

In conclusion, attention should be paid to the advantages of green manuring.

Nitrogen is a most expensive item in manures, but certain plants readily take it up from the air in some way little understood at present. Lucerne, clover, mustard, &c., may all be planted under the coffee; they are excellent manures, as they derive most of their nitrogen from the air and send their roots deep into the ground in search of food. The growth of white mustard is so rapid that it may be used to choke out other weeds by sowing two or three crops in succession and fork them in. Green manuring, if carefully carried out, should supply all the necessary feed for the bullocks used on the estate and protect the soil from the action of the sun during the dry weather. This system of cultivation is specially suited to poor soils such as shown in the analysis C. above. It will also improve the condition of heavy and retentive lands. If put to force, the land should be limed once in three years or so, and the plants should be grown in rotation. In this way it will be possible to clean the land and free it from an excess of injurious salts. The coffee tree is wanted as a permanency, and the best way of keeping the land healthy is to grow a rotation of annuals under the coffee, and as far as possible a rotation or diversity of shade over it. Whenever a shade tree shows signs of becoming a surface feeder, it should be rooted out; slow growing shade should be put in to take the place of the quick grown shade if it dies off. By these measures it will be possible to prevent the land in a great measure from becoming coffee sick, which it does by becoming infested with microscopic fungi and bacteria when kept under one crop too long. The investigations into potato and vine diseases and clover sickness show this to be the main cause of land refusing to bear on crops of continued succession. It is from this cause that the great number of coffee supply plants fail, while mealy-bug assists in the devastation. All these pests can be eradicated by proper treatment at the right season.

II.

COFFEE BLOSSOM.

A more beautiful sight than a good field of coffee out in full blossom is seldom seen. Overhead there are the varied greens of the foliage of the shade trees, while the coffee looks as if covered with snow, only a few green leaves showing up here and there. The change is almost startling in its suddenness. What was a field of dark, glossy green in the evening is in the use of good coffee, where all the blossom comes out together, changed in the course of a single night to a sheet of pure white; this condition lasts two or three days, when the blossom fades and in a week the coffee has resumed its ordinary glossy dark green appearance. While the blossom is out, the perfume is so strong that with the wind blowing over the estate it can be felt quite half a mile off. When not too strong the smell is very pleasant, but where a whole field is out in full bloom, on passing through it the effect is anything but agreeable. The odour is so intense as to be quite sickening to bilious people, while with others it induces an attack of fever. It, however, contains the promise of a good crop, and it only lasts two or three days. In South Coorg three good shows of blossom in one season on any one estate are most unusual; and the planter, to whom a good blossom well set means a comfortable balance at the banker's, is by no means unwilling to put up with this temporary inconvenience even if it does bring on fever. The appearance of the blossom is the most anxious period of the year; should the rains fall, the blossom may prove abortive. A touch of rain is generally sufficient to give a good blossom, but a great deal depends on the condition of the soil and the trees. I have seen a good blossom from as little as half an inch of rain. Where the cultivation is superficial, a quarter of an inch may start the blossom, and unless more rain brings it on, it is apt to be partially open, and in this condition is often shrivelled up by the sun. Should rain fall heavily within twenty-four hours of the appearance of the blossom, the effect is apt to be very disastrous. Whether it acts by washing off the pollen, or by hastening decay so that insects have not time to fertilise it, or by knocking off the blossom altogether, it is an important factor as regards the production of the seed. And the planter who sees his blossom set nicely without having rain on it has a great weight taken off his mind. He is, however, still anxious as more rain is in general required to bring it on. His crop prospects depend to a very large extent on these early rains. Even under the most favourable circumstances a very large percentage does not set. If all came on, and the trees could ripen the berries, the crop might be estimated by tons, not cwt., per acre. With six by six feet coffee, twelve hundred trees per acre, about 140 berries on an average per tree, will give 1 cwt. per acre. An average cluster of flowers is from ten to fifteen, and there are often on a good branch twelve to twenty clusters. Taking the lower of these numbers, and supposing all the trees to be of equal growth, and that there are only sixteen bearing branches per tree, we have $\frac{10 \times 12 \times 16}{140} = \frac{92}{14}$, or 13 cwt. 2 qrs. and 24 lbs.

Yet a good average crop for the district is from 4 to 6 cwt. per acre. Exceptional estates in exceptional seasons have given more than double these results. Blanks and want of cultivation will probably account for much of this deficit. Exceptional seasons show that a great deal depends on the weather, but where the weather is most favourable, there is still a large deficit. The influence of inopportune rain is seen in a patchy blossom. Where this occurs the loss is very great.

Speaking of the failure of the blossom to set, Hull remarks: "This is most commonly the result of inopportune rain while the flowers are out; or it may follow a prolonged season of drought and be due to a weakly condition of the plant." Granted; but why do the trees, when all the conditions are

favourable, not yield a crop proportionate to the blossom that came out? This subject has commanded my attention for the last five blossoms in South Coorg, all of which I have seen, and in no case has the crop been equal to the show of flowers. Then again, one of the most surprising and perplexing results of my experiments was the fact that the unmanured plots were superior to the manured estate, and not much inferior to the manured plots. The question was evidently one of nutrition, and I was forced to the conclusion that the season at which the manures were applied had a most marked effect on the yield of crop. A study of the effect of nitrogen on plants throws much light on the subject, and I may, therefore, quote from the Bulletin of the New York Agricultural Experimental Station the following:—

"The influence of nitrogen in its various forms upon plant growth is shown by at least three striking effects. First, the growth of the stems and leaves is greatly promoted, whilst that of buds and flowers is retarded. Ordinarily most plants, at a certain period of growth, cease to produce new branches and foliage, or to increase those already formed and commence to produce flowers and fruits, whereby the species may be perpetuated. If a plant is provided with as much available nitrogen as it can use just at the time it begins to flower, the formation of flowers may be checked, while the activity of growth is transferred back to and renewed in stems and leaves which take on a new vigour and multiply with remarkable luxuriance. Should flowers be produced under these circumstances, they are sterile and produce no seed. Second, it deepens the colour of the foliage, which is a sign of increased vegetable activity and health. Third, the relative proportion of nitrogen in the plant is increased in a marked degree."

Now, it is evident if the foregoing is true, and it is supported by the evidence of the first agricultural scientists of the day, the question of the supply of nitrogen to the coffee plant is of the greatest practical importance to the planter. The tree must have nitrogen, especially where leaf disease is virulent, but there must not be an excess when the plant blossoms, or the blossom will not set. (Here is a hint for tea planters. When your plants will blossom and run to seed, apply nitrogenous manures at once; the soluble forms will be most useful, such as potash nitrate, or Chili saltpetre, or ammonia sulphate.) The coffee planter wishes his plants to seed and, as a rule, the tea planter does not, so the rule of manuring must be inverse. It is evident that in South Coorg if a nitrogenous manure is applied just after crop it will be brought into action by the showers that start the blossom, and this is enforced by the fact that manuring in August and September gives better results, and that the plots with no manure yield better than the estates manured just after crop. Not only must the time at which the manure is applied be carefully regulated, but the quantity also. We have seen that an excess of nitrogen was fatal to supplies; we now see that it is equally fatal to the blossom when it is applied at the wrong time. In South Coorg, the first break after the burst of the S. W. Monsoon, as I have previously pointed out, is the best time to manure, especially where the soil is rich in nitrogen or nitrogenous manures are used. Where the trees are in full vigour while the crop is ripening up, and a good show of wood is there for the next crop, so long as the trees are not overpruned so as to force an excess of sap into the remaining branches, a healthy spike will be developed and a good blossom got with moderate rain, which on well cultivated land that has been judiciously manured will set well. Injudicious manuring, excessive pruning, and want of systematic handling are undoubtedly as much the cause of blossom failure as any freaks of the weather; and they are controllable where there is a capital and labour, while the weather is not. In my opinion the greater number of failures of blossom to set are traceable to preventible causes. Of course, a hail-storm on the blossom is fatal and beyond the best planter's skill to control. A heavy thunderstorm is almost as bad, but a gentle drizzle does not appear to do much harm, nor do heavy dews. A good shower just after the blossom has set will give the young buds a good

start, and if the land is in good heart, and the trees also, there will be little fear of the berries dropping off.

The proportionate fertility of the coffee blossom in South Coorg is coincident with the appearance of a greater or less number of bees. In 1887 bees were very numerous and the crop good; in 1888 trees were not so many; in 1889 there were fewer still; in 1890 the absence of the usual swarms was marked, and the crop a miserable one; in 1891 they were almost as numerous as in 1887, and by the last accounts the crop is going to be up to the average. After studying Darwin and Lubbock and Pasteur, I have no doubt but that the bees and the other insects play an important part in the fertilisation of the blossom. I have watched the bees passing from flower to flower covered with pollen, and they appeared quite capable of carrying on the fertilisation of the plant. However, a plot of Liberian intermixed with Arabian has been planted, and if a cross is obtained from them before the branches touch, I would be inclined to consider that, taken in conjunction with other evidence as a proof—if the cross was general—that the insects had been instrumental in causing it. Several of the Coorg planters have confirmed me in my observations of the number of bees being proportionate to the fertility of the blossom. Now if nature provides the bees, it is the planter's duty in his own interest to provide them with a healthy blossom to fertilise. If the blossom is healthy, the powerful odour, which in excess is so unpleasant to us, will be wafted to a great distance and will serve to attract the bees, to whom it tells of acres of sweets. I mentioned at the beginning that the odour was on a good field so strong as to produce sick headache and feverish symptoms, and I have noticed that it was where these symptoms were most intense the blossom generally set well. Judging from this, the strength of the perfume is characteristic of a healthy state of the flowers and attracts a greater number of bees than when it is weak, so that the work of fertilisation is more actively carried on, and there is a greater probability of the coffee blossom being equally fertilised. Hence we may conclude that a good healthy blossom is a strong smelling one, the smell being intended by Nature to attract the bees and other insects necessary to the fertilisation of the blossom and the production of the seed.

TEA.

Lipton and Ceylon.

We learn from the *Ceylon Over-land Observer* that the great Mr. Lipton has just finished a visit to Ceylon. Most of his time was spent in visiting his numerous estates. In questioning him about Ceylon prices, are they to continue to go lower, he thinks it entirely depends on quality; if men will try for quantity, instead of quality, prices will probably drop, but if planters will attend more to quantity without going to the extreme of very fine picking, prices will improve with little or no loss of quantity.

He advises Ceylon men to stick to their ground in America, Russia and Germany, and try and push their teas there still further. He thinks that nothing is to be feared from China soon, when their teas are machine made.

And above all, his advice is "Advertise," and Indian Planters might well follow his advice.

London Market.

The quantity brought forward has been comparatively small, and prices, says the *Produce Market Review*, especially for the common grades, have shown an irregular tendency. The supply now includes a considerable proportion of the lower descriptions, which in many cases are poor in cup, especially the

Calcutta bought teas, which could only be sold at low rates. As much of the tea to come forward will consist of these kinds, current rates will hardly be maintained until there is a distinct improvement in the demand. The supply of the better sorts, although not large, is sufficient, and brought about previous prices, and these rates will probably be maintained as the quantity to arrive is not likely to prove excessive. For the finer descriptions the market is somewhat irregular, but the changes were not important. The more desirable lots fetched quite former rates, while the thin liquoring teas showed a declining tendency. The figures for the past month, as compared with March of last year, are fairly satisfactory. Imports were nearly 1,500,000 lbs. larger, or 7,059,000 lbs. against 5,619,000 lbs., and the deliveries have increased 800,000 lbs., the figures being 11,194,000 lbs. and 10,380,000 lbs. respectively, the increase showing the large increase of 5,500,000 lbs. At the present sales only 19,624 packages were catalogued, 2,619 being withdrawn. For the "last of the season's" crop of the Assam Company's growth there was active bidding, and prices were firmer than for those sold in the previous season, while as the majority of the more popular gardens have disposed of the past season's produce, the market probably continue firm for all the better grades.

THE NEW AMERICAN TEA LAW.

THE following is the full text of the new law to prohibit the importation of impure and unwholesome tea:—

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

Section 1.—That from and after May 1, 1897, it shall be unlawful for any person or persons or corporation to import or bring into the United States any merchandise as tea which is inferior in purity, quality and fitness for consumption to the standards provided in Section 3 of this Act, and the importation of all such merchandise is hereby prohibited.

Section 2.—That immediately after the passage of this Act, on or before February 15th of each year thereafter, the Secretary of the Treasury shall appoint a board, to consist of seven members, each of whom shall be an expert in teas and who shall prepare and submit to him standard samples of teas; that the persons so appointed shall be at all times subject to removal by the said Secretary; that the board shall serve for the term of one year; that vacancies in the said board occurring by removal, death, resignation, or any other cause shall be forthwith filled by the Secretary of the Treasury by appointing such appointee to hold for the unexpired term; that said board shall appoint a presiding officer, who shall be the medium of all communications to and from such board; that each member of said board shall receive as compensation the sum of fifty dollars per annum, together with all necessary expenses while engaged upon the duties herein provided, shall be paid out of the appropriation for "expenses of collecting the revenue from customs."

Section 3.—That the Secretary of the Treasury, upon the recommendation of the said board, shall fix and establish uniform standards of purity, quality and fitness for consumption of all kinds of teas imported into the United States, and shall procure and deposit in the custom houses of the ports of New York, Chicago, San Francisco, and such other parts as he may determine, duplicate samples of such standards; that said Secretary shall procure a sufficient number of other duplicate samples of such standards to be sent to the importers and dealers in tea at all ports desiring the same, at the cost of the importer. All teas, or merchandise described as tea, of inferior quality and fitness for consumption to such standards shall be deemed within the prohibition of the first section hereof.

Section 4.—That on making entry at the custom-house of any tea or merchandise described as tea, imported into the United States, the importer or consignee shall give bond to the collector of the port that such merchandise shall not be removed from the warehouse until released by the collector, after it shall have been duly examined.

reference to its purity, quality and fitness for consumption; for the purpose of such examination samples of each line in every invoice of tea shall be submitted by the importer or consignee to the examiner, together with the sworn statement of such importer or consignee that such samples represent the true quality of the tea and every part of the invoice and accord with the specifications therein contained; or in the discretion of the Secretary of the Treasury, such samples shall be obtained by the examiner and compared by him with the standards established by this Act; and in cases where said tea, or merchandise described as tea, is entered at a port where there is no qualified examiner, as provided in Section 7, the importer or consignee shall in the manner aforesaid furnish, under oath, a sample of each line of tea to the collector or other revenue officer to whom is committed the collection of duties, and the collector or officer shall also draw or cause to be drawn samples of each line in every invoice and shall forward the same to a duly qualified examiner as provided in section 7; *Provided, however*, that the bond above required shall also be conditioned for the payment of all custom-house charges which may attach to such merchandise prior to its being released or destroyed (as the case may be) under the provisions of this Act.

Section 5.—That if, after an examination as provided in Section 4, the tea is found by the examiner to be equal in purity, quality, and fitness for consumption to the standards hereinbefore provided, and no re-examination shall be demanded by the collector as provided in Section 6, a permit shall at once be granted to the importer or consignee declaring the tea free from the control of the custom authorities, but if on examination such tea or merchandise described as tea is found, in the opinion of the examiner, to be inferior in purity, quality and fitness for consumption to the said standards, the importer or consignee shall be immediately notified, and the tea, or merchandise described as tea, shall not be released by the custom-house, unless on a re-examination called for by the importer or consignee the finding of the examiner shall be found to be erroneous: *Provided*, That should a portion of the invoice be passed by the examiner, a permit shall be granted for that portion and the remainder held for further examination, as provided in Section 6.

Section 6.—That in case the collector, importer or consignee shall protest against the finding of the examiner, the matter in dispute shall be referred for decision to a board of three United States general appraisers, to be designated by the Secretary of the Treasury, and if such board shall, after due examination, find the tea in question to be equal in purity, quality and fitness for consumption to the proper standards, a permit shall be issued by the collector for its release and delivery to the importer; but if upon such final re-examination by such board the tea shall be found to be inferior in purity, quality and fitness for consumption to the said standards, the importer or consignee shall give a bond with security satisfactory to the collector, to export said tea, or merchandise described as tea, out of the limits of the United States within a period of six months after such final re-examination; and if the same shall not have been exported within the time specified, the collector, at the expiration of that time, shall cause the same to be destroyed.

Section 7.—That the examination herein provided for shall be made by a duly qualified examiner at a port where standard samples are established, and where the merchandise is entered at ports where there is no qualified examiner, the examination shall be made at that one of said port which is nearest the port of entry, and that for this purpose samples of the merchandise obtained in the manner prescribed by Section 4 of this Act shall be forwarded to the proper port by the collector or chief officer at the port of entry; that in all cases of examination or re-examination of teas or merchandise described as tea, by examiners or boards of United States general appraisers under the provisions of this Act, the purity, quality and fitness for consumption of the same shall be tested, according to the usages and customs of the tea trade including the testing of an infusion of the same in boiling water, and if necessary, chemical analysis.

Section 8.—That in cases of re-examination of teas, or merchandise described as teas, by a board of United States general appraisers in pursuance of the provisions hereof, samples of the tea or merchandise described as tea, in dispute, for transmission to such board for its decision, shall be put up and sealed by the examiner, in the presence of the importer or consignee if he so desires, and transmitted to such board, together with a copy of the finding of the examiner, setting forth the cause of condemnation and the claim or ground of the protest of the importer relating to the same, such samples, and the papers therewith, to be distinguished by such mark that the same may be identi-

fied; that the decision of such board shall be in writing, signed by them, and transmitted together with the record and samples within three days after the rendition thereof, to the collector, who shall forthwith furnish the examiner and the importer or consignee with a copy of said decision or finding. The board of United States general appraisers herein provided for shall be authorized to obtain the advice, when necessary, of persons skilled in the examination of teas, who shall each receive for his services in any particular case a compensation not exceeding \$5.

Section 9.—That no imported teas which have been rejected by a customs examiner or by board of United States general appraisers, and exported under the provisions of this Act, shall be reimported into the United States under the penalty of forfeiture for a violation of this prohibition.

Section 10.—That the Secretary of the Treasury shall have the power to enforce the provisions of this Act by appropriate regulations.

Section 11.—That teas actually on shipboard for shipment to the United States at the time of the passage of this Act shall not be subjected to the prohibition hereof, but the provisions of the Act entitled "An Act to prevent the importation of adulterated and spurious teas," approved March 2, 1883, shall be applicable thereto.

Section 12.—That the Act entitled "An Act to prevent the importation of adulterated and spurious teas," approved March 2, 1883, is hereby repealed, such repeal to take effect on the date on which this Act goes into effect.—*American Grocer.*

DISTRICT ASSOCIATIONS.

SHEVAROYS.

PROCEEDINGS of the Monthly Committee Meeting held in the Victoria Rooms, Yercaud, on Monday, March 23rd, 1897, at 1 P.M., when there were present:—Messrs. C. Sice, C. Rahm, Junr., J. C. Large, W. W. Hight, R. Gompertz, E. H. King-Harman, C. G. Lechler (*Chairman*), H. W. Leeming (*Honorary Secretary*), and, as a *Visitor*, Mr. Howard O. Newport, *Honorary Secretary*, Lower Pulneys Planters' Association.

1. Notice calling the Meeting was taken as read.

2. Read Circular from the Chairman, U. P. A. S. I., re Act XIII. of 1859 and Counsel's Opinion thereon.

Resolved "that the Honorary Secretary be requested to forward to the Secretary, U. P. A. S. I., Mr. Robert Gompertz' views on the subject."

3. Read and recorded, with satisfaction, letter dated 10-2-97 from the President, Salem District Board, in reply to one from the Honorary Secretary, stating (i) that the necessary survey of the proposed cart road, from Salem to Yercaud, has been ordered to be taken by the P. W. D.; (ii) that the constitution of Yercaud into a Union, under the direct management of the Salem District Board, has been sanctioned.

4. Read and recorded correspondence with the President, Salem Taluk Board, re station roads.

5. Read letter, dated 11-3-97, from Mr. J. C. Large re reward to a Police Constable for the detection of a coffee stealing case.

Resolved "that the matter stand over till the next Committee Meeting."

6. The following papers were laid on the table:—i. *Proceedings* of the Annual General Meeting of the Wynaad Planters' Association, Central Travancore. ii. *Agricultural Ledgers*—Nos. 22, 24, 25 of 1895, and 30, 31, 32, 33, 34, 36, 37, 38 of 1896. iii. *Bulletin No. 5*—Agricultural Series—"A new method of tree planting." iv. *Planting Opinion* for January 9th, 23rd; February 6th, 20th; March 6th, 20th of 1897.

With a vote of thanks to the chair the Meeting terminated.

C. G. LECHLER, *Chairman*,

H. W. LEEMING, *Honorary Secretary.*

SOUTH MYSORE.

THE Annual General Meeting was held in Saklasapur on 4th and 5th March. On the first day there were present: Messrs. J. Aird, F. L. Allen, R. A. Anderson, J. E. Butcher, H. P. Cobb, J. G. H. Crawford, W. L. Crawford, W. M. Daly, C. F. deSalis, G. H. Eicke, A. M. Elder, J. G. Hamilton (*President*), F. M. Hamilton, J. A. Harris (*Hon. Secy.*), G. Horne, C. Hunt, P. Hunt, T. Hunt, L. F. Lake, C. Lake,

F. E. Limouzin, A. R. Park, E. M. Playfair, E. P. Playford, S. Sladden, J. Lee Stewart, and the following visitors: Messrs. H. M. Martin, Wachter, Taylor and Hudson. On the second day Messrs. Aird, Allen, L. F. Lake, C. Lake and Park were absent. The proceedings of the last General Meeting having been confirmed, the President made the following opening speech:—

"GENTLEMEN,—As you have a great deal of important business to discuss, and I hope a great deal to say about it, it is a good thing that you wisely determined to take two days over your Annual General Meeting; it would have been quite impossible to satisfactorily dispose of all our business in one short sitting, and unaccustomed as we are to this sort of thing, a long sitting means that after the first half everyone is tired and wants to break off. I have so much to say later on that I will confine myself to giving notice as to procedure, which will be somewhat changed this year. The Honorary Secretary's Report has always been cut about and amended and sent out as the Report of the Association to the world. This is for some reasons unsatisfactory, and you will not be asked to discuss the Report, which is the Honorary Secretary's Report to you. The items in the Report will be taken up in the order in which they stand for discussion and instructions to next year's officers, and I must ask members to give immediate notice of all other subjects which they wish to bring up, and these will be arranged as convenient and laid before you. I think also that it will be better to postpone the election of officers and delegates till the last, as it may be better that those nominated should know the policy they are called on to carry out. It might easily happen that your policy laid down at this meeting was so distasteful to one nominee that he regretted accepting office, and would carry out his duties in opposition to his own wishes, which would not fail to be very irksome. I propose to take a vote on this point as it constitutes a rather important change in our procedure. I hope with two days before us to be able to allow a little freedom of debate and shall not unnecessarily enforce our strict rules while I am in the chair, but I hope that you will try to make my task a lighter one than it has been on some occasions by refraining from private conversation in this room or even from desultory conversation among yourselves concerning the matter in hand. I propose to allow a few minutes for such conversation after the opening speeches on each subject and then to enforce the rules until, or unless it becomes evident or a formal resolution is proposed, that we should go into committee, when some freedom but not absolute licence is permissible. I now beg to propose that the Honorary Secretary's Report, of which you have all had a copy, be taken as read and adopted, and that the Honorary Secretary receive a hearty vote of thanks for his labours during the past year; every year the work becomes more and more important in nature, and in mere quantity there is a great increase, and I can assure you that I know that the past year has been no exception to this rule, and a vote of thanks has never been better deserved."

ANNUAL REPORT, 1896-97.

GENTLEMEN,—We have just passed through the worst season as regards crops that has probably ever been experienced. In most places blossom showers fell too late, but the year has altogether been a phenomenal one, and the S. W. Monsoon, the heaviest on record, caused leaf rot to set in severely, whereby much crop was lost. The promise for the coming year was, generally speaking, good, but a virulent attack of leaf-disease during January and February has marred it considerably. However those estates which have already been favoured with good showers should do well.

Famine.—In this province I rejoice to say that grain crops have on the whole been better than could at one time have been reasonably hoped for, an exceptionally heavy fall of rain in late November having saved a considerable portion of the dry crops. Throughout the greater part of the Empire, however, the outlook is very gloomy, and it behoves us to contribute our mite towards alleviating the terrible distress. The U. P. A. S. I. has issued an appeal which I hope will be responded to as liberally as circumstances will permit.

The Plague.—If this terrible pestilence should make its way into this province and into Mangalore and its neighbourhood, our labour supply will be very seriously affected. I trust the authorities in the latter place, bearing in mind the large quantities of coolies that come up to Mysore from S. Canara, will take such measures as are possible to prevent the spread of the disease. The Durbar no doubt will introduce into the province "The Regulations under the Epidemic Diseases Act of 1897 for District Municipalities and Towns and Villages" and will meanwhile make all preparations necessary for carrying them out.

Committee of Enquiry.—The sitting of this Committee has been the most important event of the year, and on the tenour of its report depends to a great extent the welfare of the planting industry. It would seem that our safety lies in the introduction of a new Labour Law, for the

Government of India have recently questioned the legality of the present procedure of issuing warrants, and appear to maintain that warrants under Act XIII cannot be executed outside the jurisdiction of the court which issues them. This would to a great extent stultify the Act and leave us more than ever at the mercy of defaulting maistries and coolies. The U. P. A. are watching our interests in this matter.

Labour.—The supply has been more plentiful than for some years past, and I agree with the gentlemen who wrote from North Mysore that an opportunity is occurring to check the upward tendency of advances. Ghaut especially have come up in increasing numbers, but Tamil labour having proved generally unsatisfactory and untrustworthy, has been less employed. Mr. Wilkins' Tamil Agency has proved a complete failure, and I fear that those who advanced him money will lose it.

U. P. A. S. I.—The book of proceedings recently published testifies to the strong vitality of the Association, and to the energy of the new Secretary. I regret that owing to an oversight our statistics were not included in the book. The question of individual membership will be again discussed at the next General Meeting, and your delegates should go prepared with definite instructions. Briefly stated the arguments in favour are—(1) That sufficient funds would be raised to build up a Reserve, as well as for ordinary expenditure, and (2) That a wider interest in the Association would be created; those against are—(1) That the balance of voting power would be upset, and (2) That by increasing the number of members proceedings would be greatly prolonged. I request that you will give this matter your earnest attention.

The Dusserah.—The President represented us, and in a report which has been circulated, has told us of the matters which received his attention.

Police.—Government, in compliance with our request, have been pleased to increase the strength of the force in the Mulnaad, and to slightly raise the wage of the men; the pay of the Duffadars is however still insufficient to induce competent men to enlist, and I trust Government will in the coming year effect an improvement in this direction. Coffee stealing cases have been less numerous, due no doubt in some measure to increased vigilance on the part of the police, but partly also to the scantiness of crops. Only one reward has so far been given. I have had some correspondence with Government regarding the transit of coffee with a view to inducing them to issue pass forms. A difficulty appears to be that in Section 10 of Act VIII. of 1878 the fact that the owner might cart his own coffee was not contemplated, but I think this might be got over by the issue of a different form.

Roads and Communications.—*Gonibide-Belur Road.*—I congratulate the Executive Engineer on the excellent work he has done from the 11th to the 16th mile stone, but in doing so I would draw his attention to the enormous traffic and to the necessity of keeping the road in constant repair, in order to enable it to bear the strain. Already in some places it is worn into holes. The remainder of the road from Tholul to Belur is mostly in bad order and urgently requires attention.

Saklaspur-Chickanhully Road, hitherto known as the Ossur-Gonibide Road, is being cut, but the Engineer's work is apparently hindered by Government not having acquired the land at the points where the track passes through private property. I most respectfully request them to be good enough to settle this matter as promptly as possible; so that the work may be completed this season. When this road is finished it will be our duty to draw the attention of Government to the desirability of cutting one from Chickanhully to Chickmagalur, which is a natural sequence to the Saklaspur-Chickanhully Road, and would put Chickmagalur and Saklaspur in direct communication, an important consideration in view of the Railway coming to the latter place.

Saklaspur-Mudigiri Road.—I referred last year to the crossing at Anjur which is in no way improved, and is a great impediment to traffic of all descriptions. Now that Government has sanctioned the building of the Tadasa and Hole-Nursapur bridges, I would strongly urge the construction of one over the Hemavati at Anjur. The depth of the river in flood would render the erection of any other work than a bridge unsatisfactory.

Chickanhully Shante.—I have to thank Government for so promptly sanctioning the establishment of this new shante, which will be held on Sundays at a point on the Saklaspur-Chickanhully Road central for many estates belonging to both Europeans and natives.

A Mail Tonga will run between Kadur and Mudigiri from the 1st April and should prove a very serviceable institution. It is proposed to extend it later on to Mangalore. It is important that the times of arrival and departure should be so regulated as to suit the gentlemen who use the Mudigiri P. O., and I would specially draw the attention of the authorities to this matter. The Postal authorities have refused to sanction a Telegraph Office at Belur unless an income of Rs. 50 per mensem is guaranteed, and though that amount may reasonably be expected, I fear no one will guarantee it. The Gonibede P. O., now located at Chickanhully, has been recommended as a branch office with a postmaster at Rs. 15 per mensem and sanction may shortly be expected.

Railways.—It is gratifying to observe the forward policy of the Dewar

with regard to Railways. He is fully aware of the immense advantages accruing from opening up the country, and is encouraged in his views by the increasing returns on the lines already existing in the province. In spite, therefore, of the gloomy prognostications that the proposed Mangalore-Arsikiri line would not pay more than 1¹⁰/₁₀₀, I think we may look forward to its being constructed in the near future. From statistics collected it may appear that traffic returns would not be such as to induce Government to sanction the line, but a railway cut through a rich agricultural country, which would put that tract for the first time in direct communication with a seaport, would not leave trade where it found it, an immense stimulus would be given and a large expansion take place. Meanwhile the branch line from Shimoga to Birur is being made, and the Durbar have expressed a wish to construct a line between Arsikiri and Hassan at their own expense, and have submitted proposals to the Government of India regarding it. I regret to hear that the S. M. Ry. has closed its out agency at Chickmagalur, but I believe it will be re-opened shortly.

Cardamoms.—Crops this season were very short and high prices have ruled. The Revenue Supt. has not as yet issued his report regarding the re-assessment, though it is now more than a year since he was deputed to make the enquiry.

Sanderson Memorial Ward.—The building is in course of construction but will scarcely be finished before the monsoon. I think it advisable to state here that the planters subscribed their portion of the money on the distinct understanding that the ward should be for the exclusive use of Europeans, that preference should be given to planters, and I have, in writing to the Deputy Commissioner, informed him again of this. I take this opportunity of thanking Government on behalf of subscribers for the liberal manner in which they have provided the balance of funds required.

Local Officials.—Government are to be congratulated on obtaining the services of such a high class official as Mr. Weir as Deputy Commissioner of Kadur. Mr. Bowring's appointment as Assistant Commissioner of Saklaspur, and Mr. Davy and Mr. Rice's as Sub-Divisional D.P.W. Officers are noted with satisfaction. It is a matter for sincere congratulation that the attitude of natives towards Europeans referred to in my last Report has greatly improved, and our thanks are due to the Dewan whose visit last year had a salutary effect; the policy of increasing the number of European officials in the district will no doubt tend to preserve good relations. The post of Deputy Commissioner of Hassan has been temporarily filled by the appointment of Mr. Krishnaiengar; he will have a difficult task before him to follow in the footsteps of his esteemed predecessor, who by his exceptional qualities was eminently suited to be the head officer of a district in which Europeans have so large a stake. Government may, I fear, experience great difficulty in finding an official from among their own ranks who will adequately fill the post, and I earnestly hope they will either form the whole coffee area into one district under a European Deputy Commissioner with two European Assistants, or else appoint a European to Hassan.

Funds.—At the Extraordinary General Meeting last October, the following resolutions were passed:—(1) that in order to meet the call for funds by the U.P.A. this year, a donation list be immediately circulated, and the amount collected remitted to the Honorary Secretary; (2) that from 1st April 1897 Rule 11 be altered as follows:—(a) Each member shall pay an annual subscription of Rs. 10. (b) Every member who is a proprietor shall pay a crop assessment on the yield of the past season as follows:—

Rs. 3 per ton on 4 cwt. per acre or over.
 " 2 " " " 3 " " " but under 4.
 " 1 " " " 2 " " " " 3.
 Nil if less than 2 cwt.

Coffee under 3 years' old not to be taken into account; both the above shall become due on 1st April in each year; (3) that the Committee be deputed each year to decide what contribution over and above the annual subscription shall be made to the U.P.A. It will be observed that according to the above the new rate would come into force on 1st April 1897. It was my intention in proposing it that the alteration should not be made till 1st April 1898, and I suggest that the resolution be changed now to that effect.

Members.—Mr. Edwin Hunt and Mr. Cochar have resigned, but there are four new members, Mr. C. Lake, Captain Foster, Mr. C. Hunt and Mr. W. Egerton, so that now our numbers reach 50.

Accounts.—Those for the year are on the table showing a balance of Rs. 488-4-0 at credit.

In conclusion, I wish to notice with regret the departure of our late Resident, Mr. Mackworth Young, and to make a further protest against such constant changes. Col. Donald Robertson, his successor, has recently been through the district, and the President and myself had the privilege of calling upon him. Placing the resignation of my office in your hands,

I beg to remain, Gentlemen,

Your most obedient servant,

J. A. HARRIS, *Honorary Secretary.*

The Honorary Secretary's Report having been adopted and a vote of thanks to him passed by acclamation, Mr. R. A. Anderson said he thought the President's proposal regarding the election of the execu-

tive an excellent one, and proposed "that the election of office-bearers be left to the end of the meeting on the second day," which was seconded by Mr. Stewart, and carried.

Famine Fund.—Mr. Harris mentioned that since he had solicited subscriptions towards the U. P. A. S. I. Famine Fund, he had noticed that the Mysore Durbar were organising a Fund, but thought that much as they would like to support the former, they could not do both, and had better adhere to the original intention. This was approved of.

Accounts were audited by Messrs. Aird and Daly and found correct.

U. P. A. S. I. Individual Membership.—Mr. J. A. Harris moved the following resolution:—"That this Association is opposed to the admission of individuals as members of the U. P. A., and will depute its delegates at the next General Meeting to vote against their admission," and said: Mr. President and gentlemen,—I admit there is a good deal to be said in favour of the admission of individual members to the U. P. A., but the strongest argument is that it would ensure a certain and a permanent income, for I have not the slightest doubt in my own mind that Mr. Parsons was right when he said "that surely out of the 1,000, more or less, planters in S. India, 150 would join the U. P. A."; and if the subscription were Rs. 25 per head, Rs. 3,750 would be raised, which, together with the subscriptions from Associations, would suffice. This is indeed a forcible argument, for as you are aware Mr. Acworth's donation scheme has scarcely met with the success he hoped for, and the U. P. A. is hampered for funds, which it is absolutely necessary to raise in order to enable it to carry out its great work. Another argument used is "that the admission of individual members would create a wider interest in the U. P. A." This might be so, but it is manifest that there is at present a very keen interest. I should rather be afraid that it might detract from the interest now taken in the District Association. Again it is urged that by the present system delegates attend the conference crammed with their Association's instructions, and do not give vent to their own opinions; in fact that individuality is stifled, but I would point out that though delegates must vote according to instructions, there is nothing to prevent them expressing their own opinions in the course of debate. The only point then that has much force is that an adequate income would be provided. But let us look at the other side of the question, and let us try (1) to deduce such arguments as will prove the scheme unwise, and (2) endeavour to evolve some plan by which funds may be raised. First I maintain that the admission of individuals would upset the balance of voting power. In order to make my arguments clear I will briefly explain the present system of voting. Each Association may acquire the privilege of 1 vote by paying Rs. 75 per annum and may acquire up to 5 votes at the same rate, but no more; there is therefore a certain check put on the possibility of one or more Associations becoming too powerful. Now what would be the result if individuals were admitted? In considering this point I would ask you to bear in mind the enormous area over which the various planting districts are scattered. It is not like Ceylon, where all are comparatively close. What then would be the result, why from those Associations which are near Bangalore many would join, while from those like Travancore few if any, and the latter would find themselves outvoted on every question in which they were in opposition. You will perhaps say why should not members from distant Associations join? Well, I would refer you to the debate at the Conference last year, when some gentlemen representing the distant Associations stated that it was with extreme difficulty that they were able to induce even a single delegate to travel so far. How then can it be expected that individual members would attend? Why not allow proxies? Gentlemen, I would again refer you to the debate last year in Bangalore, in which the delegates of some of the distant Associations pleaded for proxies to be allowed, and when a guarded measure was reluctantly passed because it was felt that even in such a measure there was danger. How much more danger would there be if proxies were generally allowed? Why! the Conferences might deteriorate into paper meetings, at which the Chairman and the Secretary, alone present, would count the votes! I don't say this would happen, but it might, and the U. P. A. would lose power and influence. Mr. Parsons suggested by way of maintaining the balance of voting power that the value of the Association vote should be reduced to Rs. 10; but though this might prevent delegates being outvoted by members of their own Association, it would not alter the relative voting power of the different Associations. Another suggestion which I believe has been made is that the Committee should be formed into a sort of Upper House, and that with

them final decisions should rest. I ask is it likely that individuals would join in this case, when they would be allowed to talk but not to vote? My second objection is that Proceedings would be greatly prolonged. More members would attend the Conference, the Chairman's task of keeping order would be much greater, there would be more desultory talk, more diffusiveness, and probably business would be less satisfactorily conducted. To my mind the present system answers admirably; without any disparagement to District Association Meetings I would say that diffusiveness is, so to speak, boiled down there and the "concentrated essence" served up in Bangalore. It may be said what is the objection to proceedings being lengthened? Some delegates can scarcely spare the time to attend the three days' sittings, and certainly would not be able to come were the meetings to occupy a much longer time. But, gentlemen, there is a third objection and one which appears to me to have been rather lost sight of. If the principle of individual membership were accepted, it would alter the constitution of the U. P. A. I maintain that two qualities of votes cannot exist in one institution. If you admit the individual vote, you must cancel the Association vote. Mr. Parsons' intention appears to be to keep both, but even if I am not right as to this being unconstitutional, I feel perfectly assured that the Association vote will cease. The existence of the two is an anomaly, for instance a delegate would vote for his Association, and might if a member himself vote as an individual. Gentlemen, this is a very grave consideration, the U. P. A. S. I. is an Association of Associations, themselves powerful bodies. It is the representative of the whole of all these bodies, and as such has built up for itself a name and a strength which has commanded the attention of the empire; it has been connected since its foundation in our minds, and in the minds of all who have watched its progress with the several planting districts of S. India, and has caused a feeling of kinship and of friendly rivalry to grow up. I feel convinced if we were once to admit individuals as members of the U. P. A., it would degenerate into an Association of individuals, instead of an Association of Associations, and its power would rapidly decline. The District Association would one by one drop off, and the U. P. A. would no longer be the representative of the whole planting community of S. India, but only of those 150 or so individuals who were members. I think I have brought forward sufficiently strong arguments to prove the undesirability of admitting individuals as members of the U. P. A. Let us now consider if funds cannot be raised in some other way. I have explained the present system of subscription, and I would suggest an extension of it. I would raise the value of the Association vote to Rs. 150, which, presuming the subscribing Associations agreed, would produce an income of between Rs. 6,000 and 7,000. This should suffice for all ordinary expenditure, and leave something over to add to the Reserve. You will ask would the District Associations agree to it? I think so, judging by the keen interest displayed in U. P. A. affairs, and by the willingness with which they agreed to a 50% increase last year. It would of course be open for any Association to reduce their number of votes were they unable to pay the enhanced rates, but I think *esprit de corps* would prevent this being necessary. I maintain as a principle that the U. P. A. must look for its permanent income from the Associations and not from individuals, but in order not to check the generosity of those who wish to contribute largely and in order to help the fund to pile up, I would keep Mr. Acworth's donation list always open, and let such amounts as might be collected be added to the Reserve Fund. Gentlemen, I think I have proved my case. I have shown that there are such strong objections to the admission of individual members to the U. P. A. that it would be unwise and dangerous to adopt such a course! I have shown that geographically it is impossible in S. India, where distance is so great a factor; I have shown that it might lead to the secession of one Association after another, and would be the beginning of the disunion of our union; I have shown that proceedings would be inconveniently prolonged, and I have endeavoured to prove that once admit individuals as members, you would sound the death-knell of the U. P. A. S. I. as an Association of Associations and convert it into an Association of individuals with diminished influence and power. Further I have suggested a way by which sufficient funds may be raised to enable the U. P. A. to fulfil what is expected of it. I urge your support in this matter and ask you to send your delegates to Bangalore charged with instructions to vote against the admission of individual members.

Mr. J. G. Hamilton said he was unaware that Mr. Harris was going to speak on this subject, and had himself prepared a

speech. He agreed with Mr. Harris on all points save one, and that was that the hands of the delegates should not be tied. He then delivered the following speech:—

I think it is certain that Mr. Parsons will push his ideas with his well-known energy at this year's Conference, and we must send our delegates there fully prepared to exercise such discretion as you would use yourselves to vote for or against him, or to suggest amendments as after a consideration of your opinions may seem good; we must not oppose it without any reason if Mr. Parsons proves that he can raise more than I think he can, but at the same time if you thoroughly disapprove of the principle you must give your reasons and not simply send your delegates to vote blindly against it because your delegates last year did not approve. Those of you who take an intelligent interest in affairs have, I presume, perused the Book of Proceedings containing the discussions which take place in committee and which are of course not published in the press, and you will be well acquainted with the arguments brought forward for and against the scheme. Mr. Parsons' Urgency Fund of Rs. 10,000 has been, I daresay, already subscribed under the Resolution of last year, but I hope that if this scheme is to be accepted, this may be considered as an extra and that the scheme in its entirety involving the collection of another fund of Rs. 10,000 will be adopted perhaps it might end in more money being collected if he would alter it to Rs. 5,000 per annum which I understand North Mysore desire. I shall say something about Mr. Hay's scheme before I finish. Mr. Parsons' idea of an Urgency Fund can only be opposed on the ground that the sum named is so small that it may be soon exhausted and there is always a difficulty about raising money amongst coffee planters especially if you keep on running round with the hat for new funds. As for his individual vote scheme, I gather from Mr. Ormerod's letter that Mr. Parsons' prophecy that out of the 1,000 planters 150 could be found to subscribe has been fairly justified, so that we may take it that the hand-to-mouth existence of the U. P. A. is assured; but that is not enough; we have and shall have many channels for the spending of much money in a useful manner, and we must have external sources whence to provide the wherewithal to feed these channels, and it is for you to say whether Mr. Parsons' 10,000 will last for the decent interval which must elapse before we are likely to be able to raise another fund, or whether in your opinion there will be such an increase of individual subscribers as will provide the necessary funds. Personally Mr. Acworth's ideas are more to my liking and Mr. Newport's life membership idea is a combination of the two schemes which should be well considered. Mr. Acworth provides an ever open list, and Honorary Secretaries have only to secure one good donation or a promise such as was made on our original list to pay a small sum yearly for five years and then he will let such subscribers alone and only have to wake up non-subscribers and new-comers. My two objections to Mr. Parsons' scheme are entirely connected with the individual vote principle, and are (1) that with the general want of practical working interest in Association affairs sufficient men will not be found to join to make it worth while to alter the Constitution of the U. P. A., which was started as an Association of Associations and should remain in that form; Associations represent the opinion of the majority of thinking men in the districts and the delegates are supposed to be the best men in each Association; and unless very good cause can be shown, such as a very large permanent revenue, it should not be made possible for a factious and energetic minority to oppose the wishes of their district in general; we can easily take precautions which will prevent their outvoting their delegates, but we cannot prevent the harm and dissension they may cause by their speeches. (2) That to avoid the danger of say Coorg and Mysore from their proximity to Bangalore swamping all the other districts on a disputed point, proxies must be admitted, and once you do that you destroy the value of the yearly exchange of opinions. If also proxies are to be general, too much power may be gained by one man (for I am presuming that a large number of members have joined) who has energy enough to write round and call round and collect proxies. Or if they are to state in which direction the vote is to be given, they are giving a blind and unconvincible vote which confers no benefit of opinion and is not open to the benefit of the opinions of others. These dangers can be partly met by the proxies being made open and only available through the Association delegates, but even then one large and rich Association might collect too much paper authority and get an undesirable amount of power into its own hands, and if the delegates are obstinate men or bound by the wishes of the majority of their Association to vote in a certain manner, these vote

practically unconvincible. We have before now had delegates confess that they personally agreed or disagreed but were bound to vote against their convictions. Now let us consider Mr. Hay's scheme; this I believe is that 5,000 be raised at once as an Urgency Fund to be renewed yearly if necessary, and further that Associations should raise as much as they can in their own way and purchase U. P. A. votes as many as they can at say Rs. 200 each. Now, gentlemen, I like this perhaps a little better than Mr. Parsons' as it keeps everything in the same form as at present, but are you prepared to keep your Association in the first flight? At present we have the same voting power as the big Associations, and the Honorary Secretary knows with what difficulty the funds are provided. Year after year you decline to raise your subscriptions to a good round sum, so year after year you have to listen to proposals for a fresh increase. Now a fair proposal may be put before you, if you will not accept the best—which is Mr. Acworth's—and it is for you to say whether you will give us enough money to pay at least double the present subscription to the U. P. A. and at the same time pay about Rs. 500 per annum towards an Urgency Fund. To do this you must accept at least a Rs. 5 per ton assessment without any sliding scale; a very large number are, I know, quite willing to do so, but a sufficient number hang back to deter me from making such a proposition myself, though I hope to hear it discussed at this meeting when we come to the heading of accounts. Gentlemen, I do not ask you to tie your delegates' hands with instructions; you always act in a liberal manner. That respect, pray continue to do so; but please give them your opinions and wishes and leave the matter in their hands.

Mr. Stewart having expressed himself in agreement with Mr. Harris, Mr. F. M. Hamilton said he thought it would not be wise to tie the hands of the delegates, and suggested that in the event of the large majority of the District Associations being in favour of individual membership, the delegate in voting should be allowed to use some discretion. After some further discussion, in which Mr. Harris stated that he was only asking for instructions to be given delegates regarding a matter of principle, viz., as to whether U. P. A. should or should not admit individuals as members, and not that their hands should be in any way tied with respect to details of any scheme that the U. P. A. might adopt, Mr. Harris' resolution was carried by a large majority. Mr. Stewart then proposed and Mr. Daly seconded "that the principle of Mr. Harris' scheme for raising funds for the U. P. A. be accepted and that the delegates be allowed discretion to vote for the raising of the value of the Association vote in connection with this, or any similar scheme, to Rs. 200." *Carried.*

Funds.—Mr. Stewart said, with reference to the proposals of Mr. Harris, which were accepted at the extraordinary general meeting in October last, viz., that a crop assessment should be levied as follows:

Rs. 3 per ton on 4 cwt. per acre or over.

" 2 " " 3 " " " "

" 1 " " 2 " " " "

Nil if less than 2 cwt.

that in the first place he considered this would fall unfairly on the estate that was highly cultivated and cropped well, and in the second place that not sufficient funds would be raised. He proposed a fixed tonnage assessment which Mr. Playfair supported. Mr. Eicke opposed a fixed tonnage assessment, though he personally agreed with it, on the grounds that many would object to it, and perhaps refuse to pay it, and that it was advisable to aim at a scheme which, being least objectionable, would be likely to be accepted.

Mr. F. M. Hamilton agreed with the principle of Mr. Harris' scheme, but was convinced that sufficient funds would not be raised hereby, and proposed the scale should be raised as follows:

Rs. 4 per ton on 4 cwt. per acre or over.

" 3 " " 3 " " " "

" 2 " " less than 3 cwt.

which was seconded by Mr. Eicke.

Mr. Harris supported his original scheme and proposed a resolution in favour of it, which was carried by 13 to 9.

The Honorary Secretary's proposal "that the new rules shall not come into force till 1st April 1898" was agreed to.

A proposal "that cardamoms shall be assessed at the rate of four annas per maund" was accepted.

Meteorology.—Mr. Elder said:—"The Mysore Government, as you are aware, have established one first class and three second class stations all in the open country, and as far as I know there is not one along the whole range of the Western Ghats even in British territory.

Situated as we are on the very edge of the Mysore plateau, a station say in Mudigiri would be admirably suited for observing wind currents, changes of barometer pressure, &c., and besides being of great value from a scientific standpoint, it would be of much interest to the planting community as we could get early notice of approaching storms, both telegraphically and from observations on the spot. I therefore beg to move the following resolution: "That the Government of Mysore be requested to establish a meteorological station with continuous observing instruments at Mudigiri, at which atmospheric conditions may be carefully recorded, and which shall form an intermediate station between the west coast and the maidan country of Mysore." This was seconded by Mr. J. G. H. Crawford, and carried.

Act XIII. of 1859.—The Honorary Secretary drew attention to his remarks in the report and emphasised the gravity of the situation. He felt sure this Association had approved of every word the Honorable Mr. Hodgson had written on this subject, and of the action the U. P. A. were taking. He next drew attention to certain rulings of the High Courts of British India, and it was resolved that he should inquire if these were accepted by the High Court of Mysore. Some discussion took place regarding the drafting of a Labour Form of Agreement, and Mr. F. M. Hamilton proposed and Mr. Elder seconded, "That as soon as the Report of the Labour Committee is issued, the U. P. A. shall be requested to get forms of agreement between planters and maistries, planters and coolies, maistries and coolies, drawn up in proper legal manner."

Labour.—Mr. J. G. Hamilton drew attention to the Honorary Secretary's remarks in the report and said that an effort should be made to reduce advances. If old maistries could not be cut down, new ones might at any rate be advanced at a lower rate. There had been more or less of a panic in some quarters regarding the insufficiency of coolies, and in consequence reckless throwing out of money, which he strongly deprecated. After some discussion the sense of the meeting was taken and an opinion recorded that each individual should do all he could to reduce advances.

Police and Coffee Stealing.—Mr. J. G. Hamilton said:—

COFFEE STEALING.

While the year is hardly far enough advanced for the collection of that information which generally reaches us too late, and while the great receiving depôt at Devarunda is hardly yet open, I feel little doubt that as the organisation for the disposal of stolen coffee improves, and no material improvement is made in the number of personnel, or activity of the police, coffee stealing in one form or another will every year increase, the quantity stolen will go down in such a bad year as we have just gone through as looting is made unremunerative, but the thieves improve their systems and appetite is perhaps increased by partial abstinence; it is therefore to our best interests to set to work and suggest some improvements in the carrying out of the law which being defective does not entirely protect the coffee thief at every point! We must not at present touch on any amendment of the law as the subject is under consideration by the Government of India. There are, and perhaps always will be, in this country great difficulties in the way of those who wish, while effectively protecting the honest to expose the dishonest, and every check we impose on ourselves puts a weapon into the hands of a dishonest policeman for oppressing small pariah holders. With all this the evil is such a serious one that the situation must be faced boldly, and I claim your assistance now in suggesting for consideration by our community and the Government of Mysore, and later for submission to the U. P. A. such measures as will in your opinion enable us to carry on our vocation without an undue amount of loss which should be humanly preventible. We suffer enough from drawbacks for which there is no remedy. I feel sure that if all districts can agree to certain precautions, much good will be effected by similarity in the working of our systems. Some of our ideas may not suit all districts and some other ideas may not on the whole suit us, but full consideration is generally given by delegates at the Conference to all objections and in the long run their decisions will be found fair to all. There are so many stages at which stealing can be carried on that the subject is a most complicated one, and one which cannot be thoroughly disposed of at one sitting of our Association, though I am certain that at various times some practical measures will have suggested themselves to almost every one of you. In the first place naturally looting from the trees will strike everyone as the first stage at which stealing can take place, but against this I do not intend to suggest any special remedies as it is a crime the commission of which managers may be reasonably

expected to detect, and I regard the difficulty of detecting the fact that a crime has been committed as our most serious one, and improvements in the police and the general working of the law would lead in many cases to the detection of the criminals. Next perhaps will come the thefts by our own curing coolies and watchmen. We may, I am afraid, take it for granted that no uneducated native is honest except from policy and then generally only temporarily, and therefore, unless it is made very probable that thefts will be detected and punished, those left in practically undisturbed charge of a valuable commodity all night are certain to appropriate more or less according to their ideas of honesty or respect for the law. In this matter a systematic exchange of outturns and great regularity in measuring with a careful examination of the outturns from each field would in time lead to more check than there is now, but this can never be complete, as we all know that outturns vary from year to year, and detection is therefore very difficult. While on this subject I would advise every planter to abandon the present loose system of bushel measurement and adopt that of weighing the fruit at all events. I will not advise the weighing of parchment, as that being measured by struck bushels is fairly regular, and until a standard be established which cannot be done without considerable expense of time, money and trouble, we should only be making things worse. Many planters now weigh and would be most happy to teach their neighbours all they know. Perhaps other districts can give us some hints in this matter. At present we go on repeating that 100 bushels of fruit give 50 of parchment, but how many men take the same bushel from their coolies and how many get 50% outturns. Police watchers and imported watchers have been tried, but their success has been worse than doubtful. Policemen have been caught stealing and so I believe have the imported watchers. Covering up the vats is an experiment I am going to try, which if it does not damage the coffee may prevent stealing the fruit and wet parchment, but will not affect the parchment cherry and tails (which last are more stolen than anything owing to irregularity of outturns) lying on the drying grounds. Nothing can stop this but an efficient and vigilant police, with a detective force separate from the executive establishment. This last prevention may be taken to cover the most common, (in this district) most annoying and probably in the end most serious form of stealing, the petty pilfering of our own coolies, pickers and others. Nearly every toddy-shop and petty angadi in the country is a depôt for stolen coffee. Some good was done in Belur last year by the infliction of small fines on a number of these who were detected by the special Jemadar, but in the Mulnaad detection is still at a very low level. Nearly every native planter on the lower scale is willing to increase his crop by cheap purchase if he does not (and it is a small minority who do) condescend to steal for himself. I regret to say that a certain number of those who cannot be considered as altogether on the lowest scale have at times fallen under suspicion of dealing with some of the larger receivers; all these men are directly or indirectly maintained by our petty pilferers. I believe that the curing coolies when in a larger scale of business have other channels. Lastly comes the stealing by cartmen (for I put bungalow servants of whom the lower classes are often the worst thieves and are often used as intermediaries among the last named gang). This I believe to be easily detectable with careful packing on the estate, and a thorough investigation by the curer, the only difficulty being when the amount stolen is in value in excess of the cart hire remaining to be paid. We in S. Mysore are particularly fortunate in that we can get the Hassan Gowda to go down to the coast; he is one of those whom I reckon indifferent honest from policy. He is a man with an immense idea of himself, generally very wealthy for his station, and has a solid dislike to anything in the shape of Criminal Law, though he probably enjoys a civil suit as well as any man; these men will not steal if it is made difficult and risky. I believe that the simple precautions I adopt while capable of improvement have kept my coffee comparatively free from theft for some years. This may be considered as happy ignorance, but I admit that my curing and other coolies steal my coffee and ask that my belief that the cartmen do not may be accepted. I use the same bushel as my agents and cut every bushel fine, pack 3 bushels exactly in every bag, seal 10% on every knot and enclose these sealed bags mouth downwards in other bags which are again sealed on every knot. I send my coffee down very dry and expect to lose 1%. I do lose about this and generally find

that if there is a difference it is in favour of the unsealed bags. No if my agents on the coast minutely examine every test bag as I suppose they do, they cannot fail to find marks if a gauge or scoop has been inserted, fibres of the outer bag can be worked together again but not those of the inner bag, the addition of a linen bag inside would in my opinion make this test perfect. There can be no doubt that it is the clear duty of every agent to fine the cartmen in case the bag differs from the test bags and the duty of every planter to uphold him. I have forgotten to state above that test bags ought to be weighed and a few of the other bags (secretly marked) also. I have not always done this, but it might often assist the curer to a right decision. Now to try and suggest measures for breaking up the present almost perfect organization for disposing of stolen coffee, and let me begin by acknowledging the difficulty of the task we expect from the police as well as the almost entire failure in most parts of the Mulnaad. A portion of the law being under consideration by the Government of India, I must refrain entirely from any criticism of the law itself and pass on to mere matters of local procedure under Sec. 10, where I think much improvement is possible. This section forbids the removal of coffee by any person, without the permission of the owner in writing. It commences "no person shall, &c., &c." and a very great deal depends on the interpretation of the word "No person"; if they be held to include owners themselves well as good, if not a very large loophole for escape is left. In the first place I would suggest that to assist the working of this section and the Act generally, we take the excellent system adopted in Wynaad as a base; we may be able to suggest alterations or additions calculated to meet local conditions, but with the evidence of the U. P. A. before us that Mr. Fawcett's system, coupled of course with his personal experience has checked stealing in Wynaad, we may assume that the system mentioned in his evidence before the Committee is a sound starting point. I beg to suggest as my contributions for discussion—(1) That the crops of all gardens be estimated and the estimates filed in the police thana to which the garden is nearest; that such estimates be made in June and checked in October. (2) That Sec. 10 shall be strictly enforced on all persons without distinction and that the permits or passes in question must be on forms procurable only at the police station in which the estimate was lodged, or in the case of purchased coffee that under the jurisdiction of which the business is carried on, and shall be in quadruplicate, one copy to be kept by the producer or purchaser and shown when required under Sec. 5, one copy to be filed in the issuing police station, one shall accompany the coffee and be visé by every policeman and every thana passed, and in the case of coffee going out of Mysore delivered up at the frontier station or otherwise at the last station passed, and the last shall be delivered to the consignee after in case of coffee passing through British Territory being visé by every British policeman and thana passed. In the case of more than one person, animal or vehicle being employed in carrying the coffee, full details shall be written on the back of the pass as to the quantity carried by each person, animal or vehicle. Every pass shall be signed by the head officer of the issuing thana. To these precautions I expect strong opposition, and I endeavour to disarm some of it beforehand. In the first place I appeal to those who will object to it on the score of the trouble involved, would ask them to give the matter very careful consideration and refrain from throwing obstacles in the road of those who suffer from the evil and are seeking a remedy. There may be some fortunate or skilful who do not suffer, and it is those from whom I ask a little tolerance for the ill-luck or weakness of their neighbours. As for those who suffer, I believe that hardly any cost will be too great if a paralytic evil can be put a stop to even in a small degree. I believe, too, while the idea seems to involve a great deal of inspection and trouble I shall find that the machinery will get into smooth working order in one season, and thenceforward be no more irksome than payment of tolls or any similar duty of daily life. The strongest opposition I expect is from Government, and coffee stealing sources which for once in a way unite to point out the inexpediency of throwing weapons of extortion into the hands of the police. This to a casual observer seems to be a most weighty argument and I ask you to let me try to meet it. Let us consider the effect on the small planter who *bonâ fide* takes his own crop on his head or in his own cart and there disposes of it for cash or barter it for other goods; it will be held a hardship that he should be forced to put himself

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. D

ay under police supervision and put to a lot of trouble, &c. I must nit that at first sight this is a moving tale, but on full examination ppears to me that the hardship is somewhat exaggerated. It is no dship to force a man to go to a ticket office to purchase a ticket for journey, or to force a man to travel miles to a taluq cutcherry or er large place to purchase a stamp paper to write out an agree- nt, plaint or bond which he may never have to take to a cutcherry. w granted that time is of little value in this country, and we all ow that a man, even one fairly well off will sacrifice a day's pay s. or more) to go to a second sante in the week if he finds, let us for an example rice only 3 seers for the pauli (4 as.) and he hears t he can get 3½ at the other. We have often met with this sort of gin in actual life and probably been annoyed by it in the case of lies. Granted then that a high value cannot be set on a walk to nearest thana, generally about 2 miles, I think you will agree h me that the apparent hardship is not such a big matter after

As for throwing a weapon of oppression in the way of the police, ke it that the price of these passes will be about 3 pies each, and must expect that the police will charge another 3 pies. I do not nk it will be more, for I know that they only take 4 annas on a nna gun licence. Is 3 pies or so such a very serious matter? Men n't pay more; I have had a man deposit his gun in my bungalow d tell the duffadar to come to me when he demanded an 8 anna be in place of the usual 4 annas. It must be remembered that ngs are no longer as they were. We have taught the people ny things to our cost; there is not a holier in the Mulnaad who es not know his own value and put a couple of hundred per cent. op of it when it suits him. The real old oppression is pretty well ne away with; a man is only blackmailed when there is a fair case ainst him: and if he is not to be brought to justice, the next best ing is that he should be looted. As a matter of fact these passes ce granted will form an actual protection against blackmail of one rt, for they will be of a certain official muster and easily recogniz- le; while at present the policeman meeting a petty owner carrying coffee without a pass can always get a few pies out of him to avoid ouble, and any peon not known to be literate may assert if a pass roduced that he does not believe it is a pass and the bearer must ne along to the thana or hand over a "fine"!! (3) I would sug- st that we ask for a further increase of the Police force at all events ring certain months. As far as the Mudigere taluq is concerned, obably 15 men more put on to the regular staff should be sufficient. hink they would be fully employed all the year round, but another should be added as a special detective force, who should never ear in the taluq or near it in uniform; any who might be consid- ed superfluous in the hot weather and monsoon could be drafted to her work or kept in a reserve; but from 1st October to 30th April ey should be kept in and about this taluq. I cannot suggest numbers r other taluqs, but of course I suggest the same system. We may be ld that we should employ our own detectives, but this is nearly ossible; there are few coolies who would be true to their salt nder the circumstances. Government may meet with a certain ount of success as a grudge is seldom borne against a man who tects crime in the *bonâ fide* discharge of his bare duty, but none of r people would take the work meaning to carry it out honestly, for ould of necessity lead them into quarrels and feuds with their tected neighbours which no man will enter into willingly on behalf another, in a country which has the reputation this Mulnaad has r devil-putting and poisoning, both very serious matters to the ordi- ary native. Kindly remember, gentlemen, that I have been able to avel very little in the district, and therefore my remarks can only e held to cover estates immediately under my notice; I hope you ill give your careful attention to all I have said and criticise or sup- port me as your local experiences may dictate, in order that the onorary Secretary may feel fully qualified to deal with the matter any time, and while apologising for detaining you so long, I earn- tly beg you to give him the benefit of your opinions.

Several members including Messrs. Anderson, W. L. Crawford, icke, F. M. Hamilton and Stewart spoke on this subject. Finally r. Harris remarked that he agreed with Mr. Hamilton's proposals egarding coffee passes, but was strongly opposed to all crops being bject to being estimated by outsiders. This was inquisitorial, and ight if an unnecessarily low estimate were made compromise the wner's position with his agents. He also deprecated asking Govern- ment for a further addition to the Police force at present, as a con- siderable increase had just been made to the Mulnaad body. He roposed, and Mr. Eicke seconded, the following resolution:—"That is meeting begs to thank the President for his exhaustive paper

on the subject of coffee stealing; but while agreeing with him as regards his proposal relating to passes, it prefers not to commit itself to a scheme involving a general estimating of crops without further enquiry, and deposes the Committee to draw up an elaborated scheme on the lines the President has suggested." *Carried.* Mr. T. Hunt drew attention to the objectionable custom on the part of the police of asking for presents, and Messrs. R. A. Anderson, J. G. H. Crawford, and F. M. Hamilton supported him in this statement.

Forest Laws.—Mr. T. Hunt said that as the local Government had informed him that they intended to carry out the Forest Rules regarding the clearing of jungle within 50 yards of stream, he begged to propose that the matter be taken up by the Association, and that a strong protest be made against the enforcement of these regulations. Mr. Horne seconded the proposition, which after the Honorary Secretary had mentioned that he had by no means lost sight of the matter, was carried.

Roads and Communications.—Mr. Daly drew the Honorary Secretary's attention to the bad state of the Gonibide-Belur Road between the 6th and 8th milestones. Mr. Playfair endorsed the Honorary Secretary's remarks regarding the Anjur bridge, and requested him to move Government to sanction its construction. Mr. Sladden, while approving of the Honorary Secretary's remarks regarding the Saklaspur-Chickanhully Road, expressed a hope that early attention would be paid to the completion of the bridges.

Railways.—Mr. Playfair said that though he considered the fact of the Durbar having applied for sanction of a line from Arsikiri to Hassan as satisfactory, he regretted that they had not proposed extension as far as Saklaspur. He moved (1) that this Association highly appreciates the wise policy of the Durbar regarding Railways, and respectfully solicits them to seek sanction as early as possible for the extension of the line from Arsikiri to Saklaspur, and further to use their utmost endeavours to obtain sanction for the construction of the line thence to Mangalore. (2) That this Association begs to tender its best thanks to Mr. Graham Anderson, C.I.E., for the amount of information regarding the proposed Arsikiri-Mangalore Railway he has collected and placed at the disposal of the Association. Both resolutions were carried unanimously.

Cardamoms.—Mr. W. L. Crawford said "that for the last ten years our Association has been doing its best to get Government to reduce the cardamom assessment to a uniform rate of 8 annas per acre on ghaut lands owing to the large proportion of rock and uncultivable land that is mixed up in the blocks. Many reminders have been sent to Government without any apparent result. Several promises have been made of an early and favourable settlement since the visit of the late Maharajah, but so far little or nothing appears to have been done. I therefore move that another representation be made by the Honorary Secretary to the Durbar urging an early settlement of this long-standing grievance. Seconded by Mr. Playfair, and carried.

Rules.—Mr. Elder proposed and Mr. Limouzin seconded, "that officials residing in the coffee district may by acclamation be elected honorary members of this Association." *Carried.*

Local Officials.—Mr. Elder said, "an excellent example has been set us by the Nilgiri and Wynaad Associations who have invited certain of the District officials to become honorary members. I therefore beg to propose that the Honorary Secretary be asked to inquire if Messrs. Weir, Bowring, Rice and Davy will join our Association as honorary members." Mr. R. A. Anderson seconded the proposition, which was carried unanimously.

Mr. Horne thought we were to be congratulated on Mr. Bowring's appointment to Saklaspur, but he was only Assistant Commissioner. In so large and important a district as Hassan, with so many European residents, he would like to see a European at the head, and he begged to move "that this Association fully endorses the opinions expressed by the Honorary Secretary in his report under the heading 'Local Officials,' and requests him to bring them to the notice of Government at an early date." Mr. Crawford seconded the proposition, which was carried.

Circulation of Papers.—The Honorary Secretary drew attention to the inconvenience that was caused him by the papers being so long on circuit, which rendered it difficult for him to carry on correspond- ence. He proposed, however, continuing the meetings of the sec- tions, but would ask each Committee man to return the papers to him after his meeting had been held, and he would forward them on to the next section,

Burning of the Palace at Mysore.—Mr. R. A. Anderson said he felt sure that all present were anxious to show their sympathy with the Maharanee, and he moved "that this Association has heard with the greatest regret of the disaster that has befallen the Royal family of Mysore, and begs to tender an expression of deep sympathy with the Maharanee and other members of the Royal family." Carried unanimously.

The President in his closing speech began by commenting with some severity on a certain amount of persistent disorder which had prevailed amongst a small section of the large meeting on the first day. He also reproached those subscribers to the U. P. A. Fund who had not paid up their donation, and said he thought they were acting in an inconsiderate manner towards the Honorary Secretary. He then went on as follows:—You have received an appeal for help for the suffering; and hardly as the people of S. India may have treated you, all resentment must be laid aside and you should send your mite to save the lives of people whose failings and prejudices are so great that in many cases it is with difficulty that they can be induced to accept help. The planter from of old has had the reputation of being an open-hearted and open-handed friend of all in distress; do not now allow that reputation to be imperilled by selfish considerations. This has no doubt been a year in which our losses have been very serious, but we are not yet hopelessly bankrupt, and I trust all will spare at any rate a trifle. I am not asking for large sums; let those who can afford them give them, but to one and all I say "Give now." Give Rs. 10 to-day if you have it with you, it will be better than a promise of Rs. 15 later on. Give Rs. 5 a month if you can, or Rs. 2 or 3 if you cannot, but anyhow open your heart and purse to give. Gentlemen, you have passed a Resolution of which all must approve most truly, sympathizing with the Royal family of Mysore in the loss they have sustained by what at present we have reason to fear is the total destruction of their historic home. We planters of Mysore put the Maharanee of Mysore second only to our Queen in our affections, and the most thoughtless cannot fail to feel the sorrow which Her Highness will experience at such a calamity, for the intrinsic loss we need feel no regret, but it is quite impossible to reconstruct a home with all its associations. I am very glad that you have given public expression to your sympathy. The Secretary to the U. P. A. has circulated for approval the following address to H. M. the Queen-Empress to express our congratulations, if I may use such a familiar term, on the completion of a reign which is in every good sense a record. (Draft address was here read and received with applause.) I think the address expresses everything that I need say, and I will only therefore express my entire approval of the idea and of the action of the Honorary Secretary who has approved of it and suggested Rs. 500 as the approximate amount he thinks should be spent on a suitable casket. Gentlemen, I have now the honor to resign my office and beg that you will proceed to elect the officers and delegates for the coming year.

Election of Office-Bearers.—A vote of thanks to the retiring executive was carried *nem. con.* and Mr. J. G. Hamilton was elected President, Mr. J. A. Harris Honorary Secretary, and Mr. J. G. H. Crawford Vice-President and Committee man for Section No. 1; Mr. Horne Committee man for Section No. 2; and Mr. W. H. Scott Committee man for Section No. 5. The proceedings then terminated.

SHORT STORY.

PLANTING SONGS.

SOMEONE has asked us to start a "Poet's Corner," and by way of beginning sends us a well-known Ceylon planting song, which we give below. It is decidedly applicable to a few of our South Indian districts. We shall be glad to get similar contributions from our readers:—

HERE'S TO TEA.

(Air: "JOHN BROWN'S BODY.")

I.

In the good old days there were no V. A.'s,
No kanaks to bother your soul,
But you picked your crop and worked the shop
With never a big check roll.
From early morn to dewy eve,
If you'd got crop in the store,
No peace you knew till your crop was through
And you were free once more.

Chorus.

Singing, glory, glory, Hallelujah,
Here's to the firm that doesn't screw yer,
Never sends a V. A. to yer,
As we go planting along.

II.

We fought the bug, both black and green,
With lots of good manure,
But jungle rats, we've got no cats,
And borer we could not cure.
But we made it pay in a quiet way
To the tune of five thous. a year,
Till a fungus came with a horrid long name,
A thing to dread and fear.—Chorus.

III.

Oh, next Cinchona was the rage,
'Twould save us all, they said,
'Twould mend our broken fortunes,
And make us rich instead.
Men talked of Calysayas,
And Officialis too,
Till a canker came and killed the trees
And nearly killed us too.—Chorus.

IV.

Oh, crotons, cotton and rubber
We've tried, but they do not pay,
And cardamoms and cocoa are
But good in a quiet way.
So there's only one thing left to us,
To keep us from the wall,
So here's to Tea, good old Bohea,
And here's to the flush so tall!—Chorus.

V.

Then it's: "How are you off for labour,
And how does the flush come in,
And are you short of withering space,
And rolling still like sin?
Or do you roll it lightly,
Ferment it not at all,
Fire at a hundred and ninety
With a view to prices tall."—Chorus.

VI.

In the good old days
King Coffee ruled the roast,
We've rung the changes all around,
And tea is now the toast.
Oh may you get rattling prices,
And may they never fall,
So here's to Tea, good old Bohea,
And here's to the flush so tall.—Chorus.

HE DID NOT GO TO AUSTRALIA.

NOTHING is easier than to recommend a man to go to Australia. A dozen words or so out of your mouth and you have done it. But for him to act on your advice—that is a gray horse of another color.

our. You see, Australia is half-way round the world; and to pull stakes here and go there—family, interests, and all—is a job no man takes in hand save for the strongest sort of reasons.

Yet that is what Mr. Emrys Morgan Price, grocer and tea merchant, of Trehafod Road, Hafod, S. Wales, was advised to do by a doctor at Merthyr. Now, we don't say but that the result, if Mr. Price had gone, would have proved the doctor's judgment to be sound; but as it happened Mr. Price came out all right in the end. The facts are briefly these: In August, 1881, the customary agricultural competition took place at Abergavenny, and Mr. Price attended. In some way—he fails to state how, and it doesn't matter—he took cold and had a chill. When he arrived home at Dowlais he could scarcely breathe. To draw his lungs full of air was quite impossible. In fact, he felt as if he were suffocating. Of course, there was no more thought of singing; the question was one of getting breath enough to live on. He at once tried that good old-fashioned remedy, mustard plasters, putting them on his chest and perhaps on his back between the shoulder blades. They relieved him for the time, as we might expect. But mustard plasters do one thing—no more. They draw some blood from the inflamed parts to the surface; that's all. When they have set up a bit of mild counter-irritation they are done; they don't get down to deep uses. And here there was a deep cause. We will point it out. There was a constant whistling noise in his throat, he says. You hear it in children when they have croup. It means that the air passages are contracted and the breath has to pass violently through small orifice. Disease has often strangled people to death that way. "Next," he says, "a violent cough set in. I coughed and this meant more and worse inflammation, and shows us the spectacle of Nature trying to get rid of the product—the phlegm or mucus. But to cough night and day! Think of it. What becomes of a man's appetite and sleep? You can imagine. No wonder the doctor at Merthyr was anxious and suggested a change of climate.

Still, Mr. Price, as we have said, remained at home and consulted his physicians, one at Dowlais and one at Hafod. All the doctors agreed that their patient was suffering from acute bronchitis, and very properly treated him for that. Yet somehow their medicines failed to effect any real and radical good. That they were temporarily helpful we may not doubt. But, you see, bronchitis, once seated, is an obstinate and progressive ailment. It has a tendency to take to new ground and to get down on the lungs, the reason being that the lining of the air passages and of the lungs is all one thing. So an affection of any part of it, if not cured, spreads like fire in dry grass. "As time went on," says Mr. Price, "I got weaker and weaker and my breathing became distressing to hear. All my friends thought I was in a consumption, and as a sister of mine had died of that complaint, I naturally felt alarmed. Indeed, one night in July, 1885, I was so bad that my wife thought I was dying."

Happily the lady was mistaken, yet death sometimes comes with awful suddenness in that complaint, and her fear was very reasonable. At that time, please remember, our good friend had suffered about four years, and was in a state of low vitality. The whole body was feeble and exhausted, and there would have been nothing surprising in a fatal termination. But a better result was in store,

Mr. Price's letter, dated August 16th, 1893, concludes in these words: "Better and worse I continued in the power of this malady year after year, and had given all hopes of ever getting better. In February, 1887, after having endured it 5½ years I read of a person at Pontypool having been cured of the same thing by Mother Seigel's Curative Syrup. I got a supply of it, and in a few days I felt relief. I kept on with it and gradually improved. In six months the cough had left me and I was a well man. Since then I have been sound as a bell. If you like you may publish my statement and I will gladly answer any inquiries. (Signed) Emrys

Good! That is pleasant and cheering to hear. One word—an important word. Bronchitis, pneumonia, rheumatism, gout, nervous disorders, liver complaint, kidney trouble, and most of our familiar diseases are caused by poison in the blood; and the poison is produced by stomach fermentation, indigestion, and dyspepsia. Consumption itself comes in the same way. Mother Seigel's Curative Syrup drives out the poison and stops the manufacture of more. That's why it cured Mr. Price and will cure anybody.

"PLANTING OPINION," COONOR.

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Trichy Phosphates.—90 % guaranteed to pass through sieve, 1,000 meshes to square inch.

Sun-dried Fish.—Either whole or milled, guaranteed free of sand.

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 60 ft. by 3 ft.

Quotations and further particulars will be furnished by our Tellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, MAY 15, 1897.

[No. 10.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 28th May 1897.

Central Travancore.

Every available cooly on plucking. *General Health*.—Good. *Labour*.—Somewhat short.

Nilgiris.

SHOLUR, 9th May.—Since last report, lowest and highest temperatures between 6 A.M. and 6 P.M., 57° and 81° respectively. Rainfall from 1st January to date, 7.09. Tea flushing very freely. Labour plentiful, but a good deal of sickness amongst Badagas and Canarese children. Grains in the local bazaar becoming cheaper.

Coorg.

POLLIBETTA, 11th May.—*Weather*.—Sun very hot. Hardly any signs of rain beyond thunder and lightning in one or two directions on one or two days, and just a few drops on one day last week. A Scotch mist on last night. A perfectly cloudless sky to-day with high East wind, which means that the much-needed rain is deferred for some time longer. *Crops*.—All berries left of the first set are

coming on after last showers. Rain required to bring on berries of last set which appears to be fairly good in parts. A feeling seems to be gaining ground that crops have been under-estimated; that they won't be quite as bad as was at first feared. *Plant Diseases*.—Excepting that some borer is showing up, coffee generally is looking healthy. *Labour*.—Coast contractors beginning to put in an appearance, but work generally held in abeyance for want of rain. *General Health*.—Fevers prevalent.

S. E. Wynaad.

PUNDALUR, 11th May.—*Weather*.—1st, 2nd, 8th and 9th inst. we have had very heavy rains, followed by heavy winds, and since every evening very cloudy. Grain is very dear. I do not know why the rates are equally charged for wet and dry lands without any distinction. Coffee, cinchona and tea are cultivated on dry lands and are permanent cultivations, and so the rents charged on dry lands are bearable. The paddy and other cultivations are temporary cultivations half of the year; the wet lands are cultivated and half of the year are lying vacant, and when the case is such, the rents are equally charged and unbearable on wet land. Since the Revenue Settlement came into Wynaad, the cultivators have got very poor and are living from hand to mouth, owing to the high charges of rents paid to the Government and jenmabogham to the Jenmis. Owing to this the cultivators have relinquished many portions of lands and thereby caused loss to the Revenue Department. Very likely the Government may think that it is the fault of the cultivators for not ploughing, deeply manuring, weeding and watching. I have tried three years successively with Mysore, Coimbatore and Palghat cultivators with this trial, the paddy grew more luxuriantly and fell down and got 10% paddy and 90% husk, and thereby suffered heaviest losses for the three years. A cultivator is always very avaricious to cultivate and store at least one year's good supply of grain for his work people and family; with this anxiety he works throughout and yet he can't get it, and I will repeat once more the Honorable Mr. Rees' words pronounced at Calcutta: "The agriculturists are poorer now and more highly taxed than they were in the good old times." Worse in Wynaad I can say. The paddy fields in Wynaad are entirely surrounded by jungles, and owing to this the wild beasts and birds are the worst enemies; also to prevent this, the "Arms Act" is in the centre. Land owners who are pay-

ing rents above Rs. 20 should be excluded from "Arms Act" which will be a blessing from the Government for the troubled ryot. From next fusli and as a mark of the sixtieth Reign of our most beloved Mother and Queen, I would advise the Government to consider the above and reduce the rents on grain cultivations, charging differently for Government and jenmi lands and exclude the ryot who is paying a rent above Rs. 20 to the Government from the "Arms Act." The present District Magistrate did a wonderful and charitable work for the poor pariahs in Chingleput while he was in charge of that district; and when he was as Head Asst. Magistrate, Nilgiris, some years back, he was a very strict master for the officials, and did some good also to the public by going into the shandy bazaars in Wynaad and noticing the merchants who were using false weights and measures; in like manner, I trust that this will get into his hands and that he will consider and do some good for the ryots, and then there will be plenty of lands taken up and the revenue increased.

GENERAL NOTES AND ARTICLES.

PROFIT SHARING.

EACH year the labour question seems to develop new difficulties in the planting districts of India and Ceylon. Any attempt to solve, or even partially solve the great problem, is worth attention. Yet we fear the very novelty of the subject of this article: *i.e.*, how to devise a method of rendering the interests of plantation labourers identical with that of their employers, will arrest less serious attention than it undoubtedly deserves. It is a very old and sound text our remarks are based on: if you want a man to take a real interest in your business, make him a part of the concern: there is no interest greater than self-interest.

Profit sharing has been attempted on some Straits Settlements estates, and with, we understand, excellent results. There is no obvious reason why something in the same line should not be attempted in India. We have but sketched the roughest of outlines of the scheme, it needs careful thought and experiment to put it on a practical working basis.

In the March number of the *Hawaiian Planters' Monthly*, the organ of the "Hawaiian sugar planters' association," appears a very interesting article on the above subject by the Hon. Mr. P. C. Jones.

Mr. Jones discusses the labour question very thoroughly and shows not only what is being done abroad in establishing mutual co-operation in large enterprises, but the advantages of introducing the system in the Hawaiian Islands, and thereby providing a more intelligent and permanent population.

Various methods have been tried at various times in farming, mining and manufacturing, by which the labourers have to a greater or lesser extent participated in the profits of the business. There are objections to this in agriculture, as it does not encourage the farmer to make improvements: time wages, piece work, and quality prizes,

percentages on sales, etc., have all been tried with more or less success but do not quite touch the subject.

Mr. Jones quotes two letters from sugar planters showing how the system has worked on the estates in their charge. The first letter is from a Mr. D. W. Goodall, of the Onomea Sugar Co., Papaikou, Hawaii, who purchases his cane from his men by its estimated weight. The second letter is from Mr. Wm. Kinney, late Manager of the Honomu Sugar Co.

Mr. Goodall, on behalf of his firm, gave out contracts to one of his men thus: The planter (as the cultivator—Chinese, Japanese, or what his nationality might be, is called) was paid a stated sum per acre for the plot he cultivated, with a proviso for a bonus on the yield if it exceeded 4 tons cane per acre, and a forfeit if the yield fell below the four tons per acre. The result was in a way satisfactory. The yield was in excess and a bonus was paid the planter by the Company.

Mr. Goodall mentions another contract made with a Japanese gang, by which he paid a stated sum per ton of cane delivered alongside the flumes. The result was altogether satisfactory, as the men made from \$3—\$10 per month more than they could have made by plantation work (time wages). The cane was as cheap and the fields were as well kept.

With the Japs and others who raise cane in small lots he has no contracts, but his system is as follows;

Any man who wishes to raise cane is given the free use of land in ravines or on side hills too steep for ploughing by animals, or small outlying patches, etc.

The planter clears the land, prepares it for planting by hand, plants it with seed which he gathers from the Company's fields free of charge.

When planted he cultivates it, cares for it to maturity by his own labours or that of other men whom he may hire. When ripe or at a time convenient to the Company, the cane is cut, weighed and carried to the flumes by the Company free of charge to the planter. Cane grown thus commands \$3 a ton.

The cane is grown in patches of from quarter of an acre to 3 acres, and comes in in lots of from 10—200 tons.

The work is done in the men's spare time—evenings, holidays, and to a certain extent on Sundays; so it is hard to get at the actual cost to the planters, but it is said to pay well, and the land is eagerly taken up.

Other contracts Mr. Goodall has, but they are much the style as the above.

Mr. Kinney works somewhat differently. On his Com-

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

pany's land, the planters are usually paid so much per clarifier of juice. A clarifier of juice is 500 gallons without maceration water, that is, \$8.40 per ton of sugar or 90 cents per ton of cane. This is for cultivation only. The Company has nothing to do with cleaning the ground, procuring seed, planting or harvesting. The price the Company pays is 3—6 dollars per clarifier.

There are other contracts—covering, planting and harvesting, and still others that cover everything from felling forest to delivery of cane alongside flume. Acreage of a gang of planters generally varies from 30—80 acres. Earnings per man are rather more than day wages. When a field is to be given out there is usually competition, which shows they like this way of working.

By usage or dastur as we say here, many things are understood which are not mentioned in the contracts (1) for bad work, slothfulness, harbouring deserters, cheating in the day's check roll or having a disorderly camp, the contract may be cancelled.

(2) Exchange of work. Sometimes the best gang get behindhand, then the Company lends time labour. And later when the Company with its daily labour gets behind and the gang is abreast of its work, the Company borrows labourers from the gang till the account is squared.

On the whole Mr. Kinney finds this system of work pay. Yet it is not the system which could be brought into operation with tea; for though doubtless we could get the leaf to the factory in good condition and yet keep the estate properly plucked and worked if we gave the various fields out on contract, yet we should have the leaf coming in very irregularly, sometimes in dribblets, sometimes with a rush, and tea leaf cannot wait like cane without very rapidly spoiling.

Yet there is a way by which all might participate in the profits and which would, I fancy, do much to attract a good class of labour. Of course it would take some time to make them understand the principle of the thing, but I think that as soon as Ramaswamy and Karapie found that if they worked well and steadily all the year round they would, if the estate paid, receive a santosum, they would work better and more intelligently than they often do at present. Now they have no incentive to work better than the usual average, and for this reason: "the master," they say, "is contented with so much work per diem; if any one of us goes and does better, he'll keep us up to the higher standard of work; good for him, but bad for us." Now if they understood that their best work meant not only Rupees in the master's pocket but a proportion of pies in their's. I think it would be a great incentive to them to do their best.

On an estate managed by the proprietor, I would suggest that at the end of the year 5% of the profits went to the labourers in addition to their wages. No coolie who had

worked less than 20 days per month or been on the estate less than 6 months should get any bonus. Those that had worked over 20 days a month, and had been on the estate for over 6 months, and the writer, should be paid shares out of the bonus in proportion to the total of their wages.

If the estate is not managed by the proprietor but by a manager he should be paid 5% on the profits as well. For example: Utopia estate pays well and the proprietor lives at home, but the paying condition of the estate is largely due to the excellent and hard working labour he has collected on the place. He would never have got such a manager and such coolies had he not treated them liberally and allowed them to share his prosperity. This he does by setting side 10% per annum to be divided amongst his manager and the coolies. No coolies are entitled to a share till they have been a year on the place, and to gain the bonus they must work at least 200 days per annum or more.

The profit is for last year	...	...	...	Rs. 30,000
5% is given to the manager	...	...	...	" 1,500
5% is divided amongst the coolies, writers, &c., according to their pay. The more they pay the larger in proportion the bonus	...	...	...	" 1,500
				<u>3,000</u>

The tea house writer's pay is ... Rs. 300 per annum.

The maistry's pay is ... " 180 "

50 men coolies have worked 10 months of 20 days or more and each averages Rs. 66 per annum ... = " 3,300

50 women coolies have worked 10 months of 20 days or more and each averages Rs. 48 per annum ... = " 2,400

Rs. 1,500 ÷ 6,180 Rs. 6,180

Pies 288,000 ÷ 6,180 = 46.44 pies per Rupee of wage.

This represents 5% on the total profits, and being only paid to the most reliable of the coolies comes to a nice sum each, besides being a good object lesson to the balance.

The bonus will be in this case Rs. 1,500 ÷ Rs. 6,180 = 288,000 ÷ 6,180 = 46.442 p. per Rupee (the unit).

The tea house writer will have 46.44p. × 300 = 72-9-0

The maistry will have 46.44p. × 180 = 43-8-7

50 men coolies will get on an average 46.44p. × 66 = each Rs. 15-15-5 = 818-2-10

50 women coolies will get on an average 46.44p. × 48 = each Rs. 11-9-9 = 557-4-0

1,491-8-1

Difference owing to inaccuracy in decimals placed to credit of estate = 8-7-11

1,500-0-0

Manager's 5% = 1,500-0-0

Total 10% on net profit 3,000-0-0

If the coolies 5% was divided amongst all the coolies each would get a trifling sum; taking the best only, they get a sub-

stantial bonus; it should be a powerful inducement to do good work.

To sum up. We would advise the prevailing system of wages and kanaks to remain absolutely unaltered at least until such time as the labour force has thoroughly recognised the advantages accruing to them from the new departure. Once this understanding is established, the apparent direct loss of a small fixed proportion of the profits will be indirectly recouped in many ways. First and foremost will be the permanency of the labour force, resulting in itself in the work being done by trained and experienced coolies. Secondly, the work will be far more thoroughly done, as every hand on the estate will have a direct personal interest in the results of his or her own work. We have confined ourselves strictly to the business aspect of the question, and we disclaim being actuated by any philanthropic motives whatever. Yet sentiment being, even in business, a factor of no mean importance, the humanitarian side of the problem should appeal to no small section of our readers.

Cocoa and the brokers.

Some weeks ago we had occasion to point out how the price of coffee, among other products, could be sensibly raised by direct sale to the large grocers, instead of through the usual channel of public auction. This is what the *Produce World* says on the matter as regards cocoa: "In proof of what we have written in previous numbers that there surely remains yet something to be done in the matter of bringing the planter and consumer more directly into touch with one another, it may be noted that a company has lately started with the idea of selling to the consumer at the lowest possible prices, reports that they have been successful in placing among other articles cocoa at the rate of 84s. to 85s. per cwt. of identically the same quality as that which has been offered and sold at the public auctions in Mincing Lane at as low a figure as 50s. Undoubtedly there are many difficulties the company referred to will have to encounter before they are able to get this method of trading into an easy style of working. It nevertheless shows quite clearly that the middlemen are to a very great extent to be dispensed with entirely, and we beg to tender our heartiest congratulations to the company in question on their new method of sale."

SHIKAR NOTES.

Tents.

When after shy game such as Ibex or Markhor, it is a great mistake to use white tents. They can be seen miles away, and will often frighten shy game into the next nullah before a shot is fired. Another fault is to camp too near the ground which the game frequents. Camp 3 to 4 miles away and move up one's bedding and food to within a mile and a half of your hunting ground and sleep out for a night or two under a rock or tree, and use as little fire as possible. Start in the morning before daybreak and by the time you can see a hundred yards, you should be above your game. After this

it is merely a question of sharp eyesight, patience and straight shooting.

Colour of clothes.

Few men realize how much depends on the colour of their clothes in shikar. Down here in the South I suppose the best is the green Cannanore cotton shikar cloth. In the Central Provinces a reddish khaki is best. Up in the North, in the plains the soil varies from red to greyish, and you must match your clothes accurately to the colour of the soil, or your bag will be small. But it is in the Himalayas that you must be most careful. There the usual colour is a reddish grey of various shades. A white puggree or indeed any prominent colour, and your game will spot you miles away across the nullah in that clear air. Of course the colour varies a great deal. There is a hill up Gilgit way where you must wear black, or nearly black. In fact match the rocks that strew the hill. Up in Lodak a dark brownish grey is best. In Cashmere itself usually a darkish neutral grey is best. But in the early autumn when the grass slopes turn reddish yellow, a light reddish yellow is necessary. If you have got the right colour (the under fur of a red hill fox is a good tone to imitate) and keep still, game will feed right up to within twenty yards of you, without suspecting your presence, provided the wind is right. In the Hills everyone wears "puttoo", the natural-coloured woollen cloth of the country.

Grass shoes.

These are worn by all the village people in the Himalayas. They are made of rice straw, willow-bark, wild indigo fibre, or cotton rope. Those made of rice straw are the commonest. Next come those of willow-bark; those made of indigo are not so common; the cotton ones are little used, as though they are the best they are the most expensive. The shoe is a woven sole of rope, with loops at the side and a loop that passes between the first and second toes. A piece of rope, the continuation of the sole of the shoe, passes to and fro across the foot and through the loops, holding the shoe firmly to the foot. With the grass shoe must be worn a special knitted sock with the big toe separate; over this comes a sock of the same shape made of puttoo, flannel, or leather and lastly the grass shoe or sandal. This shoe is indispensable for shikaring over bad ground, as it gives a most wonderful foot-hold, and with it also one can walk almost absolutely silently. It has a further recommendation in that a pair of rice straw shoes can be turned out in 15 minutes by any hill coolie at a cost of one or two pies.

They would be excellent for stalking the Madras ibex of the rocky hills of the Koondahs. Anyone wishing to get them could do so by applying to Cockburn's Agency, Srirangur, Cashmere, at a cost of 14 annas a pair for the cotton shoes, and a rupee to one eight for the puttoo socks.

Rifles.

Every man has his own ideas on this subject and few can get hold of quite what they want. My own battery at present consists of a D.B. 500 express, a D.B. 12 bore rifle and a D.B. shotgun that takes ball as well, and a rook-rifle. But this does not represent my ideal battery by any means. That would consist of a pair of heavy D.B. 577 Magnum express rifles shooting a heavy express bullet with a small hollow in front. Cogson and Harrison, London, are now advertising these bullets. A pair of 450 Magnum express rifles to take the

avy bullet as above. A single barrel Martini-Metford to
ke the '303 cartridge and the Dum-Dum bullet, and a 12
re shot gun for small game, but which would fire ball out
both barrels. The two '577 rifles should suffice for all
avy or dangerous game, such as elephant, tiger, gaur,
ar etc. The two '450 rifles would be ample for deer of all
nds and wild goats. A pair of rifles of the same bore are
variably of more use than a pair of different bores, as the
tridges can't get mixed and at dangerous game, two shots
ometimes fail to stop. A shot gun is always useful, and
e little Martini '303 rifle, which should only weigh
bs., will enable you to get in many a long shot that other-
se would be missed. It should always be ready to hand,
her carried by oneself on one's shoulder—it is so light
at it does not tire you—or close to you by a good coolie.
fact you should never stir without it. For if properly
ed you can kill anything with it from a squirrel to an
ephant.

RHEA FIBRE.

Ceylon.

A good deal of attention has been
attracted in Ceylon lately to the cultiva-
on of Rhea, and on March 8th last we published an article,
ys the local *Times*, stating how matters then stood with regard
the industry, and to the Syndicate which had been formed to
arry on the cultivation of Rhea fibre on a large scale in the low-
untry. In another column to-day the subject is continued,
nd the announcement made, we regret to say, that the local
hea Syndicate is to be voluntarily wound-up, the prospects
efore it not being such as to justify its continuance, as the
tainty of prices continuing remunerative for its product is
ery slight. The cause of the feeling of insecurity on the part
of the Syndicate is that it has no guarantee that the prices paid
for the first shipments of Rhea ribbons will be maintained.
efore the articles manufactured from Rhea fibre can be turned
ut, as we have already pointed out to our readers, Rhea has to
ndergo a variety of processes. The mere stripping into ribbons
only one part of the trouble; the remaining processes are
that the Rhea Fibre Treatment Company have taken out their
atents for and at present hold, in a way, a monopoly of. It
an easily be seen that, as their supply of Rhea ribbons increases,
hey have it in their power to reduce prices, and in this way the
ultivator might in the course of a few years be forced to sell
is ribbons at a loss. Capt. Whitley, doubtless, had this possibi-
ty in view when he wrote out that he was prepared to make
contracts for regular supplies. At present the Rhea Fibre
reatment Company find ribbons scarce; the cultivation of
hea grass has not been largely taken up yet; and we believe
hat suitable ribbons put on the market now would command as
uch as £20 a ton. But that that figure stands little chance of
eing maintained there is good evidence of already. The local
yndicate was originally offered £16 a ton for its produce; now,
aptain Whitley only holds out a definite offer of £10 a ton,
with a hint of a slightly increased price for early shipments,
nd from £16 to £10 is a long drop. Then, the Rhea Fibre
reatment Company in their annual report, which was sub-
mitted at the annual general meeting of the Company, held at
he Café Monico on March 31st distinctly state that their
egotiations with cultivators "have occupied a considerable
ime, and the Directors consider from the experience which they
ave gained, and with new sources of supply opening up, they
ay reasonably anticipate a reduction in the cost of the raw
aterial," and the Chairman of the Directors of the Company
Mr. W. J. Cordner) in his speech at that meeting, said:—
We have made contracts for the growth in and supply from

Brazil, and Paraguay, and the shipment of supplies from Ceylon,
the Straits Settlements, Singapore, Borneo, Java, Sumatra,
Mexico, Jamaica, Fiji, the Sandwich Islands, and the Pacific
Islands. All this has entailed a very considerable amount of
negotiation both personally and by correspondence, and in these
negotiations every care has been taken to make the closest and
best contracts, and *contracts which will admit of reduced prices
afterwards if necessary.* If no more has been done in the way
of cultivation in the other places named by the Chairman than
has been done in Ceylon, the Fibre Treatment Company are not
likely to receive an extensive supply of Rhea ribbons for some
time to come; but apart from that, in the face of such state-
ments as we have here put forward, one cannot be surprised if
Ceylon planters show themselves chary of taking up the cultiva-
tion of the new product.

The pamphlet compiled under the
A New Book on Rhea. direction of the "Rhea Fibre Treat-
ment Co., Ltd." contains most useful information relative to
Rhea of great interest to planters throughout India, Burma
and Ceylon. Samples are furnished of the raw material and
of the finished articles produced from the fibre by the Gomess
Process. First we have Rhea ribbons, filasee, sliver and dyed
yarn; then plushes, cloths and materials, some of them rhea
and silk mixed. These last are very beautiful and make one
wish for clothes made of them, so light, and of such fine texture
are they. Four well executed woodcuts are given. The first
illustrates the Rhea (*Bæhmeria Nivea*) plant as grown in a
clump; the second its leaves and its flowers male and female
and its seeds (natural size and magnified). The leaves, flowers
and seeds of the Rhea (*Bæhmeria paya* or *Maoutica paya*),
and of the Nilgiri Nettle (*Urtica heterophylla*) are similarly
pictured. The "Introduction" consists of an article on the
subject of Rhea entitled "A New Industry," extracted from the
Times of 10th August 1896, and an excerpt dated the 20th August
1896. A long list of authorities referred to in the compilation
of the pamphlet is given, followed by another indicating the
botanical names of the several species or varieties of the rhea
plant grown in various countries. Next we have the heading:—
"Nomenclature;" "Cultivation of Rhea—General Remarks on
Cultivation;" "Cutting and Gathering the Crop and Yield;"
"Stripping the Ribbons;" "Drying;" "Baling;" "Cost of
Cultivation;" "Short History of Rhea Fibre," etc., etc. The
brochure is a veritable *multum in parvo*; and those of our readers
interested in the subject and who purpose making trial of rhea
cultivation, would do well to procure a copy for reference and
study.

RUBBER CULTIVATION.

A VERY well-known Mysore planter, Mr. J. A. Harris,
asks elsewhere for information regarding the prospects of
rubber-cultivation by planters. Eager as we have always
shown ourselves to support the introduction of new staples,
we find it difficult to say very much in favour of rubber
plantations. In fact, considered as self-plantations, *i.e.*
gardens opened up wholly in rubber, the cultivation of this
product has so far proved the reverse of remunerative.
Almost everything depends on the varieties chosen, and
experiments with the best-yielding jats are too recent for
reliable information to be obtained. Interplanted in coffee
or tea at suitable elevations and in a congenial climate,
there might accrue, in time, profitable returns. Ceylon has
shown India the way, as in numerous other new products,
and an ex-Ceylon planter gives us the following informa-
tion on Ceara rubber, the variety most largely cultivated.
It may be mentioned, however, that it certainly does not

pay, and further that the most desirable jats are Para and Castillea, and the newer African rubber-vines. To return to Ceara. It is very difficult to germinate artificially, though in natural germination, i.e. from seeds dropped under the trees and allowed to spring up at will, huge quantities of seedlings may be gathered. The seed has a very hard shell, which may be filed off to hasten germination, but this is a very delicate operation, and results in a large percentage of failures. It was grown some few years ago near Kandy as a shade for cocoa, but proved of very little good, as the leaves all dropped in the hot weather. With the cold weather appeared a most luxuriant growth of foliage. Some twenty-five years must elapse before remunerative returns can be hoped for. Ceara is very liable to dry rot and white ants. Such being the case, as far as Eastern experience has gone, we print the following extract from the *Daily Mail* with hesitation, and should advise our readers to accept the statements therein with caution:—

A natural product costing 6d., and worth 2s. 4d., leaves a nice margin for profit, and is exactly what this great trading nation is looking for. A few years back, India rubber in large quantities could be bought from native collectors at 6d. per lb., or even less, but that halcyon time for the coast trader is over, and will never return. Everywhere the natives are very much alive to the value of rubber as a commodity; besides, they have to travel much greater distances for a supply than formerly was the case. To-day India rubber can be grown very much cheaper than the 'wild' product can be purchased, and, as might be supposed, the quality is far superior. Appliances can be made use of, insuring a product of even value, and worth at least 55 per cent. more than the mixture of rubber, dirt, leaves, and bark, prepared by ignorant natives, which is sold as "caoutchouc" at high prices on the Liverpool and London markets. It is this certainty of a greatly improved product, which makes the prospects of rubber-growers so alluring. Para rubber, which is coagulated on an excellent system, is worth 3s. 7d. per lb., and all that is required to make other varieties equally valuable is brains. Experts declare, and have proved that castillea rubber may be cultivated in any quantity at a cost of 6d. per lb. There is no difficulty about it, no expensive plant or machinery is needed, as in the case of coffee, cacao, vanilla, etc., and the risk of damage to the crop is practically nil. Hurricanes and tornadoes may blow, if they will, but unless they uproot the tree—no easy matter, with its firm and deep hold on the soil—they cannot hurt the rubber, which, in the form of sap or milk, lies perfectly secure beneath the bark. Having bought or leased the land, the rubber-grower may please himself about clearing it. This is not absolutely necessary. If he does not want any side-crops, such as bananas, coffee, cacao, or vanilla, all that he need do is to cut paths or lanes at intervals through the forest, and plant seeds, or saplings every fifteen feet or so. The castillea is a forest tree and

WILL THRIVE IN ITS NATIVE JUNGLE

just as well as on cleared and cultivated land. The best method, however, is to plant year old seedlings, raised in a nursery, on cleared land, in groups of two or three. If all thrive, the surplus ones may be taken up and planted elsewhere.

In five years from the sowing of seed, the young castillea, if planted in a favourable situation, will be 30 feet high, and the trunk at least 20 inches in circumference. It may then be tapped—that is, grooves are cut in the trunk and receptacles placed beneath to catch the milk which oozes from the incisions. The milk may be coagulated in various ways. The careless native, who is content to dig a small pit or basin at the foot of the tree to receive it, and with it all the bits of bark and leaves that chance to fall into the hole, does not put himself to much trouble. A common practice is to mix the milk with a decoction obtained by boiling the stems of a species of wither which partly coagulates it; then, having levelled a patch of ground say four yards square, he pours the whole over it. When the sun's rays have evaporated the moisture, and turned the rubber black, he rolls it up into sausage form, and in that shape sends it to the nearest trader. White men have improved vastly on that happy-go-lucky method, but, unfortunately, except on the few plantations, the white man seldom has the opportunity to exercise his skill. If he

attempted to supervise the methods of the natives by accompanying them into the jungles, it would be at the risk of his life. Collecting wild rubber is not an occupation for Europeans; in all ways it will pay them better to grow their own trees.

The five-year old tree, if well grown, will yield 2½ lbs. of rubber worth 5s. 3d. in England to-day. If the wounds are

FILLED WITH WAX OR CLAY

after the sap has ceased to run, no injury is done to the castillea which may be tapped six months afterwards, and once or even twice annually, for twenty-five or thirty years, or more. Every year for a certain period, the tree will yield an additional pound at no extra cost. A bi-annual weeding is all that is necessary.

British experts who have studied rubber growing in Central America and Mexico prefer not to tap the tree until it is eight years old. Nothing is lost by sparing it, for the eight year-old tree, never previously tapped, will yield on the average 5 lbs. of rubber worth 11s. 8d. at present values. An acre of land will support 200 trees, and the gross annual income from a 100 acre plantation, eight years old, may therefore be easily calculated; 20,000 trees, each yielding 5 lbs. of rubber, of the value of 11s. 8d., would give the fortunate planter a return of £11,666. Sir Henry Dering, Bart., C.B., H.M. Majesty's Envoy Extraordinary to the Republic of Mexico, in a Foreign Office report dealing with the productions of that country estimates the cost of establishing a 500 acre plantation of *castillea elastica* to the end of the fifth year at £2,708, and the net profit the same year at over £10,000. As these figures are based on a selling price for the rubber of 1s. 1d. per lb., and it is now worth from 2s. to 2s. 4d. it will be seen that there is plenty of margin for accidental losses, which never, however, seem to be incurred in rubber growing. A thievish native might come in the night and tap a few trees but, as he would have to wait for the milk to fill the hole he had dug, and for the sun to coagulate it into rubber, he would run a serious risk of being caught in the act. The fear of having his rubber stolen—a not very serious contingency—appears to be the only thing likely to vex the rubber grower's puriferous dreams.

There are already a few plantations in Mexico, one, La Esmeralda, is said to comprise half a million eight-year old trees. The tapping of these still shortly begin and the annual value of the product may be readily estimated on the basis of the figures given.

PHOTOGRAPHING IN TROPICAL AFRICA.

BY LIONEL DECLE.

THE following hints should be of distinct use to the rapidly increasing body of amateur photographers in our planting districts:—

Almost every traveller or explorer who visits Africa takes along with his luggage a photographic apparatus, but unfortunately very few succeed in bringing home a series of good pictures. Having myself considerable experience in photographing in tropical regions, I will try to give as briefly as possible the result of my experience. During a five years' journey round the world, I took nearly 4,000 photographs. More recently, when I crossed Africa from the Cape to Uganda, from 1891 to 1894, I took over 400 photographs. During these journeys I have tried different apparatus and have tested almost every brand of plates and films, and I have been able to determine what is the most useful outfit to be recommended to intending explorers.

Camera.—To insure success it is necessary to have a strong camera of the simplest make but powerfully constructed and abundantly supplied with brass bound—5 by 4 and half-plate are the most useful sizes. The camera should rest on a strong stand, so-called detective or heavy cameras being useless toys. The stand must be very strong, so as not to be shaken by the wind. Double dark slides should not be used as they invariably let in the light after some time. The most practical way of carrying plates is by using one of Hare's changing-boxes. I am actually using one that has already been three years in Central Africa and six months in Madagascar. It has been through more than 400 days of rain, and has never been out of order. Two lenses ought to be used—a rapid rectilinear and a wide-angle lens—both fitted with iris diaphragm.

Plates and Films.—I have tried both, and I have no hesitation in condemning films for tropical climates. It is a mistake to imagine

weight is of great importance in Central Africa. When you travel with a caravan, the average amount of luggage, camp material and trading goods required for a journey of twelve to eighteen months is from 8,000 to 10,000 lbs. A difference of 50 lbs. more or less is therefore of no consequence. The plates which I have found most satisfactory are Wratten & Wainwright's. Out of nearly 5,000 of which I have used I never found a bad one, and they stand heat and cold equally well. It is worth describing the extraordinary tests I have subjected them to. In 1891 I started from the Cape with three boxes of the plates. During six months they were carted about on waggon, being jolted in the most terrific fashion, but not a single plate was broken. In the Calahari desert I met with a mishap, and had to leave most of my goods behind me, proceeding with a few loads to the Zambezi. When I returned three months later I found that the plates containing my plates had been left in the open during all the time in the rain. When the case was opened the cardboard boxes were so soaked that they dropped to pieces. I dried them in the sun, and then tried some of the plates I was astonished to find that none of them were spotted and all of them were quite as good as before. In the two years following I took all my photos on these plates, and all the pictures turned out excellent. I must, however, recommend the ordinary (slow) plates. Using a Dalmeyer's rapid rectilinear lens with the smallest diaphragm, an exposure of two seconds can be made in the brightest sun, and the picture so obtained is quite soft and full of details.

Development.—If you want to obtain good results, it is necessary to develop the plates as you take them. This can be easily done by using a portable tent—a box covered with a dark cloth that you can round your waist. Fresh chemicals and great cleanliness are indispensable. The question of chemicals is a difficult one to solve—I only advise the use of pyrogallic acid and ammonia, especially with Wratten's plates. The solution with which I obtained the best results is the following:—

Pyrogallic acid	...	...	...	...	20 gr.
Water	...	...	...	...	2 oz.

Add to the above 12 minims of the following solution:—

Ammonia solution, '880°	...	...	...	1 dr.
Water	...	...	...	1 dr.
Bromide of potassium	...	...	...	8 gr.

Up to 20 minims of this can be added to the pyro solution, but have this amount there is great danger of getting a green fog. I find much difficulty in preserving pyro and in keeping ammonia from evaporating, but Messrs. Burroughs, Wellcome & Co. solved this difficulty for me. Their compressed "tabloids" of pyro can be kept almost indefinitely without turning black, and each "tabloid" being accurately weighed, a fresh solution can be made instantaneously for each plate. They also supplied me with '880 ammonia in hermetically sealed tubes, each containing 1 dr.—sufficient to develop up to eight plates. Messrs. Burroughs, Wellcome & Co. now manufacture a whole series of photographic "tabloids."

I would again insist upon the necessity for cleanliness. In tropical climates solutions get readily oxidised, and it is absolutely necessary, after developing each plate, to thoroughly clean the tray and the developer-glass. When the plate has been fixed, it ought to be well washed and then immersed for at least a quarter of an hour in a strong solution of alum. When taken out of the alum-bath the plate must be dipped in a basin of water, lightly rubbed all over with the fingers, and then washed over with running water.

To pack up negatives they ought to be placed face to face with a piece of paper between them. Each dozen is then tied up in a piece of paper, fastened as tight as possible with a small string, and placed in the original cardboard box. If the plates are packed very tight together, they are absolutely safe and run no risk of being broken.—*Chemist and Druggist.*

PINEAPPLES ON PLANTATIONS.

KNOWING how extremely well pineapples grow in parts of the Nilgiris, Wynaad and elsewhere, it certainly seems strange that no decided attempts have been made to extend their cultivation on a large scale. It will be seen from the interesting article below, taken from the *Produce World* that possible profits run up to £20 per acre in Queensland

There is no reason why, with our cheaper labour, results approaching these should not be obtained in India:—

A new industry, capable of indefinite expansion and requiring only ordinary ability and a modest initial outlay, is obviously the desideratum of many seeking for new financial pastures and fresh commercial fields. All around us the existing avenues of enterprise are being rapidly filled by competing capitalists or syndicates, and openings wholly new and easy to profitably fill are in increasing demand. Happily in our great Colonies there are still many openings, corresponding to the above description, which await only the advent of steady industry and a modest outlay to secure a regular and an increasing return. The great Colony of Queensland, Australia, is a conspicuous example of this fact; but in respect to many of the mercantile potentialities of this vast and generally very fertile region, absence of population, want of good communications, and a too prevailing ignorance of the facts in each case, have conspired to prevent up to the present time the successful exploitation of several promising fields for highly-productive industries which could very easily be placed upon a sure and permanent basis of well-assured profit for those combining industry, intelligence, and some amount of capital.

Unquestionably one of these as yet untouched sources is pineapple cultivation. This simply awaits the careful settler, and is a thing which, if properly organised and systematically pursued, should yield considerable profit. In a publication issued from the Queensland Government Press at Brisbane, we read that "Nothing surprises the horticulturist so much on his first arrival in the colony as to see those plants on which it has been usual for him to expend all his skill and ingenuity to induce them to thrive in the old country, growing with a luxuriance it was impossible for him to anticipate." A striking instance of this fact is furnished by the pineapple (*Ananas* or *Sativa*). In England, to raise pines to perfection, it is essential to have an elaborate plant and great skill, a considerable capital invested, and then the market is restricted to the comparative few. True, the prices obtained are high, but the prime outlay is large and the trade is not at all extensive. In Queensland, however, the pineapple flourishes like grass in the old country, and except the banana, it yields the quickest return after cultivating for market of any fruit grown in the colony. On the sandy ridges, or the red soils of volcanic origin found in Queensland, pines grow prolifically, and an allotment of, say, 100 acres, which can be obtained on almost nominal terms under the liberal land laws of the Colony, should yield a good return.

Allotments of this kind are required to be fenced; but timber is abundant, and a wire fence with wooden poles, the latter at, say, a pound a hundred, with 6s. per chain for the wire, is ample outlay for the enclosure. To prepare the soil properly for growing merchantable fruit should cost, say, £8 an acre, and subsequent final ploughing another 40s. per acre. Lines are then marked out, and the pine-suckers, having been prepared, are planted, and the bottom leaflets are removed to afford free action to the young rootlets. The planter picks out holes with a tool some four inches deep, and it is said a smart man can plant 500 suckers in about a day of eight hours. Three thousand suckers can be put into the acre in regular rows, and in the succeeding summer the stronger of the suckers will be bearing fruit. The following year fine fruit may be confidently looked for, and it is calculated in the authoritative paper published by the Government that 2,000 pines will be fit for market. The average market price is put at 2s. 6d. to 3s. per dozen. Thus a return of £20 per acre may be obtained. These figures have been said by some to be too large, but, allowing for this, it is clear that the return is very handsome. Should, however, the cultivator take extra pains in regard to weeding, and to careful selection of suckers, fruit fine enough to be worth 6d. each can be grown, and then the return is really enormous. In a few years, indeed, the plants become a solid mass, and the necessary paths are kept open by the use of the bill-hook.

Unlike viticulture, pineapple growing so far has been attended by no loss through disease attacking the plantations, and year by year the pineapple farm becomes more valuable. In the beginning settlers are advised to commence in an allotment of comparative small area, and then, aiming always at quality first and quantity afterwards, acre after acre should be added until really large crops of the best fruit can be secured. After the initial planting one man with a horse, a small plough, and a scarifier should be enough to keep ten acres in proper order. Probably a well-arranged plantation will keep in thorough working condition for twenty-five years.

Among the varieties of pines grown in the colony may be cited the following:—The Ripley Queen, which is described as first-class in every way, and having large fruit with fine flesh of excellent flavour. The Common Queen is very prolific, and of good average quality. Then the Smooth-leaved Cayenne is a strong grower, and a large fruit of capital quality. When really well grown this pine attains a weight of 10 pounds, and even 15 pounds. The Providence is likewise a strong grower, and yields a fruit of considerable size, but it does not bear so prolifically. Another notable pine is the Charlotte Rothschild, which yields a very large fruit, and besides these are other varieties.

There can be no doubt that pineapple culture, on a systematic basis, would be found a highly profitable industry in Queensland. Fruit-growing has been, on the whole, a much-neglected industry in the Colony, as may be easily inferred from the fact that so much has been imported—a thing eminently surprising when one considers how greatly are the facilities for raising some of the finest fruits in the world, either for home consumption or for export to the Mother Country. About the Mackay districts there are vast areas covered with wild pines, only waiting the careful hands of the cultivator to convert them into really merchantable produce. Then, too, there is the question of the fibre, as some experts think that wild pines might be made to yield fibres of no inconsiderable commercial value. At present quantities of pines are imported into this country, but, if only the splendid native pineapples of Queensland were improved by careful culture, they would certainly find in this country a profitable market, and would in all probability ere long hold the field. To bring this about needs but a comparatively modest outlay, and the taking up of, in the first instance, of comparatively a small area. One thing that should greatly encourage the Colonial cultivator is the fact that throughout the United Kingdom the consumption of fruit is on the increase, and that in a most remarkable manner. Fine Queensland pineapples, if placed regularly on the home market in really good condition, would most unquestionably command a ready sale, and at prices yielding a very handsome profit to the producer.

LETTERS TO THE EDITOR.

RECIPES.

SIR,—In reply to "Anglo-Indian," she will find all the recipes she has asked for, and many more, in the "Madras Cookery Book" by an "English Lady," published by Messrs. Higginbotham & Co. at a cheap price.

ANOTHER PLANTER'S WIFE.

OLD MYSORE COFFEE.

SIR,—In *Planting Opinion*, April 3rd, page 258, I find the following in an article on "Old Mysore Coffee" signed by Mr. Fred. D. Meppen:—"At that time there was perhaps no other place in India where such fine and venerable old coffee trees were to be seen as in the Mysore province. Many of the native gardens were much over a hundred years' old, in which may be seen coffee trees with stems from ten to twelve inches in diameter."

Can Mr. Meppen kindly state the exact locality where these coffee arabica trees are to be seen? Are the figures given the result of actual measurements, or merely estimated? And has Mr. Meppen any specimens (cross sections) of these fine trees?

5th May 1897.

ENQUIRER.

RUBBER.

SIR,—In view of the greatly increased consumption of India rubber, planters might possibly turn their attention with profit to the growth of rubber trees. Some ten or twelve years ago a considerable number of the Ceara species were put down in this district and grew well, especially in damp places, but this essay was not persevered with, as it did not appear that the trees when tapped would yield sufficient to make the undertaking pay.

But I am doubtful whether we had sufficient knowledge as regards the proper mode of tapping, and whether we gave the trees a long enough trial (ten years). Information is very much wanting, and it is on this account that I am addressing you, in the hope that you or some one else will come forward and throw some light on the matter. I understand that Messrs. T. Christy & Co., of London, recommend a trial being given to *Castilloa Elastica*, which they say flourishes in deep loamy soil, and being a deep feeder does not exhaust the surface soil. In cocoa plantations it is used as shade on account of its rapid growth.

CHICKAHALLY, GONIBIDE,
KADUR DISTRICT, MYSORE,
27th April 1897.

J. A. HARRIS.

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE,

SHENCOTTAH,

Tinnevely.

COFFEE.

The Market.

The enormous crops from Brazil have affected the prices of the lower class coffees most severely, while even the better grades have not entirely escaped the effects of the glut. Good Santos, for instance, was selling at 54s. to 55s. for "future" delivery in January: it has now fallen to 37s. 6d. to 40s. per cwt.

Bat Guano.

We understand on fairly good authority that there are large quantities of this valuable manure available in the Andamans. Without doubt huge quantities must likewise exist in caves all over India and in old Hindu temples. We trust soon to learn that the U. P. A. has applied to the Government for assistance in discovering supplies of this invaluable fertilizer. Roughly speaking its manurial value is just double that of the ordinary poonac.

Shade in B. C. A.

Coffee-planting in Nyassaland is in its infancy, and a vigorous childho it is. Especially in the fascinating style of paper controversy affected by those new hands who have scarcely seen a tree from seed to blossom. In discussing the shade question, some men display the greatest obstinacy about shade trees being of any use whatever. One writer condemns shade because coffee under plantains and Pride of India (utterly "impossible" trees, both of them) do not seem to thrive. It would be strange indeed if it did!

Coffee.

The coffee market has been depressed by the heavy outturn from Brazil. The downward movement in prices has been very severe, the kinds of coffee undergoing the greatest depression.

ation being those below 90s. per cwt., the lower the grade the severer being the fall, which in extreme cases has amounted to nearly 16s. from the highest point in January; good Santos, which was then worth 54s. to 55s. for "future" delivery, having recently been sacrificed at 37s. 6d. to 40s. per cwt.

Hawaii. In his annual report, the Hawaiian Minister of Finance estimates that the Hawaiian coffee crop for 1896 was 757,552 pounds. There are now upwards of two hundred and fifty plantations and estates devoted to coffee planting in these islands, and there is a fair prospect that the coffee product for the next few years will be doubled each year. If so, the crop of Hawaii for the year 1900 may be safely estimated at twelve million pounds. In the opinion of some sanguine coffee planters, this is a very moderate estimate. But it must be borne in mind that coffee, like sugar, is a very uncertain crop, and it is safer always to make low estimates.

WILD COFFEE.

SOME time ago we received some specimens and seeds of an alleged wild coffee from Nyassaland. Mr. R. L. Goodlock, to whom we sent the specimens for identification, passed them on to the Kew authorities. A recent letter from W. I. Thistleton-Dyer pronounces them not to be coffee at all, the botanical name being *Cremaspora africana*, Henth, Syn. *C. coffeoides*, Hemsl.

The following account of the plant appeared in the *Kew Bulletin* for July and August 1896:—

WILD COFFEE IN BRITISH CENTRAL AFRICA.

Sir Henry Johnston, K.C.B., Her Majesty's Commissioner in British Central Africa, published in the *British Central Africa Gazette* for October 15th last the following account of a presumed wild coffee in Nyassaland. The plant, however, on examination at Kew, proved to belong to a different tribe of Rubraceæ to *Coffea*. It appeared to be a plant hitherto unknown and was described by Mr. Hemsley in the *Kew Bulletin* for January last (p. 18) as *Cremaspora Coffeoides*. The genus comprises but a few species, all confined to Africa and adjoining islands.

The Commissioner's account is subjoined:—

On his recent journey to Mlanje district, Her Majesty's Commissioner made an interesting discovery. In the valley of the little Nyungivi stream, which flows direct into the Ruu about 10 miles east of the confluence of Likubula and the Ruu, and close to the place where the Nyungivi is crossed by the main road to Fort Anderson, the Commissioner found growing species of wild coffee apparently identical with that which is met with in the interior of Mocambique, on the Zambesi, and at Inhambane. By a happy chance this wild coffee was not only in blossom, but bore the ripe berries at the same time. In growth the tree was very straggling, and somewhat resembled the original cultivated coffee tree in the Blantyre Mission grounds. This wild coffee was found growing for several hundred yards along the banks of the stream. The Commissioner collected a large number of berries, some of which were ripe, and these will be planted in the gardens at Zomba. Specimens were also collected of the leaves, flowers and fruit for transmission to Kew for identification.

It has generally been stated by the Commissioner himself amongst others that there is no wild coffee indigenous to Nyassaland, and certainly up to the present discovery it was believed that no specimens of the wild coffee had been found by any one. The Commissioner searched diligently in almost all the other stream valleys that he crossed in the Mlanje district for other specimens of the wild coffee, but was not able to find any.

It is just possible that these trees found on the Nyungivi stream close to the Portuguese border might have had their origin in seeds of the wild Zambesi coffee accidentally conveyed there. At the same time, seeing that coffee is indigenous to tropical Africa, and is found in almost all the warm parts of the continent which are not absolute deserts, it is very extraordinary that a fertile region like Nyassaland should almost alone possess no form of indigenous coffee. The Commissioner, therefore, desires us to publish this discovery for the information of planters and others who, by careful investigation, may succeed in discovering a wild indigenous coffee in the British Protectorate. Meantime he has no objections to the berries of the wild coffee growing on the Nyungivi stream (which is on Crownland) being gathered by any persons who may like to try the experiment of planting this wild coffee.

THE MARKET OUTLOOK.

THE *Triester Zeitung* is much distressed at what it states to be the utterly hopeless position in the coffee market. Our contemporary puts the blame for this upon the Brazilian coffee growers, whom it accuses not only of under-estimating their crops, but of continuing to place their coffee on the market in ever-increasing quantities, to the utter ruin of any chances of profit by their competitors. The recent reports of the extent of the Brazilian coffee crop have, according to this newspaper, completely knocked the bottom out of any hopes that the coffee trade was not in such a bad position as was represented to be the case.

In the opinion of the *Triester Zeitung* there is only one thing which will remedy this state of affairs, and that is the formation of a strong syndicate to buy the whole of the present visible coffee supply of Brazil, and all that remains in the interior, and lock it up until better times come round. Our contemporary thinks that this operation would be by no means difficult at the present moment, and that a capital of £6,000,000 would probably be all that would be required to carry it out. Inasmuch as the *Triester Zeitung* thinks that large profits might be made by this scheme, it sees no reason why capitalists should not go into it.

The *Hamburger Handelsblatt* rather ridicules this proposal, and asks—as if that were a conclusive argument—why, if there is no money in the coffee trade, a proposal requiring £6,000,000 for its realisation, should be made at all? The Hamburg newspaper, referring to an allusion by its contemporary to doctors and patients in the coffee market, rather unkindly suggests that schemes of this kind have about them more of the quack doctor than the legitimate practitioner.

The product which possesses the greatest commercial value in East and Central Africa is coffee which is grown in the Shire Highlands, within an area of over 3,000 square miles. In the last two or three years the export of coffee and the extent of the land planted have increased materially.

It is now current gossip in the Shire Highlands that Mr. Cecil Rhodes intends investing in some of the coffee estates. This is considered a very likely possibility in Blantyre, for Mr. Rhodes is well known to entertain a high opinion of the chances of profitably cultivating coffee in the territory. He has urged the necessity however, of bringing expert knowledge to bear, and if he acquires any of the plantations it will be with the intention of putting a Brazilian expert in charge of them. A Blantyre correspondent expresses the opinion that "definite experiments on a sufficiently large scale are really needed to place the coffee industry on a sound basis."

It is stated that an expert is now in Mexico on behalf of Scotch and London capitalists and bankers, who contemplate, if his reports confirm their private advices, investing a good deal of money there in the purchase of lands suitable for coffee.

This gentleman is understood to have stated that a small lot of Oaxacan coffee was recently shown in London, and was examined by the buyers of Mincing Lane, who all pronounced it far superior to the first grade Brazilian coffee, and it was at once sold at a high price, some 15s. more per quintal than the Brazilian article. When in New York he was told by large buyers that they would agree to make contracts covering a term of years for coffee of the best grade from Mexico. He is convinced by what he has seen of Mexican

high-grade coffee that there is a future before the trade. He added that in both London and Scotland there is now much interest taken in Mexico, and that a great many young Englishmen and Scots would probably come over in the next two years to learn practically the coffee and tobacco growing business.

THE HOME MARKET.

The Coffee Trade.

The following particulars gleaned from an interview between the representative of the *Grocers' Review* and Mr. Thomas Dutton, the Manchester representative of Messrs. Hanson, Sons, and Barter, may be worth attention:—Being interrogated, Mr. Dutton commented upon the history and production of coffee, and observed that he thought the first coffee that became popular in this country was that produced in Ceylon. Mocha coffee, he said, had been in the market many years, but at present it was not used very extensively, although he considered it would be better for the trade if such was the case. "How do you account," asked the interviewer, "for the gradually decreasing consumption of coffee?" "It is the same all the world over; everybody nowadays is desirous to embark on enterprises which are likely to give the best financial results, and the foundation for this decreasing consumption in coffee is due, in my estimation, to the planters, who are paying more attention to the cultivation of tea, and the lack of facilities to place the article upon the various markets at a considerably less price than is the case at present. I cannot blame the planters abroad for giving their attention to tea production, as, without a doubt, it is far more remunerative than the producing of coffee, because tea growing practically goes on all the year round, whereas in coffee there is only one crop. I should say, at all events, that the planters produce two or three pounds of tea to one pound of coffee, the consequence being that the former can be sold cheaper. Indeed, so much more remunerative is tea growing as compared with coffee that they are attempting to produce it in East Indian districts—in fact, operations have already been commenced in the neighbourhood of Neilgherry. It is now quite apparent that the coffees coming into this country from the East Indian and Mysore quarters are of gradually decreasing quantities, probably owing to the reasons I have stated. However, to the majority of the trade, this fact of the scarcity of these growths of coffee matters little, because the Costa Rica coffees are largely taking their place, the latter being now used as a 'self' coffee—one which does not require blending. The Costa Rica growths are, without a doubt, displacing those of Jamaica, Mysore, East Indian, and Plantation. The price at which an article can be sold of course has a great deal to do with its sale, and decreasing consumption for, say, some ten years, is attributable, I think, to the high—I may almost say exorbitant—prices retailers have to charge. In fact, the prices of coffee do not give much encouragement to the retail trade. You can buy tea cheaper than coffee. If the retailers could sell coffee from 1s. 4d. to 1s. 8d. for the finest, I have no hesitation in saying that a stimulus would be given to the trade, inasmuch as a demand would be created. The finest coffee at present is being sold at 2s. 2d. and 2s. 4d. a pound, whereas a class of tea may be obtained for one-third of the money. Coffee is certainly not a cheap beverage at such a price. To give further force to my argument that coffee has decreased in consumption owing to the high prices which have had to be charged, I may say that between 1884 and 1897, when consumption was very high, Costa Rica growth could have been bought at such a figure as to allow it to be retailed at about 1s. 4d. or 1s. 6d. per lb. The result of retailers being able to do this, they marched with the times and greatly increased their sales—in some cases as much as trebling their trade."

The Future of Coffee.

Asked as to the future of coffee, Mr. Dutton said: "As far as the future

is concerned, there are certainly signs of considerably heavy crops. The stocks in London and on the Continent are accumulating, with the result that during the last six weeks or two months a reduction has taken place in the quotations to the extent of 10s. to 15s. from the highest point. Reverting to the facilities for getting the coffee on the market, I may say according to various authorities they are exceptionally bad. In many places in Africa as many as 700 or 800 miles have to be traversed in order to get the coffee to the rendezvous for despatch. Indeed, I have read—and I can quite believe the statements—that it has been known that African producers have carried on their backs quantities of coffee distances of 300 and 400 miles with the sole object of getting it to the navigable rivers. In my opinion, if Africa was 'opened up' thoroughly, it would clearly demonstrate that it was a most luxuriant growing country."

The Distributing Centres.

Asked what he considered the greatest distributing centres for coffee, Mr. Dutton replied: "Undoubtedly the North of England. Very large quantities are distributed in Lancashire, Yorkshire, Durham, and Northumberland." "How do the Manchester and Liverpool markets compare with those of other cities?" "We in Manchester and Liverpool," continued Mr. Dutton, "are guided by the London market, which is, I consider, the most important one in the world inasmuch as it is the 'levelling' port. It guides not only the various cities of the United Kingdom, but the largest of the American markets. "Then, when our markets are affected, those in America are affected likewise?" "Yes, that is so; the American markets are practically governed by the stocks of the United Kingdom. "A large quantity of coffee must be imported into London. "I should think," said Mr. Dutton, "that the bulk of the coffee produced finds its way to London. There are, of course, shipments to Liverpool, but not, as yet, to Manchester. I believe there has been one though." "Do you think grocers might make more use of coffee than they do at the present time?" "Now, that is a most vital question," explained Mr. Dutton, "and one which, without hesitation, I can confidently answer in the affirmative." "Are the methods of distribution adopted by the generality of grocers bad?" "You have hit the nail on the head," said Mr. Dutton. "Generally speaking, the present mode of distribution is not a very good one."

How to Improve the Retail Trade.

"The most important feature to bring about a successful coffee trade is to pay great attention to the roasting of the article. Every grocer should roast his own coffee. I know of many gentlemen," said Mr. Dutton, "who have made a 'big' hit with roasting their own coffee, and which has proved very successful, both from a financial point of view and from the point of view of giving extreme satisfaction to their customers. I know one particular individual, and he is known to almost every grocer throughout the country either by name or person, who, some twenty years ago, only roasted about two or three bags of coffee per season, but to-day, evidently through giving strict attention to roasting and buying, his trade has developed to such an extent that he thinks little now of purchasing tons for a season. This, as you know, is a large order, and I think I am quite safe in saying that his trade has been mainly built up by giving attention to roasting frequently. A great many traders work on the old-fashioned lines, often having coffee in stock a week, or four or five days, or even twenty days before they want to begin to use it. Now from a business point of view, this is a bad policy, because I believe it is the experience of the trade that when coffee is stocked so long roasted it loses its value something like 40 per cent.; hence the necessity for roasting frequently." "Of course, very little expense will be incurred in roasting?" "Comparatively little. A public company roasts 1 cwt. of coffee for 1s."

28lb roaster can be obtained for £4 or £5, so there is not a great expense attached to it." "I believe it has been suggested in certain quarters that the coffee used on the Continent is inferior, as a rule, to that used in England?" "Yes; there is no doubt that the people on the Continent consume inferior growths of coffee as compared with those in England, but when you say that you must take into consideration that Continental people are going out to better advantage the constituents and qualities of the article. For instance, if you get a cup of coffee, say, in Paris, in any other large city, the coffee, as a rule, is roasted, ground, and brewed while you wait. This bears out the argument I mentioned previously that if coffee was dealt with properly and a better result would be achieved. The coffees that are sent to other countries would not take in this country at all." "And on the Continent you can get a good cup of coffee from an inferior article as compared with us in England with a superior article?" "Well, no, that is not exactly what I mean," explained Mr. Dutton. "What I really contend is that we in England, by using that coffee is dearer than tea, use the article more sparingly than do the people on the Continent, the consequence being that we do not get as good a beverage—not that with the same quantity of article we cannot compete with foreigners. As I have said before, the people on the Continent indulge in the best facilities for making a good cup of coffee, and we in England, generally speaking, do not; hence the necessity of purchasing a superior growth of coffee." "English people are too economical in this respect, then?" "Yes, that is what I believe; they use the article too sparingly." "What kind of coffee is in demand on the Continent and America?" "Mainly Santos, African, and Rio growths." "How do you account for the great demand for coffee and chicory?" "Well," said Mr. Dutton, "I firmly believe that pure coffee at the present day is not a poor man's beverage on account of the price, and as a consequence the public prefer to take a mixture of coffee and chicory at a less price. Of course the latter substance is nutritious; in fact I could prefer good chicory to a great deal of Santos, African or Rio coffee."

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,

SOMETIME AGRICULTURAL CHEMIST IN CROOG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)

(Reprinted from *Madras Mail*.)

III.

THE VALUE OF COFFEE MANURES.

I.

EVERY planter and agriculturist accepts the dictum that manures are valuable aids to the cultivation of crops. Sometimes their value is questioned, but this generally happens when the manure used has proved unsuitable to the land, or to the crop, or they may not have been enough applied, or there may have been too much. Coffee supplies will stand 4 cwts. per acre of ammonia sulphate under favourable conditions of weather, but 8 cwts. is too much, it kills them off. Under like conditions 5 tons of cattle manure (first quality) answered well, but 10 tons was almost as bad as 8 cwts. of ammonia sulphate. This shows that even cattle manure must be used with discretion. It is deservedly a favourite; it is like a charge of snipe shot, it covers a wide area and has less chance of missing the mark than such a manure as hindy or oilcake, in which the ammonia preponderates so greatly over the other manurial elements, and sometimes, like a bullet, misses its billet. Theoretically a very poor soil has sufficient materials for a great number of crops, practically it has not; hence the value of manures. There is a general law of the greatest practical

importance to all agriculturists and planters, viz.:—"If a soil be deficient in any one element, no manure is of value on that land which does not supply the deficiency." For instance, in England practice has shown phosphoric acid to be the element required by turnips, and as a rule phosphatic manures produce good results; but if the soil is short of nitrogen or potash, manures supplying only phosphates will be of little or no value. Again, if the soil be short of iron or sulphuric acid, wonderful results may be obtained by the application of iron sulphate in moderate doses; but if there happens to be a large quantity of ferrons salts already in the land the results are nil; or worse, the crop may be killed off. Gypsum in sulphate of lime is often very useful where lime and sulphuric acid are required, as it supplies them cheaply, especially when a superphosphate is used as only the soluble phosphates are paid for. Every agriculturist is familiar with the fact that repeated applications of lime exhaust the land unless they are well backed up by manure. This results from the circumstance that lime renders the nitrogenous matter of the soil more easily assimilable by the plant, the ammonia acts as a powerful stimulant, and the increased energy of the plant enables it to absorb such food as the roots come in contact with it more rapidly. The soil is exhausted when any one of the elements of fertility is reduced in quantity below that necessary to supply the immediate requirements of the plant in an easily assimilable form; there may be plenty of the element in the soil, but so shut up by its combination with silica, etc., that it is not immediately available as plant food. The value of comparative soil analyses which enables us to judge what is necessary to supply the deficiency of the soil, is of primary importance, as we are by them able to render the necessary assistance to the soil, that is, supply a manure that will remedy the defect. To quote Sibson and Dr. Voelcker:—"The infertility of a soil is often explained by an analysis. The soil may be suffering from the want of some material indispensable to the growth of plants, or it may contain something poisonous to plants. In either case chemistry is generally able to enlighten us, and to point out means of remedying the evil. Of a soil whose fertility is impaired we can all pronounce that it wants manuring; but with the assistance of an analysis we may also learn in what substance the soil is deficient, or what kind of manure it wants. With this knowledge we may restore its fertility in the most economical manner." As pointed out in my paper on coffee manures, soil analyses settle many vexed questions of cultivation; they decide the question as to whether the land requires drainage, and whether shade should be thick or thin; but their greatest value to the planter lies in the fact that they enable him to get full manurial value for his money. Having settled what the soil requires, we must next enquire what the plant demands. Unfortunately there is no royal road to this end. Experiments on soils of known composition with different manures, under widely different conditions of climates, soil, etc., are needed to finally settle the question. The cereals and root crops of Britain have been and are the subjects of constant study and experiment. Law and Gilbert's work has done much to solve many abstruse questions, and to place the cultivation in England on a scientific basis, enabling her to compete with the prairie land of America and Australia and the cheap labour of India in the growth of wheat and other crops. Such experiments are much needed in connection with tropical produce; it was the want of such experiments in regard to coffee, tea, cocoa, etc., that led me in my paper on coffee manures to say that "the question of manuring coffee has had little systematic work spent on it compared with the vast interests at stake." Had I said "little systematic experimental work" most people would have agreed with me. I was fully aware of the valuable work done by Messrs. Marshall Ward, Morris, Thwaites, Trimen and others in connection with *Hemileia vastatrix*; the thorough systematic

investigation of that pest is deserving of the highest praise. I consider that the thanks of the whole coffee planting community are due to the beforenamed gentlemen, the Ceylon Planters, Government and the *Ceylon Observer* newspaper for the energy and zeal displayed in their crusade against the pest. The information gained is of inestimable value in guiding future investigations. Hughes' analyses I know and fully appreciate the value of, but I would like to see systematic experiments put in hand to determine what is, to use Ville's words, the "dominant element" required in a manure for coffee, tea, cocoa, and other tropical products. Having found the dominant element we must first supply the deficiency. If any exists, and the probability that it does is great—in the soil, then apply it.

From the view of a plant few soils are complete; a complete soil should grow any and every plant equally well, provided the climate is equally suitable. Any soil can be made complete; it is only a question of £. s. d. With suitable manures you can grow plants in calcined sand. Coffee Arabica can be made to yield a ton per acre; on a small block, say up to 5 acres or so, it pays to spend Rs. 200 to Rs. 300 per acre per annum and pick crops of 10 cwts. to a ton. But when we come to 200 to 1,000 acres or more the labour difficulties are so great that such cultivation is a practical impossibility. An average of 5 cwts. per acre must for coffee under shade, with ordinary work and manure, be considered good except on very poor land—and patches of such exist on every estate. Such crops can be caught in South Coorg; the average crop of one block of estates there has averaged 4 cwts. per acre per annum for the last 10 years, and there are other blocks as good, and individual estates with much higher averages are to be seen throughout the District. There is every prospect of the average being raised, as the labour difficulties are overcome and the general work can be kept well in hand, allowing of steady systematic annual broadcast manuring being carried out at the right time. There is little doubt that it is best to manure every portion of the estate yearly, but under some circumstances, if the labour is sufficient, two manurings would be better for the trees. Last year (1890) South Coorg was no better off for labour than her neighbours; the evil effects were pointed out and the District bestired itself and procured coolies to replace the Canarese. Tamil labour was introduced; coolies were not paid off at the usual time, but retained as long as possible; all the supply pits required for perceptible vacancies were cut in the hot weather; the weeds were kept down, and I had the pleasure of seeing supplying briskly proceeding early in June.

Leaf disease (in Coorg) in hot weather receives a severe check, and I do not think that where the land is well and deeply cultivated and efficiently manured there is much to fear. On well drained lands it will kill off the trees, but there is no denying that it does often seriously affect crops—a tree cannot well exert its energies to produce leaves when bearing crop without dropping some of it. Efficient manures adapted to the necessity of the plant and the deficiencies of the soil are of the greatest assistance. Too much stress as regards manures for coffee has been laid on the composition of the bean, and too little attention devoted to the leaves and prunings. Take Marshall Ward's estimate of twenty-one weeks as the duration of the life of a coffee leaf, the tree must shed all its leaves $2\frac{1}{2}$ times in a year; under shade they remain a little longer, but the trees as a rule certainly renew their leaves at least twice a year.

This loss on a healthy tree is not noticed, as it proceeds all the year round. It is a poor tree of seven years' growth that has not fifteen hundred leaves on it at least at some period of the year; a fair average tree will have over two thousand and a first class one in full leaf as many as three thousand or more. Then there are the prunings. Let practical planters experiment as Mr.

Cameron, of the Botanical Gardens, Bangalore, suggested to me the other day, surrounding a few trees with wire netting, collecting the leaves and prunings weekly or monthly, dry and weighing them, and have them analysed. With other produce the same course could be pursued. In this way it would be seen what demand the plant makes on the soil for available food at different periods of the year. Having decided that a manure is required and what it is to be, the question is how to supply the estate with it at the least cost in the most suitable form. All manures vary greatly in quality.

A merchant guarantees the bones or other manure supplied pure, but the quality of pure bones and other manures of undoubted purity are of very different manurial value. The following analysis show how widely pure bones vary in quality:—

	Macadan.		Sibson.	
	Highest.	Lowest.	Highest.	Lowest.
Phosphates	57.08%	44.72%	48.14%	44.95%
Ammonia	5.23%	3.34%	...	...
Alkaline Salts	85%	32%	1.91%	.63%
	Hughes.		Pringle.	
	Highest.	Lowest.	Highest.	Lowest.
Phosphate	54.03%	39.40%	52.25%	43.77%
Ammonia	4.48%	3.01%	5.09%	3.25%
Alkaline Salts	...	...	2.02%	.50%

Sibson unfortunately does not give the ammonia, and Hughes unfortunately does not give the carbonic acid with alkaline salts which prevents comparison; but on page 107 of his "Ceylon Coffee Soils and Manures" the composition of Indian bone dust is assumed to be

Nitrogen	...	3.5 p. ct. equal to ammonia	4.25
Phosphoric acid	...	2.4 " " phosphates	52.32

Here then in pure bones, or what is sold as such, we have phosphates, i.e., tricalcic phosphates varying from 39.40 per cent. up to 57.08 per cent. and the ammonia from 3.01 per cent. up to 5.23 per cent. The alkaline salts found in bones are generally assumed to be magnesia and soda, but in some samples a notable quantity of potash is found. Whether it is derived from the food of the animal or from accidental mixture with wood ash I am not able to say.

The Agricultural Societies of Great Britain generally fix selling price units for the season and manures are valued on them. For Southern India and Ceylon the units might be fixed by the Planting Associations and the Chamber of Commerce. For the present I will take bones and oilcake as the standards for phosphates and nitrogen. It is necessary in the first place to decide what constitutes a fair marketable quality of bones and hindy in oilcake. In England the manure manufacturers generally buy bones on basis of 48 per cent. phosphates (i.e., tricalcic phosphates) and 4 per cent. ammonia. Numerous analyses show this to be a fair average. In valuing bones the alkaline salts are not considered only the phosphates and ammonia being paid for. Assuming the price per ton for bone flour of that quality to be Rs. 60 at Bangalore, Colombo, or the West Coast, we may estimate the value of other manures in comparison with it. Castor hindy may safely be assumed to contain 6 per cent. of ammonia and cost say Rs. 36 per ton; the ash though very valuable as plant food is not valued as it generally corresponds to the percentage of ammonia. We thus get the value of six tons units of ammonia in oilcake as Rs. 36, or Rs. 6 per unit per ton; that in raw bone flour is worth as much per unit. Deducting the value of four units of ammonia, Rs. 24, from the total price of the flour, we get Rs. 36 as the value of 48 units of phosphates, or three-fourths of a Rupee per unit per ton for phosphates. The home price is about one shilling and nine pence for phosphates and eleven to twelve shillings for ammonia. So that these manures here are cheaper than in England.

As showing the valuable nature of castor cake and of its ash the following analyses may be of interest:—

		Castor Cake
		parts per 100.
Moisture	...	6.71
Oil	...	10.03
* Albuminous Compounds	...	30.29
Mucilage, Gum, &c.	...	19.64
Woody Fibre	...	27.34
Soluble Ash	...	5.16
Insoluble Matter, Sand, &c.	...	.83
		100.00
* Containing Nitrogen	...	5.05
Equal to Ammonia	...	6.13
SOLUBLE ASH ANALYSIS.		
Lime	...	.09
Magnesia	...	.67
Potash	...	1.98
Soda	...	.76
Phosphoric Acid	...	1.21
Sulphuric	...	.24
Chlorine Acid	...	.21

5.16

Analyses of the ash of oilcakes are seldom made, but the proportion of phosphoric acid worked out to phosphates is equal to 2.64 per cent., worth very nearly Rs. 2 per ton, and there is potash 1.98, worth about another Rs. 2. But the Rs. 6 paid for each unit of ammonia covers that.

The following are the generally accepted proportionate values of phosphates and ammonia:—

90% pass through screen.	Phosphates.	Ammonia.
Bones $\frac{1}{8}$ inch mesh	20	132
„ Meals $\frac{1}{16}$ „ „	21	138
„ Flour $\frac{1}{32}$ „ „	22	144
Fish, whole (about the size of sprats)	21	144
„ Meal $\frac{1}{16}$ „ „	22	150
Oilcake $\frac{1}{16}$ „ „	—	144

In England the price of ammonia chiefly depends on the supply of ammonia sulphate: in India most probably on oilcake.

A determination of the nitrogen in it, expressed as ammonia, is all that is required to determine its value, as the consumer knows that, from a manurial point of view, if the cake is rich in nitrogen the percentage to him of valuable ash will be high, and the valueless oil low, and *vice versa*. Carriage is a most important item to most planters, and an oilcake which has over 6 per cent. of ammonia is more valuable proportionately to them on this account than one with less, though both are paid for at the same rate per unit. The buying of oilcake by analyses is the fairest plan both for planters and manufacturers. For instance, suppose two coast firms offer oilcake, one at Rs. 36 with 6 per cent. ammonia and one at Rs. 42 per ton with 7 per cent. delivered on the coast. The up-country planter has, we will say, Rs. 10 per ton to pay for carriage; therefore the prices of the cakes on his estate are respectively Rs. 46 for 6 per cent., or Rs. 7 and 66 cents, or Rs. 7-10-8, while the 7 per cent. cost Rs. 52 per ton, or Rs. 7 and 43 cents., or Rs. 7-6-10. Let us suppose the order to be for 100 tons 6 per cent. or the equivalent in 7 per cent., then the bill stands as follows:—

100 tons 6 per cent. at Rs. 36	...	Rs. 3,600
100 „ carriage at Rs. 10	...	„ 1,000
Cost on the Estate	...	Rs. 4,600

Ammonia supplied 6 tons cost per ton ... Rs. 766

Only 85 tons 14 cwts. 1 qr. of the 7 per cent. are required to supply 6 tons ammonia, therefore the cost is roughly:—

84 tons 14 cwts. 1 qr. at Rs. 42	...	Rs. 3,600
Carriage on the above at Rs. 10	...	„ 857

Rs. 4,457

6 tons ammonia supplied cost per ton ... „ 743

The actual saving by purchasing the equivalent of 7 per cent. instead of 100 tons of 6 per cent. is Rs. 143, a saving not to be despised in these hard times. The most careful and conscientious maker of oilcakes can only guarantee that they shall contain a certain percentage of ammonia; if he supplies more it is only right that he should be paid for it, or he can divide his cakes into classes to suit his customers. On the other hand the consumer has an equal right to ask for the cake he likes best and is prepared to pay for. In some cases where carriage is difficult it would pay the planter to give a Rupee or even two per unit or more for a high class oilcake with 9 or 10 ten per cent. ammonia. White castor cake of this quality can be produced, though Macadan gives the average for castor cake in Great Britain as $5\frac{1}{2}$ per cent. Hughes gives 9.45 per cent. as the highest for white castor, but the sample had 11.57 per cent. of oil in it, which could with advantage to the planter be reduced to 5 per cent. or less.

TEA.

A New Book.

A short time ago we had the pleasure of publishing at length an interesting lecture on tea, delivered in London by Mr. Crole. His promised book has just been published, and we hope to have the pleasure of reviewing it at no distant date. The book is published by Messrs Crosby, Lockwood & Co., London.

Rebulking in London.

For some months past complaints have been growing in number as to the unsatisfactory manner in which the bulking of tea is performed. Garden bulking is yearly growing more unsatisfactory, while London bulking is decidedly a costly operation, and forms an extra charge few planters can afford to bear with equanimity. With the improved appliances and machinery now gradually being adopted in the best bonded warehouses, we fancy the charges will come down considerably, for we have no belief that garden bulking will, or can, ever be conducted in the scrupulously careful manner which such an important operation demands.

The Home Market.

INDIAN TEAS.—With an improved demand and light supplies the market has shown a firmer tendency, says the *Produce World* of the 17th ultimo. The medium grades have been well inquired for, and occasional advances have been established; speaking generally, these teas are more difficult to obtain at former prices, and as the quantity remaining in first hands, especially the Leaf descriptions, is somewhat restricted, present rates will no doubt be sustained. The values of the common sorts remain steady, but the few lots with a good infusion and black Leaf brought improved prices, while the fine and finest descriptions, which are getting into a small compass, are actively competed for at hardening rates. Owing to the many complaints of the irregular out-turn of Indian Tea imported this season, the subject of bulking has been brought more prominently forward than hitherto. As the imports are largely increasing it is necessary that the facilities for properly bulking should be ample, and it is doubtful if this matter has received the consideration it deserves by the importers. The space allotted at the warehouses may or may not be sufficient at the moment to meet the requirements for this purpose, but with a further material addition to the imports it is clear that increased accommodation will be necessary if the

bulking is to be efficiently done, and it rests in a great measure with the owners of the Tea to devise methods that will adequately meet the case. We have repeatedly pointed out that the seat of manufacture, wherever practicable, is the place where the bulking should be done, and there appears no insuperable difficulty in this respect, as several of the larger companies formerly adopted this course with success. It is evident that Teas so packed retain their flavour much better than when turned out here and exposed to variable atmospheric changes—in some cases for several days. To avoid this it will, of course, necessitate the assimilation of the weight of the packages for the purpose of taking an average tare, as is the case with China Tea. The comparative smoothness with which the Indian Tea trade has been conducted in the past is, no doubt, due to the absence of reforms, but the time has arrived, with the largely increased production, when radical changes are required to place the business on a proper footing.

THE UTTER COLLAPSE OF THE CHINA TRADE.

To Indian and Ceylon tea-planters the following letter from the Shanghai correspondent of the *Morning Post* will be good reading. He says:—

The British tea trade with China is rapidly shrinking up. The present season (1896-97), so far from holding out any hope of improvement, exhibits more rapid retrogression than ever. With one solitary exception, every port of shipment exhibits a decrease. The exports to Great Britain from the commencement of the season to the middle of January fell from 43,362,000lb. to 37,336,000lb. The northern, central, and southern districts have all the same tale to repeat of reduced demand. The Hankow and Shanghai shipments, which take the lead in quantity, lost nearly three million pounds as compared with the corresponding period of 1895-96, their aggregate to date having been only 18,410,000lb. against 21,317,000lb. The central districts shipping by Foochow are nearly two million pounds short—12,749,000lb. against 14,676,000lb. The southern districts shipping from Canton and Macao are over one million pounds short—an aggregate to date of 6,177,000lb. against 1,368,000lb. on the corresponding period of last season. So far as concerns our own market these figures only bear out what was already matter of general knowledge. They cause no surprise as some of the other figures do. China was supposed to be finding compensation in America for her losses in Europe, but that turns out to be a fond delusion. This season's shipments to the United States and Canada have fallen off to almost as large an extent as those to Great Britain. They aggregated up to the middle of January 49,755,000lb. or fully three million pounds less than the corresponding aggregate of last year, which was 53,128,000lb. China's final resort is Russia, but here again we encounter a sharp shrinkage—at least in the shipments to Odessa. Their total for the season has so far been only 22,049,000lb.—fully four million pounds less than last year's total of 27,240,000lb. More tea may have gone overland to Siberia, but that is hardly likely in view of the growing diversion of Russian trade from the overland to the sea route.

A CHAMPION OF TEA-DRINKING.

"EITOL," in the following letter reprinted from the *Pall Mall Gazette*, has some interesting remarks on the effects of tea-drinking. His knowledge of the present system of tea manufacture are crude and some decades behind the time, but his citations of authorities in favour of tea are decidedly to the point.

"I think the public have been quite unnecessarily alarmed by certain hysterical individuals with regard to the terrible dangers which lurk in the teapot. As a physician, and especially as a medical officer of health, I have given the subject of tea-drinking a good deal of my attention, and it may be of interest to your readers to give them what I hold to be the best expert opinion on the subject.

"In order to understand anything about the effects of tea on the human economy, it is necessary to know a little about the leaf itself. I think I can compress this into very few words, and will simply premise that it should be clearly understood that the various teas sold under the trade names of Orange Pekoe, Pekoe, Souchong, Congou, &c., are all picked at the same time from the same shrub. The uppermost leaves and buds constitute Pekoe, those a little lower down Souchong, and the bottom leaves constitute the cheapest variety, Congou. The leaves on being picked are allowed to lie in heaps for about twelve hours, when they are dried over charcoal fires. The best tea consists of small unbroken leaves; the cheaper the tea the larger the leaf and the more dust it contains. On analysis tea is found to consist of five things:—

	Parts per 100
Water.....	8
Theine, an alkaloid or active principle.....	2½
Tannin.....	14
Aromatic essential oil.....	½
Vegetable colouring matter and organic salts.....	75

The theine is the constituent of tea which gives it its medicinal value in headache and fatigue. It is a powerful nervous and cardiac stimulant, and to it is attributable the bad effects which excessive tea-drinking produces on the nervous system. The essential oil gives tea its refreshing smell, and acts as a stimulant. The vegetable colouring matters simply colour the infusion, and are of no import, but the tannin is the alleged author of most of the so-called terrors of the teapot. It is only present in any considerable quantity in tea which has been a long time drawing; so if it is an evil, it is one which is attributable rather to the tea maker than the tea itself.

With regard to the effect of the tannin of tea on digestion, Sir William Roberts, M.D., F.R.S., speaks as follows in a lecture recently delivered at Owens College, Manchester:—"A good deal has been said of the injurious effects on gastric digestion of the tannin contained in tea. I question whether the statements made with reference to this matter are worthy of attention. It has been alleged that meat fibre is hardened by tea, and that the coats of the stomach are likely to be injured by this beverage. These views are entirely theoretical. Leather is no doubt a very tough, indigestible substance, but meat is not gelatine, and the coats of the living stomach are not dead membrane. Meat fibre does not, as a matter of fact, harden in tea; on the contrary, it swells nearly as freely in acidulated tea as in simple acidulated water. And the same is true of solution of pure tannin. Its effect on digestion in the stomach is comparatively slight."

"Sir William Roberts goes on to prove by elaborate experiments that tea acts as a distinct retarder of digestion, but declares that in so doing it performs a useful, nay, an essential, duty in our dietary. 'A slow digestion,' he is at pains to point out, 'is quite a different thing from an imperfect digestion; indeed, it has seemed to me that dyspeptics sometimes suffer, not from a too slow, but from a too hurried, digestion.'

"As the result of his experiments, he holds that:—"In the plan of the dietary of the civilised races, arrived at slowly as the result of immense experience, we seem therefore to detect two apparently contradictory aims—namely, on the one hand, to render food by preparation and cooking as digestible as possible, and, on the other hand, to control the rate of digestion by the use of certain accessory articles with food, such as tea. In reality these objects are not contradictory, but co-operative to a beneficial end. For, to express the matter in another way, it may be said that we render food by preparation as capable as possible of being completely exhausted of its nutrient properties; and, on the other hand, to prevent its nutrient matter from being wastefully hurried through the body, we make use of such agents as tea, which abate the speed of digestion."

"This combination of appliances renders our plan of feeding more elastic, more adaptable to variety of individual health and constitution, and to variety of external condition. According to this view the stomach becomes under this influence of tea a storage organ for food—like the crop of birds, the paunch of ruminants, and the dilatible cheek of monkeys, and the use of the herb, instead of being pernicious, is almost an essential to the adult dietary.—Your truly,
EITOL."

DIGESTED TEA NOTES.

III:

MANURING.

My last paper was all about soils. I shall now present Mr. Bamber's ideas, as well as those of others, on how to improve the soil by manuring.

To begin with China and Japan. The Chinese use everything they can get, from conjee-water to the dung of silk-worms. In Japan fish manure is very largely used. It were more or less waste of time to dwell on the methods employed in these two countries, as it is very certain they are, like their system of manufacture, very much behind the times.

Green-manuring in tea does not seem hopeful. Mustard can be sown easily enough, but must be left two to three months undisturbed in pruning time. What result this would have on the tea is difficult to foresee. The Black Mustard is the best, 16 lb. per acre suffices. Sulphate of lime, 5 to 10 cwt. and powdered saltpetre, 2 cwt. per acre would be beneficial if applied as a top-dressing when the mustard was 2 inches high.

Another method, not touched on by Mr. Bamber, is that of growing belts of leguminous trees or shrubs as wind-breaks, and applying their loppings to the neighbouring plants. This method seems to assure greater success than annual sowings of mustard, etc., especially if the plant chosen could be used as fuel for the factory. A sort of universal cure would it become: a manure plant, a fuel tree, and a wind-break! The actual value of the loppings from leguminous trees is too well-known to my readers to need any explanation.

There is a very general impression in Upper India (excepting Kangra and Darjeeling) that it will never pay to manure tea. From two reasons. First, that rich soils don't want any; secondly, that poor soils will only exhaust themselves if any appreciable quantity of manure is applied. Latter is rather too absurd to argue over.

It may be taken as an axiom that if cattle manure is intelligently used, an application every two to three years is ample. But if artificials or chemicals are used, a yearly dose is a matter of practical necessity. Further, that inasmuch as all but the poorest of tea-soils contain an abundance of minerals, nitrogen is practically the only element worth troubling about. And, generally speaking, a good class fish-manure is the cheapest form to apply it, especially if one remembers that fish contains certain valuable minerals never found in poonacs. Chemicals are generally more expensive than poonacs, *i.e.*, with regard to the unit of nitrogen.

Before touching on the experiments detailed in Mr. Bamber's book, it will be as well to mention the results now obtained in Ceylon. A very favourite dose is four ounces of poonac and bone mixture (4 to 1 mixture) per tree. The increase of yield is between 50 to 100 %. Manuring is as yet confined to old coffee-land tea and young tea opened on poor land. The financial results are excellent.

The Assam experiments were made with much larger doses of manure, as much as over one ton per acre of poonac being applied at a time.

Cotton seed was tried in Chittagong some years ago @ 2 and 3 lb. per bush. Former gave an increase of 23 % and latter 50 % in yield over that obtained from the unmanured plot. To destroy the vitality of the seed it was heaped in 50 or 100 maund stacks, moistened with cold or hot water and covered over with clods of earth. It took from 5 to 8 days to accomplish this object.

Superphosphate applied at the rate of 720 lb. per acre on Seleng garden yielded an increase of 25 % in yield, and compared

most favourably especially in light soil with those plots treated with nitrogenous manure. Superphosphate on heavy soil showed no appreciable change.

The whole series of experiments points the same moral: chemical manures, be they mineral or nitrogenous, act far better in light than on heavy soils.

All manuring should be preferably given to heavily pruned bushes, as it is at that period that the plants most require assistance to overcome the effects of the severe treatment. It will also be found that the plants will form sound straight wood from near the ground, which will afford material to prune upon for several years to come, and none of the effects of the manure will be wasted.

Curiously enough, Mr. Bamber, after having given minute details of certain trials in experimental manuring, then turns his attention to the theoretical branch of the subject and discourses learnedly thereon. A few brief remarks should not be unacceptable.

It is well, before attempting manuring experiments, to know the chief needs of the plant in question. Tea is extremely rich in nitrogen, containing in its dry state 5 % to 6 % or much the same as poonac. So that if any decided increase of yield is wanted, a nitrogenous manure is of the first importance, though in light soils soluble minerals (especially phosphates) have been already shown to be extremely valuable.

The chief nitrogenous manures are: oil cakes, guanos, salts of ammonia, nitric acid, cattle manure, and some rich peaty soils. Good rich peaty bheel (swamp) soils are the best of all tea manures, the effects being fairly quick and of very long duration. The expense, however, is considerable per application, though not so in point of fact.

The most important minerals removed by the tea leaf and prunings are as follows:

Phosphoric Acid	...23.35 per cent. of the ash.
Potash	...24.61 "
Lime	...15.05 "

Tea made from Hybrid leaf contains 6.62 % of ash, while that from China leaf is 6.35 %. The chief minerals are present in this ash to the extent of:

	Hybrid.	China.
Phosphoric acid	...20.79	20.31
Potash	...38.00	38.64
Lime	...8.51	7.31

Roughly speaking every maund (80 lb.) of tea takes away as much potash as is contained in 9 pounds of sulphate of potash, and as much phosphoric acid as is present in 4½ lb. of bones.

It is just as well to get familiar with the average composition of artificial and other manures, always bearing in mind that a very slight difference in the analysis may make a very great difference in the manure bill of an average estate.

	Nitrogen.	Phosphoric Acid.
Margose Cake	... 5.25	1 ———
Castor Cake	... 6.66	1 ———
Ground Nut	... 5.75	1 ———
Fish Manure	... 7.00	8.50
Bat Guano	... 10.00	6.00
Cotton Seed Cake Decorticated...	7.50	considerable.

Fish manure usually contains a large percentage of sand, but this is wholly due to careless manufacture. The utmost it should contain is 5 %, and an allowance should be made on any that exceeds this amount.

Bheel Soil.

Cost of application varies from 35f. to 90f. per acre, according to distance, average depth of dressing 6 inches. The value varies very greatly and an analysis should be invariably obtained before using it.

	Rich Cachar Bheel Soil.	Ordinary Assam Bheel.
Calculated on the dry soil ...	%	%
* Organic matter and combined water ...	34.29	14.74
Phosphoric acid ...	.50	.07
Potash ...	.56	.81
Lime ...	.07	trace.
* Containing Nitrogen equal to Ammonia...	1.19	.694

Either soil compares very favourably with ordinary cattle manure, but it must always be remembered that the effects, while being vastly more permanent, are not so immediate. Two or three points should be borne in mind in swamp-soiling:

Let it dry thoroughly before application, as the water otherwise increases the expense of transport enormously.

Always swamp-soil in the dry weather, as the poisonous acids get dissipated before they have time to be carried down to the roots.

Lastly always apply as a surface dressing, and never put in pits or trenches

A six inch dressing is equivalent to about 340 tons of *wet* soil, or 120 tons of *dry* soil per acre.

The actual quantities of manurial constituents supplied by a 6 inch dressing are enormous, equalling that contained in 6 tons of sulphate of ammonia, $1\frac{1}{2}$ tons of sulphate of potash and $2\frac{1}{2}$ tons of bone: say a total money value of R. 1500. As the application comes to under R. 100 per acre, the manurial wealth contained in a neighbouring swamp of good quality may be guessed at. A cubic foot of dry soil weighs about 12 lbs. Twelve tons of good swamp soil are equal in manurial value to one ton of ordinary poonac.

Cattle Manure.

Ten to twenty tons per acre every two years is probably the smallest amount worth applying, or say $\frac{1}{5}$ th to $\frac{1}{2}$ bushel per tree. The analysis of cattle manure differs so greatly that it must suffice to say that a very fair sample of plantation manure does not run higher than $\frac{1}{2}$ per cent. of nitrogen. It is a very great mistake to think that abundance of litter lessens the value of the manure. The percentage of constituents remains very much the same, while the actual quantity is much increased. It is always best to apply cattle manure as *fresh as possible*, especially on soils poor in humus. It is best hoed in. Sulphate of lime or Kainit freely scattered over the manure does much to preserve the otherwise inevitable loss of nitrogen consequent on storage.

Bones.

Properly steamed bone undergoes decomposition very rapidly, usually in the first year. On fine sandy soils it is more advisable to apply coarser grades to prolong their action. A grade varying from dust to particles $\frac{1}{2}$ inch in diameter is generally most suitable: the dust being taken up at once while the large particles decompose more slowly. Good bone meal usually contains about 50 per cent. of phosphate of lime and 4 per cent. of ammonia if "raw" and $1\frac{1}{2}$ per cent. if steamed.

The cheapest way of obtaining bone manure is to buy the whole bones, and either convert them into bone black, or stack them in heaps until decomposed. If the heaps are moistened occasionally with cattle urine, and covered up with a layer of soil, the process will be usually complete within a few weeks. They will then become much softer and may be easily broken up before application. From 3 to 10 cwts. per acre may be tried with success, larger applications showing no profit. Bone black contains about 69.75 per cent. of phosphate of lime, and may be obtained cheaply from sugar factories, or obtained from the raw bone by burning. The action is decidedly slow. Decomposition may be greatly hastened if applied in conjunction with fermenting vegetable manures.

The process of converting bone-dust into superphosphate is simple. Procure a wooden trough or box coated with pitch to prevent the sulphuric acid destroying the wood. Of which acid, 32% and of brown 41%, of the weight of the bone dust

is required. Place a layer of fine bone dust in the trough. Fill up with coarser fragments of 1 inch in diameter nearly to top. Pour in the acid so as to thoroughly moisten all the bones. Stir occasionally, and let it remain for some hours. The gases given off are poisonous. Then remove the mixture, and add if necessary some fine bone dust to dry up any excess of acid. In one or two months, powder it up and apply to the bushes at the rate of 5 to 7 cwts. per acre. The effect is generally rapid, and the bushes improve in appearance and yield.

The great danger in using superphosphates is that unless the soluble phosphoric acid is at once taken up, it will be reconverted into insoluble basic phosphates.

Basic slag is another phosphatic manure, and one that should be invariably purchased on analysis. Much depends on the fitness of the particles, of which at least 80 to 90 per cent. should pass through a sieve of 10,000 meshes per square inch. A portion of the phosphates is in a readily available form, and more soluble than that in ordinary bones.

Of guanos there are two principal kinds, nitrogenous and phosphatic guanos. They should be invariably purchased on analysis.

Wood ashes again vary greatly in quality. They should never be allowed to be exposed to the action of rain, as the soluble minerals are thereby almost entirely washed out. Ashes increase the outturn if applied in large quantities of 5 to 7 cwts per acre, especially if combined with nitrogenous manure. A fair sample may contain 16% Phosph. acid, 25% Potash and 10% Lime.

Sulphate of potash contains only potash (e.g. as regards manurial value) and is of no particular use to see wood ash is generally far more valuable.

Saltpetre or nitrate of potash is essentially different to the sulphate. It contains a very high percentage of nitrogen and is markedly stimulative when applied at the rate of 2 cwt per acre.

Nitrate of soda should also, for the same reason, be valuable as a tea manure.

Sulphate of ammonia is of much the same class.

Sulphate of iron has also been tried in small doses, but with no appreciable results. Great care should be exercised in its use.

Sulphate of lime is valuable chiefly on account of its solven effects on the insoluble plant food in the soil. It must be borne in mind that the best effects of lime are only shown when applied to soils rich in vegetable matter. When applied to soils poor in humus, the visible effect is very small, notwithstanding the fact that the soils may contain only a trace of lime. Applied as quicklime its effects on stiff clay soil are very marked. Lime does not seem to be a necessary ingredient of tea-soil, as, in its absence, magnesia is largely able to take its place. The chief value of lime lies in its mechanical action. Applied to heavy soils, it should be in the form of quicklime and must be hoed in at once, so that its expansive powers in the process of slaking should take place entirely in the soil. On light soils it is best given with composts of decayed jungle or other refuse material, the decay of which it greatly promotes. This compost, enriched with the wood ash from the factory and lines, would produce a manure little inferior to that from the ordinary grass-fed cattle.

(To be continued)

DISTRICT ASSOCIATIONS.

SHEVAROYS.

PROCEEDINGS of the monthly committee meeting, held by the kindness of Honorary Secretary, Y. T. C., in the Tennis Pavilion, Yercaud, on Monday, April 19th, 1897, at 10 A.M., when there were

present: Messrs. J. C. Large, C. Rahm, Junr., E. H. King-Harman, G. Lechler (*Chairman*), H. W. Leeming (*Honorary Secretary*), Gompertz, and Mr. W. J. Lechler, by invitation.

1. Notice calling the Meeting was taken as read.

2. Read letter, dated 26-3-97, from Mr. W. J. Lechler *re* the instruction of a short length of Road between Ajampatti and Allipatti Villages to connect the Estates on the North of the Shevaroy with Mallapuram Railway Station.

Resolved "that, pending the decision of the Salem District Board, this matter lie over for future consideration."

3. Read letter, dated 11-3-97 (postponed from last Meeting), from Mr. Large requesting that a reward from the Association "Police Reward Fund" should be granted to Head Constable No. 492.

Resolved "that a sum of Rs. 5 be awarded, through the District Superintendent of Police, to Head Constable, No. 492, Jalal Khan, for a conviction in connection with a coffee theft case on Cascades estate."

4. Read and recorded, for future reference, G. O. No. 656, L. Mis., dated 3-4-97, *re* the "Shevaroy Road Fund."

5. Read and recorded correspondence *re* Case No. 343 of 1896, in the Court of the 2nd Class Magistrate at Yercaud.

6. The following Papers were laid on the table:—i. "Planting Opinion" for April 3rd and April 17th, 1897. ii. "Agricultural Ledger," Nos. 3, 35, 39, 40 & 41 of 1896. iii. "Commercial Circular," Nos. 1 & 2 of 1897. iv. Proceedings of the Annual General Meeting of the South Mysore Planters' Association.

Proceedings of a General Meeting of the Wynad Planters' Association.

" of the Quarterly General Meeting of the Coorg Planters' Association.

" of the Annual General Meeting of the North Mysore Planters' Association.

With a vote of thanks to the Chair, the Meeting terminated.

C. G. LECHLER, *Chairman*.

H. W. LEEMING, *Honorary Secretary*.

CENTRAL TRAVANCORE.

A GENERAL MEETING of this Association was held in the Church Bungalow on Saturday, the 24th ultimo, when there were present: Messrs. F. M. Parker (*Chairman*); L. W. Baker, H. J. Blandford, R. H. Goldie, L. W. Crawhall, H. S. Holder, R. S. Imray, C. Lance, G. MacGowan, L. M. Knight, the Rev. Father P. Segretain, D. Tolle-mache, the Hon'ble V. B. Wilbraham, C. H. Williams, and G. L. Acworth (*Hon. Sec.*) Also as visitors: Messrs. A. Nicholson (the British Resident), H. G. Arnold, and J. B. Nicholson.

The Chairman, in opening the proceedings, said:—

GENTLEMEN,

As I was unable to be present at the last general meeting, owing to certain sad circumstances to which I need not further allude, I must take this opportunity of thanking you for the honour you have done me in electing me your Chairman. As to my qualifications for the office, it is for you, not for me, to judge. I only know of one, and I am not sure that that is one to be proud of.

I am one of the few members now left among us who assisted at the birth of the Association, who nursed it through its early troubles, and who have seen it develop into strong and healthy manhood. Gentlemen, it is with great pleasure that we welcome here to-day the presence of the British Resident. We are deeply grateful to him for taking so kindly an interest in our proceedings, and if occasion arose, we fully realize the benefit we should derive from the counsel and guidance of the British Resident. It is of great advantage to us that during his visits to these hills the Resident becomes personally acquainted with us as planters, and from his knowledge of us and our district, can see for himself, whether any little grievances we may happen to have are legitimate or not. We do not demand large consti-

tutional reforms like the gentlemen in the Transvaal. We only ask for comparatively small favours, such, for instance, that a first-class magistrate may be always with us, and that our roads may be kept in decent order.

The minutes of the last meeting having been taken as read, the Honorary Secretary gave the following précis of the more important correspondence that had taken place since the last meeting:—

Land Sales.—The Dewan had promised that in all future notices of land sales in the Gazette, the actual reserve price should be published, and it would not therefore be necessary for applicants to proceed to Trivandrum to bid, unless they thought the price sufficiently moderate.

Local Fund, Madura.—The President of the Board had informed the Honorary Secretary that nothing could be done to the bridge spanning the outflow of water from the Periyar lake on the Goodaloor ghaut road until the sluices were shut. The moment it was possible to close the sluices, the work would be taken in hand.

Government Buildings.—The Dewan had requested the Chief Engineer to select a site more suitable to the altered condition of the district and to submit estimates for the removal of the buildings thereto.

Title-deeds for Land bought in October 1895.—The Honorary Secretary, having brought to the notice of the Dewan the great inconvenience caused to the purchasers by the delay in issuing these deeds, had been promised that they should have immediate attention.

It was, however, much to be regretted that the survey officer having been removed from the district, considerable further delay was likely to occur.

Application for Free Grant of Periyar Land.—At the request of several members, the Honorary Secretary had, through the first-class magistrate, protested against any free grant of this land for experimental cultivation, as it was now becoming scarce and valuable.

Tea Thefts.—A long correspondence on this subject had passed between the Honorary Secretary and Messrs. Aspinwall and Co., and owing to the precautions taken by those gentlemen on the one side, and members of the Association on the other, these thefts had for the present stopped.

The meeting then proceeded to the business on the agenda paper.

Indian American Tea Fund.—It was unanimously agreed that the Association would again support the fund, and that a tax on all estates should be levied at the rate of four annas per acre and half an anna per maund of tea made.

U. P. A. Address to the Queen-Empress.—Read and approved.

Telegraph Subsidy.—The Honorary Secretary was requested to write to the Director-General of Telegraphs and ask him to be good enough to allow half-yearly statements of the accounts of the local office to be furnished to the Association, as members were unable to understand how, with the increasing business of the office, so large a sum had to be paid by them to cover the guarantee.

Roadway Widths.—The correspondence between the Dewan and the Chief Engineer and the Honorary Secretary was read, and the agreement come to between the Chief Engineer and the Honorary Secretary, the latter being instructed by the Committee, was endorsed by the meeting.

Withdrawal of First-class Magistrate from District.—Proposed by Mr. Parker, seconded by Mr. Imray, that in the event of the first-class magistrate being transferred elsewhere, H.H. the Maharajah's Government be respectfully requested to appoint another resident first-class magistrate as speedily as possible.

Labour Contracts.—In drawing attention to this subject, Mr. Veale said:—

MR. CHAIRMAN AND GENTLEMEN,

It is now close on three years ago that this Association passed a resolution with a view to the registration of canganis and maistries employed in the district, but as it was impossible to find a competent native to act as registrar, the scheme was allowed to drop. Whether the scheme, if carried out, would have proved as effective as was at the time expected, I think there is some doubt, more especially in

respect to canganis, but with respect to maistries of skilled labour, such as sawyers, carpenters and the like, some such scheme is as necessary now as it was then, if not more so, to protect ourselves from the indiscriminate manner in which these men take advances from several estates. Only recently a case of this sort has happened to me. A sawyer who had been working for about four months for me wished to go down to the plains; I settled his account and, on his agreeing to return to the estate in 15 days, I gave him another advance in Cottayam. He returned to the estate in the allotted time, but only remained three or four days.

After several weeks I heard that he was working on Glen Mary. I first of all wrote to Mr. Laurie asking him to send the man back, and next day I went over to see Mr. Laurie, hoping that we might arrive at some mutual arrangement whereby we should each get some work out of the sawyer and a fair chance of recovering our respective advances. But I regret to say Mr. Laurie did not see the force of my arguments and declined to meet me. Nothing, therefore, was left me but to prosecute for breach of contract, which I did; the man was convicted and ordered to fulfil his contract within 30 days. The magistrate at the same time gave him a letter to Mr. Laurie, informing him that the man had been convicted and requesting him to allow the man to leave Glen Mary, but, needless to say, the sawyer has never been near the estate since, and I have every reason to believe the man is working still at Glen Mary.

I now find that I can only get that man punished for contempt of court. My advance is quite irrecoverable, which is certainly hard lines, but the defective nature of the laws of the country are responsible for that. I think we are all agreed that this indiscriminate taking of advances by sawyers, carpenters, and the like is not conducive to our best interests, and if we are unable to obtain any aid from Government, such as the framing of new laws, we must, if we wish to put a stop to it, combine together to help ourselves, but we must be entirely unanimous if we wish to do any good.

Do not suppose for a minute that I am blaming Mr. Laurie in any way, for I am sure he was quite in ignorance that the sawyer was under advance to me, but if the position had been reversed, I cannot help thinking Mr. Laurie might have taken a different view. But I would suggest one of two things—either that we again make an attempt to start the registration, not of canganis, but maistries of skilled labour only, and that we try it for a year to see how it will work. If no competent native can be found to undertake the work of registrar, let one of us try; if no other gentleman will make the attempt, I will, at any rate for a time, or let a sub-committee be appointed to frame rules, by which we shall all agree to abide, to meet such cases as the one I have quoted. For instance, let one rule be something of this kind: if a maistry take an advance from one estate while still in debt to another, that the manager of the estate who gives the second advance shall immediately compel the maistry to return to the estate which originally advanced him, unless the manager of that estate prefers that he should take over the amount of the debt.

The Association sympathised with Mr. Veale in this particular instance, but it was generally felt that the unwritten law was so well known, and was as a rule so cordially carried out, that legislation on the lines suggested by Mr. Veale was unnecessary.

Medical Fund.—The Honorary Secretary informed the meeting that the Committee, having gone into figures, found to its regret that it would be necessary to levy a tax of Rs. 2 per acre to support the establishment. It was hoped that, when the returns of out-patients at the various dispensaries were sent in, the Government would assist the Association with a grant for each hospital and dispensary. In the meantime it was hoped that members would be willing to pay the tax for the first six months. After some protestation this was agreed to, but it was felt the work could not be continued for any length of time without Government aid, and the heads of the various dispensaries

were urged to keep an accurate record of their daily patients.

A very cordial vote of thanks to Mr. Veale for the time and trouble he had spent in working out the scheme was passed.

Before the meeting closed, the British Resident said that he must thank the members for having invited him to attend, and that he was very pleased at having been able to do so, for it was a very great advantage to meet the planters and to hear from their own lips what their needs and necessities were. They performed a public benefit in opening up the country and turning waste lands into productive gardens, but in doing this work little differences were sure to occur between themselves and the authorities. It was an advantage to him to hear personally what the differences were, and so far as lay in his power, he would do his best to smooth them over. As regards the first-class magistrate, he might mention that he had some conversation with the Dewan on the subject, and had been assured that an officer would be appointed as speedily as possible.

With respect to roads, he certainly thought they were not what they might be, but the Chief Engineer would be up in a few days, and when once here, he had no doubt the Association would know how to deal with him.

He believed that thefts of 'planters' produce occurred everywhere, even more in the coffee than in the tea districts. In the former they had the marvellous fact, that oftentimes the proprietor of a half-acre garden would export two or three tons, a happy result that no European proprietor has yet been able to attain. He understood that the thefts on the roads occurred chiefly near Pambadie, and it would be well to talk to Mr. Bensley and see whether a pettah for carts could not be established there.

It only remained for him to congratulate the Association on the wonderful public spirit they displayed in dealing with the medical aid—a spirit very different to what he had seen in some other districts. He would conclude by once more thanking the meeting for inviting him to attend.

The meeting then adjourned.

SHORT STORY.

A TALE OF FAIR KASHMIR.

It so happened that some five years ago I found myself in Murree in April with my friend, and hearing the people at the hotel talk of going on into Kashmir, we felt we might as well go too; accordingly after we had got tents, ponies, stores ready, we started and marched in, taking seven or eight days to reach there.

The tonga road was not built then, and we had to follow the old bridle-path, sometimes so high up that we could only just hear a murmur of the river below, sometimes so low down that we had to shout to make ourselves heard above the roar of the stream.

The first four marches are not very interesting, but after we had passed Gharri, the scenery became wilder and wilder, the snow lay thicker on the upper hills, and it was generally colder, and the leaves were only just beginning to come. On the eighth day of our march we reached Barramoola at

HYDROCELE & ASTHMA. Instant relief! Permanent cure guaranteed or the Price (Rs. 5) refunded. Do not despair, even if in the last stages. Apply to—MANAGER, V. C. WORKS, Ranaghat, Bengal.

rance of the valley, and there the Jhelum, which had all along a rushing, roaring, snow-fed torrent, widened out into a broad, slow, flowing muddy river. As we neared the little town, we were met by a crowd of dirty and eager boatmen and shikaris, each armed with a sheaf of chits, who clamoured for employment. A Kashmiri's most treasured possession in life is a bundle of chits, and when he dies, they say, they are buried with him, to enable him to obtain good employment in a future life.

We engaged a boat each for ourselves and a smaller one for our servants; our boats were pointed both ends, some 60 feet long and 8 feet wide, with mat walls and peaked mat roof. We occupied the front part of the boats, and the boatmen, with their wives and families, the back parts.

The cook boat was of a similar shape, but smaller; on it we put our tents and servants. These boats are called doongas; we also had a small boat called a shikara, that seated two or three passengers and five paddles; they are of the same shape but have no walls and only a light top, and are about 18 feet long.

I had also engaged a shikari, who had been highly recommended to me; I sent him on ahead to a place called Rampore, about 7 miles above Kunos, on the Woolar Lake, where I hoped to find bear.

We started that evening and tied up for the night at a little village called Kamsapura, about two miles upstream, by which we avoided the noise and dirt of Barramoola.

Next morning we were up at 7 A.M. to find a bright sun and blue sky, and got a most glorious view of Nanga Parba (17,000) showing to the north of the Nag Merg Hills. Then we went to breakfast and suddenly found we had started. They had cast the boat off and got out a tow rope whilst we were sitting down, and now we were shipping upstream so quietly that we should not have known we were moving but for the ripple of the water at the bows of the boat and the constantly changing scenery.

That afternoon we reached Sopur, and watched a sahib fishing under the bridge for a bit; he said "he had fished all day and caught nothing" like the men in the Bible, but the words were hardly out of his mouth when his rod was nearly pulled out of his hands and the line was tearing off his reel; farther and farther went the fish, till he had hardly any line left, then he managed to recover some of it, when off it went again; I shouted to him to untie his boat and follow the fish, which he did and soon got on to better terms with it, and finally landed it opposite the Hindoo temple after a 30 minutes' fight—a good fish (mahseer) of 23 lbs.

It was getting late in the evening, but we went on upstream at the deepening twilight towards hoary old Hari Monk (17,500) with his snows all aflame in the rays of the setting sun long after the valley was in shadow. We tied up for the night at Ningel, where the Jhelum leaves the Woolar Lake, and heard from a man who was camped there that there were a good many ducks in, and that the slow straight stretch of river in front of us was a great place for mahseer and chirroo fishing in July and August. He told us also that the mosquitoes at Ningel are a pest and so big that one day a new chum went out with a gun and shot three or four and when he came back asked if they were not vampires. Seeing we doubted his veracity, he owned that the story sounded unlikely, but he would tell us what happened to himself, which was quite true and which he would vouch for. I felt sorry for him, as I felt sure after this preface he was going to prepare himself pretty badly. He said, "I was fishing for mahseer, which run up to 10 lbs. here, and the mosquitoes were awful; they were so bad that one day when I was having a bath they lifted up the flap of my tent; I saw them coming and bolted under the flap, rubber bath-tub, which I turned upside down over me;

but they had seen me and tried to get at me through it. I let them get their trunks well into the rubber and then clapped my hands, hoping that they would fly up and break off their trunks in the bath, but not a bit of it; there was a whirr of wings and they actually carried off my india-rubber tub. I use a tin one now." We said good night hurriedly, lest he should tell us another lie and strain himself, and went to bed to dream of mahseer and mosquitoes.

As a matter of fact in fishing at Ningel in July, August and September you have to wear gloves and tie your coat sleeves, tuck your trousers into your boots and wear a bag of mosquito-netting that goes over the hat and under the coat collar; if you do not take these simple precautions, you lose about $\frac{1}{2}$ lb. of blood a day.

Next morning when we woke up we were out in the middle of the Woolar Lake. I was having a plain soda to get the taste of the mosquitoes out of my mouth when I heard a girl's voice in evident distress. I went to the front of the boat to see where the sound came from and saw a small boat with one man, an old woman and a girl sitting in it and two mangies (boatmen) paddling. The man was leering at the girl and the old woman was counting over some money and laughing, whilst the girl was sobbing bitterly; however, when she saw me she pulled off her veil and called to me to save her in broken Hindustani. I jumped into my small shikar boat with my gun in my hand, and with three boatmen to paddle me soon caught them up. She was a Punditani who had been stolen from her home by the man, who was a Mussulman Zemindar. As soon as she saw me coming she had covered her face again, but I suppose she saw that her good looks had impressed me enough to enlist me on her side, and she was good looking.

The Zemindar blustered a bit, but I threatened to send him to Srinagar in care of the police on the charge of abducting a Hindoo woman, and he climbed down and tried to be off, so I told the girl to get into my boat and the man to clear, which he did promptly, the best frightened man in Kashmir, for it would have been bad enough if a Hindoo man had run off with a Mussulman girl, but here a man of the lower class had run away with a girl of the ruling caste.

When I got back, my pal laughed at me and called me Don Quixote and other sorts of a fool, and asked me if I meant to marry my captive, but I told them "No," I intended to take her back to her parents. "But do you know who her people are, or where they live?" I said "No, but I can easily find out. We will have a week at the bears first and then I shall run up to Srinagar and hand her over to her people. In the meantime I'll have to get a Hindoo woman of her own caste to look after her and cook for her, for she evidently is accustomed to be waited on." He laughed at me, and asked her what she thought of the idea. But she only laughed back and said the Burrah Sahib was good and kind and would no doubt do what was right. We got to the edge of the lake at Kunos that evening and met my shikari with good khubber of bear, and the ponies which had marched across from Barramoola, but he decided not to start till the morning as it was seven miles uphill and a bad road, so we had the tents put up, and I gave up mine to my protégé who was named Chota Begum, and I luckily found an old Hindoo woman of her own caste in the village whom I paid to attend to her, for she was a dainty little lady, with eyes like a gazelle's and cheeks like the almond blossom and lips like cherries. When only my friend and I and her old attendant were present she would uncover her face, but muffled herself up if any one else appeared. She told me that her father was a wealthy pundit in Srinagar, and that he had some business connection with the man who had stolen her. This man was a Mahomedan Zemindar called Karim Malik, and on one of his

visits to Srinagar had seen Chota Begum accidentally unveiled for a moment and became enamoured of her and had sworn to carry her off. He had bribed her attendants, and as she was coming back from the temple one evening she had been sopped by him, gagged and bound and carried off down the river and had no chance to call for help till she saw our boats, and that was all she could tell us.

Next morning we broke camp and marched up to Rampore, and I noticed that my friend X. was very attentive to Begum, walking beside her pony, and paying her clumsy compliments in bad Hindoostani. However, I thought nothing of it till that evening; when the tents were pitched and we were settling down for the night I heard a scream, and running towards the sound, I found my companion trying to steal a kiss from my friend; she wrenched herself free, and ran over to me saying she did not mean anybody else to kiss her but me. I told her not to be frightened, and my friend that he was a brute. High words ensued, and he went off to his tent in a rage. I was sorry yet relieved, as the little woman had possessed herself of my hunting knife, and said she'd stab him if he came back, for she had a temper of her own.

Next morning my friend apologised, and we beat for bear. Chota Begum insisted on coming with me, although I tried to persuade her to stay in camp, but she would not stop away, and it was a good thing for me that she did come, as you shall see.

We tossed for places and I won the toss; so we took up our positions at the top of a shallow nullah with a good many wild apple and pear and walnut trees in it, X. and his gun-bearer on my left, Chota Begum, my gun-bearer, and I on the other side. The nullah was a long one, and looking down we could see the lake and river and plain lying below and blinking in the sunshine. At first, the sound of the beating was faint enough, but it got louder as the beaters approached. First the pigeons began rocketing overhead, flying fast and making no sound. Then a covey of chikor slipped past like grey shadows, all going hard and silently. An old red fox gallops up to within 20 yards and waits listening with his head on one side and his flanks heaving and then trots on his way in blissful ignorance of our whereabouts. It is getting intensely exciting as we try and make out what the beaters are saying. In the dead silence that comes with a pause of the shouting we hear a couple of red monkeys chattering, and that mostly means large game afoot. The sound of the beaters is loud enough now, and I can make out the call of Balu! Balu! and then a blood-curdling yell follows, enough to wake every bear for miles round. Suddenly down below and rather to my right I hear the bushes crackling and Chota Begum touches my arm and silently points in the same direction. I can see the tops of the hazel bushes waving; then the scrub parts and with a ugh! ugh!! out roll two bears below me and to my right. I have a small trench about 4 feet deep and 5 wide cut by the rain which is between us and runs downhill, and from my right to my left, all the rest is short grass and scrub for 50 yards. One is a real big one, the other is smaller. Bang! Bang!! twice clean at 40 yards, and it turns back and disappears in the scrub; scrub won't do! I then let drive at the smaller one; he pitches over into some bushes, and as he does not come out again, I hope he is dead. I found him afterwards shot through the heart; he had dropped dead in his tracks. Then I hear four shots from X. on my left and then silence again but for the yelling of the beaters. Suddenly Chota Begum catches my arm and calls "Sahib, look out; here's the big bear back again;" so it was and meaning business too. The gun-bearer and I had been looking downhill and to the left, and the big bear that I had missed at first had come on again, this time very savage. She had got up on my right hand and was rather above us, and charging for all he or

rather she was worth; but for the little trench I should hardly have had time, but I gave it the first shot as it was on the opposite edge and it pitched forward into the hollow badly hit and then I gave but two more shots before she had time to scramble out, and there she lay dead at my feet almost. Then I saw another but could not get a shot at it and it crossed to X., who missed it. Then another came past me which I hit but which went on and I failed to bag. The place seemed alive with bears, but that was the last and the coolies were only 3 yards off now. So I held up a stick with a handkerchief at the end to stop the beat and called up the coolies and have our spoils carried up to where the tiffin basket was waiting under an old apple tree. I had got two bears, one big one and one about three years old. X. had killed one about the size of my smaller one and missed another. There had been six or seven bears in the beat, for another big one was there which did not come up to us but broke back through the beaters, slightly clawing one of them. After tiffin we left three or four men to skin the bears and take the heads and skins back to camp. We had two more beats, but only saw one more bear, and did not get that and got back to camp very fairly satisfied. About 4-30 P.M. we got back to camp. We had seen no red bears, only black ones but the coats were very good. Next day we did not do much. X. went and got some partridge, and Chota Begum picked some mushrooms. Whilst I stuck to the camp I saw the skin pegged out and scraped, wrote letters and shot a few pigeons so you see we fared sumptuously. X. had by this decided to go and try for ibex whilst I was content to stick to bear till I was a better climber, and also Chota Begum would now be able to stand the rough work of marching to Ibex and Markhor ground. X. went off next morning, but I stopped on another week, and got another bear and then announced my intention of going up to Srinagar and handing "my lady" over to her father.

This plan was met with violent opposition. The Begum was dead against it. She upbraided me. She wept, she said that she had always been unhappy at home since her mother had died and her father had married again. Then when she found that I would not listen to her reproaches, she changed her tactics and putting her arm round my neck she tried coaxing this would not do either I felt; so I put on my sternest air and told her not to be foolish; she got rather frightened at this and wept again, but when she saw an unlucky smile that I could not quite repress she began coaxing. That evening we were on board, and by eight next morning we had crossed the lake and were in the river; we went on upstream and reached a place called Sumbal that night. The Gilgit-Srinagar road crosses the river here by a wooden bridge, and there is a capital camping ground where I put up a tent for Begum. Next day we went on and stopped for breakfast at Shadipore and reached Srinagar about 5-30 P.M. I sent up to the city to Begum's father, and when he came told him the whole story. He was a handsome old man with a sweeping white beard. He was furious with Karim Malki, but unfeignedly glad to get his daughter back, and thanked me very much for bringing her to him again. Then I dismissed him and turned to say good-by to the Begum; but she was gone, though she had been sitting close to us a few moments before. We hunted high and low but could not find her, and finally the old man went off saying she had probably ran home. But I had a message the first thing in the morning to say she was still missing, in fact had never turned up at all at her home. I did not stay in Srinagar, but went back to the bears two days later, but that was not the last I saw of the Chota Begum; though as Kipling says "that is another story."

"KALA BALU."

THAT MASTERFUL YANKEE.

THE writing of Mark Twain are full of instruction as well as merriment. Possibly you have read that wonderful story of his called "A Yankee at King Arthur's Court." The hero is a skilled mechanic, the foreman of a great factory in America. He is accidentally killed, we would say; but, instead of getting his body deposited in the grave, as happens to the most of us, he comes to life again, and finds himself at the Court of King Arthur in England in the sixth century, 1000 years before he was born. That was a time of deep ignorance and superstition; people were but children then. So with his knowledge and his nineteenth century training he soon becomes master of everybody and everything. He controls the Government and rules the whole country—exactly as a college professor would be superior to all the children if he should take it into his head to join the class at a parish school. Now let us see what this idea may mean to you or to me.

In the autumn of 1873 Mr. James Murphy, of 49, Townsend Street, Dublin (present address 5, Synnott Row, Synnott Place, Lower Ormer Street) had a severe attack of rheumatic fever and was under treatment at the Sir Patrick Dunn's Hospital for three months. When he left the hospital, but not the man he was before the disease laid upon him. Afterwards he was never free from it. For a while he would be comparatively well, then down on his back again. It would depend on the weather and other circumstances, you see.

Of his worst times he speaks in this way: "My ankles and feet were hot and painful, and would often swell to three or four times their natural size. Occasionally the pain extended to the hips, and had to be swathed in wadding from the thighs down to the ankles. In this way—now able to get about and now confined to my bed—I suffered for over seventeen years. The joints of my fingers and toes came displaced, or seemed to be so."

We don't need to point out what a cripple this sort of thing makes a man. If he were wounded and torn in battle or by machinery couldn't be worse off. Yet the number of people thus disabled is immense, and while rheumatism is peculiarly the disease of adults and old persons, the young (even children) do not escape it. If the disease were only understood—but let us not get ahead of our story. "At Christmas, 1890," continues Mr. Murphy, "I had a dreadful attack, and was confined to bed for seventeen weeks."

This took him clear through the rest of the winter and one month spring up to the first of May. What a dreary, miserable season must have been! There is no merry Christmas or jolly coming of the buds on the trees for a man in that situation. Still, it might have been prevented if he had known then what he found out later.

"All this time," he goes on, "I was in the greatest agony. I couldn't move myself in bed, and finally got so bad I couldn't lift my hand to my mouth, and had to be fed like a baby. Night after night got no sleep, and often wished myself dead. As for work, I thought I should never do a stroke again. The doctor who attended me gave me medicines, but I seemed none the better for them. I had long since lost all faith in rubbing oils and embrocations; I had spent pounds for them without benefit."

"One day, whilst still suffering great pain, I came upon a book telling how cases like mine had been cured by Mother Seigel's Curative Syrup. Not knowing what else to do I bought a bottle of Dr. Mannin, the chemist in Brunswick Street. After taking this medicine a day or two I had less pain, and I was able to leave my bed, and fourteen days later I had not an ache or a pain of any kind, and got back to my work. Since that time—now two and a half years ago—I have had no return of my old complaint. I never felt better in my life than I do now, and I thank God that I ever heard of Mother Seigel's Syrup. You are at liberty to publish my statement. I have been in the employment of Mr. Robinson, coal merchant, for the past ten years. Yours truly, (Signed) James Murphy, Dublin, June 23rd, 1893."

The mysterious American at King Arthur's Court was powerful because of his knowing what nobody else knew. Had Mr. Murphy known years before that rheumatism is caused by impurity of the blood, and that Mother Seigel's Curative Syrup cures it, he could have defied and banished that agonising ailment. We print these facts in order that his present knowledge may also be everybody's knowledge.

KALLAI WORKS, CALICUT.

ARBUTHNOT & CO.'S SPECIAL MANURE FACTORY.

MANURE SEASON 1896-97.

Fish Guano.—A Speciality. Specially prepared and manufactured from Fresh Fish in new patent machinery and under a new process.

Bone Meal.—Finest Powder. Medium or Coarse—Castor, Ground Nut, Hoongay, Neem and other Poonacs—flour milled.

Trichy Phosphates.—90 % guaranteed to pass through sieve, 1,000 meshes to square inch.

Sun-dried Fish.—Either whole or milled, guaranteed free of sand

Superphosphates.—Nitrate of Soda, Sulphated Salt, Muriate and Nitrate of Potash, Basic Slag and other imported manures. Quotations will be obtained as early as possible.

MANURES MIXED IN ANY PROPORTION FREE OF CHARGE.

Coir Matting of every description, from the finest quality Twill to common Estate Shade Matting. Prices from Rs. 15 to Rs. 1-8 per roll of 60 ft. by 3 ft.

Quotations and further particulars will be furnished by our Tellicherry and Mangalore Agents for delivery at their ports, and by the undersigned.

D. N. MORISON,
MANAGER, KALLAI WORKS

PLANTING OPINION.

A FORTNIGHTLY JOURNAL

(WITH MARKET SUPPLEMENT)

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. II.]

COONOR, SATURDAY, MAY 29, 1897.

[No. 11.]

MANAGER'S NOTICE.

Back Numbers: A few odd *Back Numbers* offered. A few odd back numbers of 1896 for sale at four annas each.

Covers for Vol. I. Cloth covers for binding Volume I of *Planting Opinion* have been prepared, with a set of Index sheets for dividing the Nos. 1 to 34 for easy reference. The cover and set of Index sheets may be obtained from Messrs. Addison & Co., Madras, printers of this journal, for Rs. 3, but it is recommended that subscribers should send their copies to that firm to have them bound, as it makes a bulky volume and strong binding is necessary. The charge for binding, complete, is Rs. 3-8.

SEASON REPORTS.

NOTICE.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 11th June 1897.

Nellampathy. 25th May.—*Weather.*—A lot of rain has fallen, but just how much at the present moment I can't say. Hope to be able to next report. Mornings and evenings are very cloudy and monsoonish, and it seems as if the monsoon was coming in up to time this year. *Crops.*—Prospects are bad and the coming year will, I fear, be little better than the one just gone, as it is only the first blossom that seems to be doing anything. The second in almost all cases was an entire failure. *Plant-diseases.*—Very little, and coffee looking very well indeed. New clearings are simply wonderful. *General Health.*—A lot of sickness among Europeans and will be till the rain comes to wash it out. The Moplabs who were working on through the hot weather had at last to go as they were getting fever and dysentery badly. *Labour.*—Tamils not in yet. A few Malayalees available, but what work there is, is being done by Mulsers and Cadars.

Kadur.

MUDGIRI, 24th May.—*Weather.*—Half an inch of rain fell on the 19th and clouds coming up from the S. W., which looks very like an early monsoon. *Crops.*—There has been great failure; the total quantity of rain gauged though sufficient was badly distributed in small

showers. A second pruning will have to be done on most estates to take off a lot of useless blind wood. Few estates will give 2 cwt. an acre. *Plant-diseases.*—Borer has been seen on some estates, but not many. *Labour.*—A few ghauts have come in, and it is generally supposed that they will all be in up to time owing to the scarcity below. *Interesting Items.*—The new Sunday sante at Coombahully is working fairly well. Prices of grain much the same as in the Mudgiri sante.

Nilgiris.

COONOR, 27th May.—*Weather* very showery and hot since my last report. Simply grand for tea, which is flushing abnormally all over the district. Coffee planters not quite so enthusiastic, as they could do with considerably less rain and have some chance of approaching their "wood" estimates. As it is, things don't promise at all well generally speaking, and prospects are decidedly gloomy. Advances going up, though only slightly. Labour generally ample. Sickness of sorts rather prevalent.

SHOLUR, 27th May.—Temperature morning and evening in shade, 61° and 89°, respectively. Tea flushing well. Health improving and labour plentiful. Rainfall 8.41 to date.

S. E. Wynaad.

PUNDALUR, 26th May.—*Weather.*—On the 17th, 18th and 21st we have had rains. Since the 24th the weather is very hot during the day and every evening very cloudy. *Crops.*—The sowing of paddy is nearly finished, and the sowing of ragi and chamay is going on. Rice 8, ragi 18, gram 12 and salt 7 seers per rupee. *General Health.*—Fair. *Labour.*—Sufficient. *Interesting Items.*—The despatch of the coffee is come to an end. My writing to the *Madras Times* for the prevention of coffee theft on the 20th October 1892 under the heading of the Native Coffee Plantation (vide the *Madras Times* dated the 25th October 1892), since which the coffee stealing has come very much less again. My writing to the *Planting Opinion* under the heading of the Thieving Tribes as Coffee Labourers, vide P. O., dated the 9th May 1896, and this season I am glad that I did not hear of one coffee theft in this district and one or two in other districts, and I see that my writings took some effect for the prevention of coffee theft and that the theft is decreasing. M. Nuther Saib and Venekatasawmy got 28 tolas of gold from the Phoenix crushings, and the Nellyalom Ranees 15 tolas since my last report.

Coorg.

25th May.—*Weather*.—May has been a dry month, but we are having good showers now, on an average .50 cents every other day. Total rainfall for May 2-20, for the year to date 6 inches. *Crops*.—Prospects of crop are somewhat better, and a few estates will not do badly. Prices of all grain high: ragi 17 seers per rupee. *Plant-diseases*.—"Borer" shows up in young coffee, and open places with light shade. *General Health*.—Cholera is reported in some towns, brought in from Mysore. Estates free of it so far. Fever and colds common amongst coolies. *Labour*.—Sufficient for all requirements, and there is not likely to be a short supply. *Interesting Items*.—The Planters' Association will hold its Annual General Meeting on 31st May.

POLLIBETTA, 25th May.—*Weather*.—Rain nearly every day since the 18th to yesterday, both inclusive; amounts each day in most cases small, but totalling up on the whole to near an inch and over; signs of more rain not wanting. *Crops*.—Rain somewhat improved; prospects in helping to bring on what berries of the second blossom have set; but hopes of anything like good crops, except in individual cases, mostly dispelled. I hear that a place in North Coorg is expected to give an exceptionally big crop. *Plant-diseases*.—Coffee looking on the whole extremely fine with the exception of some borer showing up, and a little bug at long intervals. *Health*.—Fair. *Labour*.—More Canarese could be wished for. Contractors are being employed to push on with pitting. Estate hands employed on weeding, handling, shade thinning, &c. *Interesting Item*.—Theatricals at Club to-morrow night.

GENERAL NOTES AND ARTICLES.**Advances in Ceylon.**

It is not given to all of us to solve our labour and advance troubles in the merry Ceylon style, quoted from an Island exchange: "As an example of the worry caused to Superintendents by the labour and advance question, we learn that a well-known planter is in Colombo at present on leave, and intends to take a trip round the island, simply to get away from his canganies and their persistent demands for more advances."

Spices.

Prices for cinnamon are rising slightly, and the stocks are decreasing. Black pepper shows a great increase in stock in London, but the prices for Singapore and Penang are $\frac{1}{4}$ d. to $\frac{1}{2}$ d. above those in April last year. White pepper is statistically in a much sounder position, fully warranting the rise of $\frac{3}{4}$ d. to 1d. per lb. established in the leading sorts.

Kaffir corn.

This cereal that has been exciting so much attention in America and Australia, owing to the prodigious crops it yields even in the driest weather, is nothing more nor less than our common Indian "Jowari" or "Cholum," *Sorghum vulgare*. No less than 25 million acres are planted up with this product in Bengal alone, the yield (some $5\frac{1}{2}$ million tons, at 6 maunds per acre) being all consumed in the Presidency.

Scour in calves.

A correspondent writing on scour in calves to an Australian contemporary gives the following remedy:—"Take a two quart pot and fill it loosely with young gum leaves; pour in as much water as it will hold and boil for a quarter of an hour. Mix a tablespoonful of flour and one teaspoonful salt smoothly in as much of the infusion (when cool) as will half fill a lemonade bottle, and give it to the calf twice a day, a little less or more according to its age. I have never lost a calf under this treatment, though it may have to be continued several days or a week."

Rhea.

As we have already pointed out the present boom in the cultivation of this plant has come from home in the interests of manufacturers. Manufacturers, mind you, not consumers. This is clearly shown by the action of the Syndicate home in forming a practical monopoly by means of the patents of being able to treat Rhea by suitable machine. It may not of course take long for the trade to be established on a fair and independent position, but the present is hardly the time for men, unbacked by plenty of capital, to embark in this new venture. We do not fancy it will be long before we hear of the South India Rhea Syndicate Travancore following the example of its Ceylon congeners and voluntarily winding up their affairs.

Indian coolies abroad.

The Indian cooly is generally acknowledged to be the cheapest tropiculturist in the world. And there are few tropical or semi-tropical colonies where he does not form the mainstay of the agricultural industry. It is only when he starts on his own account, to rise above the status of a paid labourer to that of an independent farmer, that the Colonials object to him. Natal and Mauritius are both finding him a great deal too much in evidence, but they will have to give way to the inevitable in time, Queensland has had to do with her kanaka labour for sugar plantations. In Jamaica, they are still too few to cause inconvenience, and besides the island has essentially been an ultra-tropical one since its first rise as a colony. There are some 10,000 coolies, indentured and free, in Jamaica and are highly prized by their employers. In the way, it is curious to note that there are as many as 12,000 pure whites in the island.

Jubilee Bonfires.

A reader asks us to insert the following letter, with a further request to try and start the idea here, on the Hills of South India. *Que dit-on?*

QUEEN VICTORIA'S BONFIRES.

CARLTON CLUB, EASTERN

SIR,—Canon Rawnsley's Central Committee is now arranging to light at 10 P.M. on the evening of Queen Victoria's Jubilee Day—29th June—beacon bonfires shall gleam from one end to the other of our Mother-Country.

Cannot this bright idea expand to the oversea provinces and outposts of the British Empire? Cannot the Great Signal blaze from the thousand historic Heights of the Empire,—from Table Mountain and the Mattopos; from Mount Macedon and the Blue Mountains from Adam's Peak and Simla, from Mont Real and Mount Donald, from St. Helena, Fiji and the rest.

All can be achieved with ease by the mere organization betwixt of executive committees in every Colony and Dependency.

The hint itself will be sufficient and the Press will, I am confident, give rapid currency to the suggestion.

It will be a grand symbol of United Empire to know that on a particular night commemorative bonfires are blazing all round the world—lighting up a Fiery Cross to signalise peace, prosperity and progress for all who enjoy and profit by the beneficent sway of Victoria the Great.—I am, etc.,

GEORGE BADEN-POWELL.

CENTRAL HOTEL, INFANTRY ROAD, BANGALORE.

(Under English Management.)

The most comfortable and convenient for visitors.

TERMS MODERATE.

Jadoo.

Col. Thompson in writing to a contemporary cautions experimenters with his patent manure, against applying it in such a fashion as to expose it to being dried by the sun. For in such a case, the fibrous roots imbedded in the Jadoo will certainly all die off, causing a certain shock to the plant. Of course in this respect Jadoo is no different to any other manure or soil: fibrous roots dying in any and all mediums since the moisture necessary for their existence is withdrawn. To set off against this inevitable disadvantage, Col. Thompson claims of his fertilizer that no amount of rain will ever wash out its virtues. This is put down to the action of the gypsum (plaster of Paris or sulphate of lime) in fixing the chemicals in the fibre. A somewhat broad statement to make, and difficult to credit, more especially if our supposition be correct that liquid extracts may be prepared from the Jadoo fibre. Inventors are proverbially enthusiastic, so we will be charitable and merely take it for granted that Col. Thompson wishes to lay emphasis on the fact that his manure is not so soluble as pure chemicals. Otherwise, if rain cannot dissolve its constituents, how can the plant roots attack it so vigorously? For it is against common sense to suppose that the root-acids are strong enough of themselves to enable such remarkable results to be gained from the manure as are claimed by the gallant Colonel, its inventor.

Mushrooms.

To grow these successfully, the first essential is to procure the spawn bricks as fresh as possible. And this is best done by importing half a dozen at a time from some reliable seed firm in England, where the "bricks" cost about 2s. 6d. each.

It is quite useless buying them in the country, as we have ourselves personally experienced. When ordering, insist strongly on packing them in hermetically-sealed tins, as exposure to the sea air will quite destroy the vitality of the spawn. If you have got your fresh spawn, the following directions from the *Colombo Agricultural Magazine* will be found useful:—

"To grow a crop quickly, it is necessary to engender a moderately lasting artificial warmth in the material employed; yet, if possible, with moderate latent heat only. The place best adapted for their production is a rather damp godown or out-house; in this should be arranged a row of shelves at a short distance from the ground, on which the materials in which the mushrooms are to be grown should be placed to the depth of eighteen inches, and firmly beaten down. The compost best adapted for this purpose is made up as follows:— Fresh horse droppings six parts, cow dung two parts, sheep dung two parts, garden soil four parts, and fresh wood ashes one part. Before these are mixed they should be allowed to dry in the sun for two or three days to take off the excess moisture. After being mixed, and the bed made on the shelves as described above, they should be allowed to remain for five or six days till fermentation commences. As soon as a moderate heat is perceptible, the spawn should be added; this is done by making holes in the surface, about 12 in. apart and 3 in. deep; in each of these a small quantity of spawn, about 2 in. square, is inserted, after having first been dipped in tepid water; these should be slightly covered with the compost, and the whole beaten down firmly. After a month the beds should be covered with two inches of light rich soil, and the whole beaten down, and then well watered; it will now require no further attention, beyond occasionally watering the walls and floor of the room to promote a damp atmosphere. If properly managed, the beds should commence bearing freely in about eight weeks from the time of spawning them. On the plains the best time to start a mushroom bed is from September to March; in the hills from April to October."

Malarial Parasite.

At the last annual meeting of the U. P. A. S. I., it was resolved that the Secretary be instructed to move the Government of Madras to commence an enquiry into the question of the development of the malarial parasite on somewhat similar lines to the investigations undertaken by Surgeon-Major R. Ross and others; and the Association trusts that the theory as further developed by Surgeon-Major Ross and explained in his pamphlet on the subject, will be thoroughly investigated on the same lines as the investigation of cholera by Drs. Haffkine and Hankin. The Surgeon-General, to whom the above recommendation was referred, considered that the only means of meeting planters' wishes was to appoint a special Medical Officer to work solely at the subject of malarial parasite; and the Government of Madras addressed the Government of India. The latter authority has now intimated that in view of the present financial position and the urgent calls on the Medical Department for other duties, the proposed enquiry must be postponed for the present. A distinct promise is given, however, that the matter shall not be lost sight of, and, though they may regret the delay, planters will no doubt feel that it is unavoidable and that Government has decided wisely. It is not planters alone who will be disappointed, for, with laudable zeal, Surgeon-Major Ross applied, last October, to be placed on special duty for a few months in order to investigate the truth of Dr. Patrick Marson's theory of the Transmission of the Infection of Malaria by means of the Mosquito. It is to be hoped that a favourable answer may yet be returned, even though the exigencies of plague and famine will not admit of this being done at present. Meanwhile, the planters of Southern India have reason to congratulate themselves on the sympathetic manner in which the local Government has supported their efforts to promote scientific investigation with respect to matters affecting their industry. Another instance of this sympathy might be cited, with reference to the interesting subject of "Coffee-scale and Lady-bird" raised a few months ago by Mr. Howard O. Newport and promptly taken up by Government at the suggestion of the Hon. Mr. Hodgson.

Christian coolies.

Writes a much disgusted planter: "Why is it that the Native Christian is usually a scamp, lazy and insolent? He struts about under the mistaken idea that a pair of trousers European shape (!) and a coat and his religion put him on an equality as it were with his master.

"The missionary as a rule works hard enough in all conscience. I do not mean the gentleman who lives in the hills all the year round and drives about in a carriage; he is beneath our notice. The man I mean you will find if you look for him sweating his life out in the plains, poor beggar, with a run to the hills every five years or so, if he can afford it, giving up his life and health to be able to do his duty, or what he considers his duty. I do not wish people to think I look at mission work as humbug, far from it. I've seen too much of it not to know its hardships and privations. I've seen men living at 3 As. a day in a pestilential climate out of a sense of duty. They were fed and housed by the mission and doctored and allowed £20 a year for clothes and any private luxuries, but only a few drew this, and they were those who had no private means and there were some who had ample private means, gave largely to the mission funds, but this was not an Indian Mission.

"But to return to the main point, why is it that a Native Christian is mostly below the average of his heathen friends, for one must judge by results in mission work as in anything else? A planter would be thought a bad planter if he only turned out bad tea, if half the estate was poor jat, and only half good.

The missions have much against them; in this way most of their

converts are of the lowest castes, Pariar and Pallar, and such like. These men left to themselves and worshipping their own gods would never be up to *very* much, and somehow the missionaries do not seem to be able to get hold of the higher castes and a good thing, too, in some ways. A high caste native is forbidden drink by his religion as is the Mahomedan. Make them Christians and they at once begin to drink, and it is not as if they could hold their liquor or know where to stop; they don't and seemingly never will.

"You may, speaking roughly, say all Native Christians drink, and too much too.

"If the missionaries would keep them sober they would do a lot of good, and if they taught them a trade, so much the better; but instead of that they educate them, half educate them I should say. Fill them up with the outward forms of religion with never a thought of what sort of *men* they are turning out.

"They teach them to read and write, *cui bono*, and to talk our language, and they (the converts) make use of their knowledge to listen to all we say, read our letters, &c. The converts hear the mission people talking of planters as an unregenerate and unconverted lot of infidels, and morally pat themselves on the back and think they are better than we are. When this is the case, can you wonder when planters reciprocate the dislike and decline to employ Christian native labour. Amongst the Kaffirs in Natal, if you want money you must send to the town 200 miles away; get a *raw* native and trust to his honour and you will not lose a penny. Try it with a *mission boy*, and you may whistle for the cash once it's been in his hands.

"Now all other things being equal, I'd rather have Christian coolies, but as they are not equal, give me the heathen who goes and worships his swami under the big fig tree and *believes* in him. I want no "Kistin boy," not by any means."

And so say all of us!

CASUAL JOTTINGS.

In reading the prefaces of some books, avowedly addressed to myself in the term of "you, the gentle reader," I have usually found myself in the position of the respectable Christian when he pretends to believe he is a miserable sinner. That is, I have always imagined the preface or prayer addressed to some one over my shoulder. So, though I want to get at the reader (yes, *you*, who are glancing over these lines sleepily, wondering what the deuce my last "Theory" is) personally and directly, I don't quite know how.

Being holiday time, Mr. Editor, I don't doubt you will spare me some of the space your deftly-wielded scissors often fill. Ha! *touche*? You know, you (very unwisely, no doubt) hinted to me in a weak moment that my scribbles might now and then, at long intervals, be of some use. If only to put some head on your own heavy planting liquor. As a young planter, strong in the impartial conceit that full-fledged ignorance bestows, I am of course entitled to teach all my elders to suck eggs. You can cut all the above right away, as I'm just beginning to find out what I want to write about.

And it is all about "why planters should never write to the papers." Least of all to their own trade journal. To begin with, it would perhaps tend to lessen some of that savage self-conceit only bred by abnormal growth of angles and peculiarities, allowed or encouraged by isolated planting life. It might be called rugged independence, with more politeness if less candour. It would indeed be a bitter shame to rob an honest man of perhaps his greatest virtue, would it not? So on no account, my honest rugged reader, set you down to your table and exchange ideas with your fellow-planters.

It is so awkward too, you know, to find your pet idea given with so much confidence to a doubting world, cut up by abnormally critical correspondents. And yet up to the day, you felt so perfectly sure that you were right in your methods. So sure, in fact, that you felt them to be too patent to write about.

For instance, do you remember that great row in the Club with Green, which began in your arguing that because cereals were not perennials, English agriculture couldn't teach coffee-planters anything they didn't know before? I won't hurt your feelings by repeating the argument at length, but I can't help sighing at the abrupt way you pressed the conclusion down Green's throat. You shouldn't have used your fist though; now should you?

To the impulsive planter, nothing is more tiring than newspaper controversy. He doesn't seem to get any forrader with it. No opportunity, in this doucely conducted journal at least, to have a good old slanging match. He must just confine himself, if he can, to the argument. And as he can't, why, he just sticks to his long chair.

TOMMY'S LOVE.

I DON'T mean his first love, nor his last. Simply Miss Bella Smith, up to Mercara from Mangalore for the hot weather. And she was a dear little girl too. Not very pretty or very clever, but she had brought a bit of English sky with her in her grey-blue eyes. Tommy said he felt as if he were at home again when he was staring particularly hard into those same eyes. He certainly looked it, very much at home indeed.

One evening, after tennis on the flag-stone court in front of the Court House, they went their usual stroll round the old fort. Talking of all things in heaven and earth, and a good deal that belonged to neither, the conversation turned to the "Very Modern Woman." Miss Bella and Master Tommy were on rather intimate terms.

"And what do you think of this 'newspaper myth, whom no one has ever seen out of the columns of the comics?" quoth Bella, with her steadfast eyes fixed full and square on Master Tommy's ingenuous countenance.

"Rare good sort, I should say, don't you know. Ever so much better to stand on her own hook than cadge round on all the men. Admire a girl like that immensely. Though—" Here Tommy stopped and enjoyed the English sky of her eyes.

Miss Bella had seen a good deal since she first came out to India to join her brother—a padre of sorts—in his Mission work on the West Coast. Tommy was a happy young planter, wise after the fashion of his race in much out of the way love. This is by way of introduction.

"Of course, the 'Very Modern Woman' really goes too far," Tommy went on, the sky getting overclouded. "Riding a bicycle, working for her living, going about in open masculine dress is all very well. But when it comes to—well, you know, other things, hang it—" He broke off short, confused and uncomfortable. As well he might. He changed the conversation.

"I say, Miss Smith, do you know what your—"

"What my eyes remind you of? You have told me twice already. Jungle life does make you planters so dull

y something else. Ah, there's that nice man, Mr. Tweedale! I'm so glad he's coming this way. I think he a credit to your community, always spick and span, even his plantation. What do you say? Well, goodbye. How do you do, Mr. Tweedale?" she rattled on, as this gentlemanly individual stalked up. Poor Tommy, I always felt for him so.

A PLANTER IN AFRICA.

I WAS tired of Ceylon, and got an offer of a good billet in German East Africa; and being told the climate and shikar were good, I jumped at it. The climate is rather warm in the plains, and delightful in the hills, until you stir up the soil, when it's fearfully feverish: pucca black-water fever. And as I came out as a planter, the results were inevitable. First thing I had to do was to drain out a lot of swamps, which was something like cleaning out cess-pools. The planters are mostly Germans of sorts. One was a very decent chap, rest were an awful lot of bounders. My brother Englishman made me a trifle ashamed of my nationality. I landed at Tanga on the coast in October 1893. Lovely harbour, Tanga, land-locked on 3½ sides, large enough to float ships of 4,000 tons at present. I marched up country: took me 2½ days in the very long marches of 20—30 miles a day.

First thing I did after planting up a ten-acre patch was to go down with fever for a fortnight. I got better, and my other Englishman on the tote had a row with the African labour and left for the coast. I couldn't speak a word of the language, but quickly gathered they thirsted for the other man's blood. The plantation was only 90 acres planted, 50 more ready to plant, and at the end of the year we got it up to 350 planted. The "reserve" was a block of 275,000 acres. Lots of room for extension! All coffee, except two acres of wretched tea. Grew lots of native food, arrow-root and so on for estate consumption. Leaf disease first appeared some three months after I arrived in the oldest coffee about 15 months' old. Started on one or two trees, and I promptly spotted it and reported it to my boss and in fact the whole district. No one believed it at first and said I was drivelling. I burnt the affected trees at once, and sent specimens of the leaves to Kew and Berlin. Before we could get an answer, the pest had increased to such an extent that confirmation of my surmises was no longer needed. On making enquiries I found that the seed had been purchased in Colombo by the German Consul. It was reported that he bought the seed ignorant that it was to be used for planting. Ten per cent. at least was light. Of the balance only about 30—40% came up fairly strong plants. The best of these were planted out with the above result.

The course of the disease ran curiously. It took a strip away from the lines right down a field. Then it worked back over a ridge through a break in the wind belt to another clearing, where there were two very large nurseries. There it played mischief with. These plants were put out and the whole estate got affected. I left before the full results could be seen, but I noticed the only unattacked portions were some line coffee and a little bit of a shade clearing. Nearly all the rest of the coffee was in the open, pucca Ceylon style, barring a few odd trees some 40 to 60

feet apart, that were only left because they were too big and expensive to cut down.

"WANDERER."

(To be continued.)

FRUIT PRESERVATION.

IN view of the immense market which may one day be open to some of the luscious fruits of India, the following results of cold storage tests at Dartford may prove of interest:—An interesting experiment in the preservation of fruit by means of cold storage has been carried out during the past season by the Technical Education Committee of Kent County Council at Dartford. The test has been superintended by two members of the committee, Messrs. Hesketh and Chambers, whose reports are now issued. They state that the stores were kept at steady temperatures of 30 deg. and 40 deg. until near the end of the year, when it was considered there would be no further utility in prolonging the experiment under the same conditions. Mr. Hesketh's report proceeds:—This fruit loses weight somewhat during the refrigerating process, as is evident by the amount of moisture collected off the brine walls, which amounts to 1·5 per cent. of the weight of the fruit per week. The moisture is absorbed from the fruits by the air during its natural circulation in the chamber, and deposited on the colder surfaces of the brine walls, from which it is drained away. The air is thus kept in a dry condition. An object in future experiments will be to reduce this desiccation of the fruit, but still maintain the dry condition of the air which is so essential in avoiding mildew. A careful log has been kept of the working expenses, and this shows that the total cost of engine power (gas at 3s. 6d. per 1,000 cubic feet being used in an engine) and all stores amounted to 8·9d. per day. This does not include anything for labour, as only the occasional attention of a labourer otherwise employed is required. The cost of working by an oil engine would be approximately the same. The refrigerating machine, which is the smallest size practicable, was capable of dealing with a much larger chamber, its average hours of working per day being only three and a half. If an average of twelve hours a day for the working of the machine is taken, it could then maintain a store 24ft. by 24ft. by 8ft. high, which would be capable of storing some 2,000 bushels of apples. The cost of working the machine on such a chamber, based on the experience gained in the recent experiment, would be 2s. 2d. per day. Of course larger installations would cost much less to work in proportion to the quantity of fruit kept. It is proposed to make experiments during the coming summer on the soft fruits as they come in season. In that portion of the experimental work managed by Mr. Chambers, 4½ bushels of fruit were stored in the chambers for 101 days and 35½ bushels for fifty-six days. Mr. Chambers states that some of the summer apples left in the store until the close of the experiment were found to be sound, but were not so good in flavour, and were somewhat soft. On the other hand, the winter apples were of as good flavour as when put in, and were fully as hard and sound.

RUBBER GROWING.

The *Australian Tropiculturist* for March has a special article on this subject, referring to the industry as a new fortune-promising one and calling upon the Government to plant up all available coastal areas, since "flat alluvial river lands are regarded as the best soil for Indiarubber trees."

Regarding *Castilloa*, it is said that the tree thrives best in moist but not marshy forests, on a warm sandy clay.

For each plant a hole should be dug 3 ft. in diameter and 1 ft. deep, and filled with fine loamy soil to which a little sand has been added. The mixture should be well trodden down and watered night and morning for two days, when it is ready for the young *Castilloa*, which must be placed in its new bed at exactly the same depth as in the nursery; if it is weak, a stack support is very desirable.

To this might be added that the young plants should be at least 15 feet apart. But it cannot be reiterated too often that the locality must be a sheltered one.

A curious fact about the *Castilloa* is that frequently natural ropes of rubber are found hanging from the tree formed by the tapping

of the bark by wood-peckers, the exudation of the creamy sap that coagulates as it trickles slowly down.

The method of harvesting the sap is as follows:—Immediately below the first branch a horizontal canal is cut, V shaped; from the point of the V downwards a perpendicular canal is cut till it joins another horizontal V, and so on down to the ground. The sap is guided into a receiver, and the water in it evaporates. Evaporation may be assisted by artificial heat, and coagulation is forced by an agent. Then Indiarubber is formed. The canals should be plastered with mud or clay, to protect the life of the tree.

The quantity of rubber produced from the sap depends largely on the coagulating agent used. Sixty per cent. *ought* to be converted into rubber. An ounce of alum in a pint of water (not Imperial pint) is a good agent; a weak alcoholic solution is better, because speedier.

The commercial profits in the rubber trade are so enormous as almost to challenge belief. The traders who deal with the natives purchase for mere civilised trumperies hundreds of pounds' worth of rubber; these sell at the last-named price to the merchants; what the merchants make would be difficult to estimate. So long as this system is open to the enterprise of the New Guinea pioneers trading in the interest of Melbourne and Sydney syndicates, they are not likely to trouble to preserve the trees!

As one object of this article is to show that rubber-cultivation may be more profitable in the long run than rubber-piracy, it is necessary to quote figures as to profits made by such cultivators. Here, unfortunately, one has to go to the other side of the world for startlers. A typical estimate of a 500-acre rubber farm in Nicaragua made the eighth year's profits £44,337 10s.! "And the yield increases every year, with no outlay except for weeding and harvesting."

This calculation could scarcely apply to Queensland, because the cost of even kanaka labour would be more than that of Nicaraguan. But in a plantation of trees planted 15 ft. apart, coffee, sugarcane, and other shade-loving plants, yielding yearly crops, might be sown.

The life of a rubber-tree has never been exactly stated, but the New York *World* mentioned in 1892:—

"Three young trees transplanted from the forest to a cultivated field in Soconusco, Mexico, are now said to be seven feet in diameter, and have yielded rubber for more than 35 years; the present product averaging more than 50 lb. of gum per year."

The average increase is estimated to be 1 lb. of rubber for each year of the tree's life up to a certain age. Trees tapped in the wet season are said to yield five times as much milk as when tapped in the dry.

WYNAAD PLANTERS IN THE FIFTIES.

It was nearly 38 years ago that the following letter was written to the then Ooty paper, but things do not seem to have advanced very far since those days:—

COFFEE PLANTERS IN WYNAAD.

TO THE EDITOR OF THE SPECTATOR.

MY DEAR SIR,—A great deal has lately been said and written about Wynaad and the good things in store for the Planters, but very few people out of Wynaad have an idea of the troubles, difficulties and vexations, by which they are beset, and how these troubles are augmented by the wretched laxity of the native officials—the only description of official we have in this part. So well are the natives aware of the almost impossibility of a European recovering an advance, that the headmen of the Pardies or villages, will sign *any* agreement, and bind themselves under *any* amount of penalty to get an advance, and the manager is indeed fortunate who succeeds in getting his advance worked off clear.

We are told that, as a breach of contract, it can only be dealt with in a Civil Court. I will mention a little experience of my own. About 32 months ago, being determined to try what could be done in this Civil Court, (though I was laughed at for my pains) I employed a Vakeel, paid him 50 Rupees for commission, stamps, peon's batta, &c., &c., and entered a few suits against certain Moplas and Cooroombars who were considerably indebted to me. Each of these men had signed an agreement before witnesses, and bound himself under a heavy penalty to perform his contract. Up to this time, *nothing* has been done, nor do I see the smallest probability of anything being done.

So notorious has this state of things become, that a Mopla or Cooroombar maistry will laugh at you when you threaten him with the Court. If a Moonsiff's peon is sent to their village to serve summons upon them, a bribe will prevent their being found. The only chance you have is to promise a good enam yourself and then a risk is run of your being outbid.

A few days ago, a notorious thief was found on a neighbour's estate. He had broken into the rice store, and helped himself to much rice and tobacco as he could well carry; he was watched, secured close to the store with the stolen property on his person. The Ameen's peons were sent for to take charge of the fellow, though only seven miles distant, they did not make their appearance for three days. In the meantime, one of the Police peons, at the request of the Tambercherry Ghaut, was sent for, but the messenger returned to say that the peon refused to come, as his comrade was absent. For three days then this thief was secured and fed by the manager of the Estate. At last the Ameen and staff make their appearance, and from the attendant retinue, one might have supposed that summary justice was about to be administered. Not so however. The prisoner and his booty are taken charge of, and the manager—wiping up to his eyebrows in work making the most of the rains to get his land planted—is given to understand that the case cannot be tried in Wynaad, but that he will be required to send a lot of people to his Estate to Tellicherry and either appear there himself to prosecute or empower some one else to do it. In Wynaad, we have a Tahsil, a Moonsiff, an Ameen, and a host of other native officials. Yet a simple case of theft discovered may probably entail the necessity of a manager leaving his Estate, at a time when his presence is essential to go some 50 or 60 miles, taking with him a number of his peons. With reference to advances I fear no contradiction when I say, that we planters are systematically robbed and that literally without remedy. We can get no labour without making large advances, and in many, many instances, though the advance is made under a promise, with a heavy penalty for non-fulfilment, the receiver's face is never seen again. Most likely he is cultivating a piece of raggie land with two or three advances previously obtained from other victims.

We have been told a European Magistrate is to be appointed to Wynaad with power to deal summarily with advance cases. His distance however intervenes, and the natives evidently don't believe in it, or they have determined to make a harvest before he comes. There are upwards of 40 European Planters (proprietors and managers) now in Wynaad, and our numbers are yearly increasing, but really things are becoming so rapidly worse and worse, that some, who would under other circumstances go more largely into Coffee cultivation, are being driven back. Mysore is fast failing us for labour, and in proportion more is required so is the supply less. There is but little encouragement to any private individual now to open a Coffee Estate. Heavy hill work, much exposure and a great prospect of losing large sums in advances, are evils which array themselves before the would-be cultivator.

Pray excuse my trespassing so largely on your columns, but I think the present state of affairs in this feverish part of the world should be known. Hoping on still for a "good time coming,"

I am,

Your's very obediently,

GROWER

BACK WOODS, 28th July, 1859.

POTASH IN PLANTS.

THE NEED FOR SPECIAL POTASH FERTILIZERS.

SOME months ago we referred to the belief, says the *Agricultural Magazine* of Ceylon, that was gaining ground in agricultural circles that the value of potash in agriculture was not correctly estimated, and that much benefit was to be expected from a more extended use of kainit and other special potash fertilizers. In countries where particular use is made of ashes, it has been thought sufficient to use them for supplying all the potash that is considered necessary for cultivated plants. The amount of potash in wood ashes and other refuse substances used for supplying this ingredient is never uniform quantity. Thus wood ashes that are supposed to contain 5 per cent. of pure potash are frequently found to have not more than 2 or 3 per cent., and the difference in the potash value of wood ashes cannot be detected by its appearance.

We have just been favoured with no less than three publications

reference to the value of potash in agriculture, two referring to the results obtained in the United States and one dealing with experiments in Britain. In the last mentioned, entitled "Potash Manuring—its value to British Agriculture," the authors, Dr. Aikman and Prof. Wright, state that the necessity for potash manuring has not hitherto received the recognition that has been accorded to the case of other two important plant foods, and that they (the authors) have set themselves to examine the cause of this comparative neglect of the potash manures, and to consider how far the neglect is justifiable in view of the results of a number of recent experiments.

It has not yet been made quite clear what function potash exactly performs in the plant, but that no plant is able to grow without it has been proved again and again. Soda, which is an essential element of plant food, was at one time thought capable of replacing potash, but this was shown to be false. No other substance can replace potash which is a necessary constituent of all plants. It is a noteworthy fact that even in plants grown in the vicinity of the sea potash is more abundant than soda, although the latter salt is thirty times more abundant in sea-water than the former. The quantity of soda varies very considerably in plants according to circumstances, but nothing like the same variation is found in regard to potash. Its functions in the plant though not well understood are known to be important—more important than those of any other ash constituent except phosphoric acid. According to Liebig it plays an important part in the distribution of the carbohydrates throughout the plant. It is always to be found in the actively growing parts of vegetation, as in the growing buds and roots, and exists in relatively large proportions in the seed. In wheat grain, for instance, potash forms 31 per cent. of the ash, while in the stem it forms less than 14 per cent. In the ash of plants potash occurs chiefly in the form of phosphate, chloride, and carbonate. It is believed that most of the potash is absorbed in the form of sulphates and phosphates, and probably also as silicate. In whatever form it is absorbed it has at any rate been proved beyond doubt to be absolutely necessary for the growth of crops.

It is a generally accepted principle of manuring that potash manures need not be applied to clay soils which are considered to always contain a sufficiency of the constituent. Actual analyses and experiments on the field have shown, however, that this reasoning is not quite reliable. Though the presence of a fair proportion of clay in a soil may be accepted as a guarantee of the presence of potash, it is not always so. There are soils containing much clay that do not contain much potash. It has been found by experiments that potash manures produced a large increase of crop, though the field to which the manures were applied was of a stiff and clayey nature, such as would be described as a stiff clay loam.

Again, potash may be present without being effective. The ordinary methods of chemical analysis can determine the amount of potash in the soil, but of that amount it may happen that the greater proportion exists in a condition in which crops are unable to make use of it. The ordinary solvent agencies in the soil have but a limited power of dissolving insoluble compounds in which it chiefly exists, and that too only on the limited region of the soil particles with which they come into the most intimate contact. Hence a soil may be rich in potash, and yet that potash, or the greater part of it, may be quite unavailable, or be available in quite insufficient quantity for the needs of the growing crop which might, therefore, largely benefit by the application of an artificial potash manure. Before it can be safely concluded, from its composition only, that a soil will not be benefited by potash manures, it is necessary to know not only that the soil contains much potash, but that it contains it in a form in which it is readily available for the use of plants.

Some soils contain as much as 3 or 4 per cent. and more of potash, while the soils which are generally poorest in this constituent are sandy and peaty soils, and these latter are generally found to produce a considerable increase of crop by the use of potash manures.

The variation in the amount of potash soluble in water in a soil usually ranges between a thousandth and a hundredth per cent. The remainder is usually present as hard insoluble compounds which are not available for the plant's needs, and only very gradually, with the lapse of time, become so. There are, however, certain compounds which, while not soluble in water, are believed to be more or less available for the plant. The water in the soil, by virtue of carbonic acid and certain other organic acids which are dissolved in it, has a greater solvent power on mineral substances

than pure water, and this solvent power is further aided by the acid nature of the juices in plant roots. A striking instance of the power of roots to dissolve insoluble substances can be seen in nature by tracing the roots of such plants as ferns that appear to cling to the bare surface of rocks.

Dr. Bernard Dyer, who has been endeavouring to estimate the dissolving power of soil water and plant roots on mineral substances such as potash, has come to the conclusion, after a large number of determinations, that the sap acidity of roots is equal to a one per cent. solution of citric acid. Testing certain soils with a solution of this strength he has found that the amount of potash available is very much greater than that indicated by testing it in pure water. Thus in two soils, in which the total amount of potash present was about $1\frac{1}{2}$ per cent., the available potash was four thousandth and three hundredth of a per cent. respectively. This is much more than could be dissolved by pure water, yet this result also shows that only a very small proportion of the total potash in the soil may be regarded as immediately available to plants. Of this small proportion available, it must be noted also that a loss by drainage of the soluble potash in the soil is constantly going on to a greater or less extent.

In our next issue we shall continue our notice of the interesting pamphlet referred to by Dr. Aikman and Prof. Wright, so as to place the latest information with reference to potash in soils and potash manures at the disposal of our readers.

LETTERS TO THE EDITOR.

NOTICE TO CORRESPONDENTS.

["Anon." Very sorry your copy-right in this *nom-de-plume* has been infringed. Would it not be as well to choose a slightly more original one, we have a hazy recollection of seeing it before, you know!

SPONGING HOUSES.

DEAR SIR,—There is one thing I should like to warn my fellow-planters against, and that is staying in a Ceylon Hotel. There is no need to explain the meaning of Sponging House to any readers of *P. O.*, to most of whom it will be associated with a perusal of Dickens and Thackeray and a savour of Chancery Lane as it was before imprisonment for debt was done away with. A Sponging House may fairly be called a reminiscence of a past generation, but that they exist at the present day, any visitor to a Ceylon Hotel can vouch for. In the planting metropolis (Kandy) of Ceylon, according to a letter of the Manager of the Queen's Hotel, the authorized charge for a whisky and soda is 80 cents of a rupee (8as. for whisky and 5as. for a soda). Why not charge half a crown a drink while they are at it? Another charge made in the same Hotel is even more monstrous, 10as. for a cup of tea. We all know Ceylon Tea is an extremely valuable commodity, being worth on an average about 8d. a lb., and presume that the charge of 10as. a cup is based on the value of the tea, but all planters will consider a charge of 10as. as going one better than the old-fashioned Sponging House.

"VERITAS."

GARDEN PLAGUES.

DEAR SIR,—Perhaps you or some of your readers could inform me where I can obtain some good "bird lime." I believe they make it in Madura or Tinnevely, for long ago I read that bears were captured with bird lime. On a moonlight night a dozen men armed with spears and bamboos sallied forth for the haunts of Bruin; the ends of the bamboos were covered thickly with bird lime; directly the bear was seen, a dozen bamboos were plunged into his hair and twisted, so that the captive could not move; then the spears made an end of him.

I want the bird lime for my fruit. The Italians capture

such thieves that come for figs with strings coated with bird lime, stretched from pole to pole, and thus not only preserve their fruit, but secure a supper of little birds.

My tormentors are bulbuls in hundreds; to them nothing is sacred, from peaches to apples. There are other depredators, such as two kinds of *Paradoxurus*, one very like another in its fur; the other has long hair. They climb trees and eat every kind of fruit, coffee especially; one fellow devoured six thorny opuntia fruit, and was none the worse for the thorns; a short time after he fell a victim to a spring gun. In his stomach were found seeds of coffee and cherry moyer.

For rats and squirrels a figure of 4 trap and a heavy stone keeps them in check, but the birds are my trouble. A gun in a garden does more damage than good.

AGRICOLA.

IMPROVED COFFEE SEED.

SIR,—I have not been able to reply to "I's" letter in your issue of April 17th before. Allow me to state that the remark which appears therein, viz: "We have however reason to believe that Mr. Grey's ordinary seed was from poor quality" is not correct, and he has no "reason" whatsoever for making the above statement! It was a fair sample of "unprepared" seed coffee, bushels of which are sold every year from Rs. 30 to 35 per bushel.

"I" is quite correct in stating that Mr. Cochrain's analysis of Ceylon coffee showed 4.40 per cent. of "ash," but Mr. Hughes could only find 3.30 per cent., and is, I believe, a truer test.

"But" (a big B please P.D.) will Ceylon show that now (a sample from that Island will oblige!)

The moisture shown by Mr. Hooper was from the "prepared" seed.

To go back to the "wonderful" nurseries "I" has seen, has it ever struck him that nurseries are now *freely* manured, backed; are used filled with *good jungle soil, etc. etc.* Let "I" make up a "bed" on "ordinary soil" and put in his seedling as used to be done 20 years ago and report result. I think he will look in vain for a *decent* plant. I honestly believe the whole secret of getting supplies to come on commences in the *nursery*; if the seedling is a poor one, it is bound to suffer when put out in the field. (I am not thinking about new clearing; that is another horse altogether, but the successful rearing of "supplies.")

Is it a fact that "I's" statement in the latter part of para. 2 of his letter under reply is correct? If so, how is it one hears so much about "I can't get my supplies to come on"! "Do what I will, my young plants go back directly I put them out," etc. etc.!!!

"I" says secondly if "my ordinary" seed is a fair sample, then coffee in S. I. is in a bad way, and I rather fancy "I" is right if he will study the following figures of coffee seed from three or four leading districts, the same being what these districts sell as "seed," I believe:—

Nellacotta	... 2.7 ash with parchment,	2.6 ash without parchment.
Coonor	... 2.1 " " 2.1 " "	
Coorg and Mysore	2.9 " " 2.8 " "	
My ordinary	... 2.6 " " 2.6 " "	

My "prepared seed" show the following, 7% ash with parchment and 3.7 ash without parchment, and it is now left with my brother planters to judge which is the best.

The most important point in "I's" letter is the following question:—"When a seed containing parchment....., does the parchment in ANY way assist towards contributing sustenance to the seedling?"

I referred this question to Mr. J. Cameron, of the Botanical Gardens, Bangalore, and this is his reply: "In the coffee seed, the seed coats (one of which is called parchment by planters) contribute food material first to the cotyledores (seed leaves)

and subsequently through the latter to the embryo. In the early development the cotyledores of a coffee seed are very small, but during germination they grow very rapidly at the expense of the reserve material in the seed coat and eventually fill the whole space in the seed, the coating falling away in their shreds. The so-called coffee bean is a mass of horn substance reserved in the seed coat. The outer covering (berry) has usually a protective function, although at a certain stage of maturity it may also contribute towards the sustenance of the vital core (embryo) it is the final base to draw supplies from.

The above statement should satisfy "I". I have written Dr. King of Calcutta on the subject, and on hearing from him will send you his reply.

"Toda's" letter on 17th April, P. O., ought to interest "I". "Toda" seems to have some difficulty in getting his supplies to come along!

May 22nd.

L. W. GREY.

COST OF LIVING ON A PLANTATION.

I.

SIR,—The following facts may be of interest to some of your readers. My monthly expenditure for food and servant is as follows:—

	RS.	A.
Pay of butler	...	15 0
Weekly bazaar @ 3-12	...	16 4
One tin kerosine oil	...	3 0
Bread	...	2 0
Milk	...	1 0
Tea	...	1 0
Porridge 1 tin	...	1 6
Butter	...	2 0
		41 10

The bazaar account includes meat, vegetables and fruit, and lots of both. Price of meat $2\frac{1}{2}$ to $3\frac{1}{2}$ annas per lb.

I don't say this is exactly luxurious living, but with the extra Rs. 8-6-0 to make up the round Rs. 50, one can get along fairly well. And I have lived, too, a great deal cheaper. For over 18 months my monthly food and servant bill ran to only Rs. 35. Any young planter should find Rs. 75 per month sufficient for food, servant, smokes, a drop of whisky, and plantation clothes.

Yours faithfully,

EX-CREEPER.

II.

SIR,—In the number of the *I.P.G.*, dated May 9th, 1897, a letter from an Indigo assistant in which he bewails the smallness of his pay and the impossibility of making ends meet. Below is his letter:—

PAY OF ASSISTANTS IN INDIGO.

A Correspondent writes:—I am sending the enclosed account as a statement of my expenses per month. These have been made up carefully and I think are fairly correct; but I have left out a few things that would immediately be dropped upon as luxuries.

Also in a few places it may yet be disputed, but this statement as I feel fit to expend.

Assistants' pay seems to have remained unchanged for years, but have other things remained so? No, by no means! Bearer's, servant pay has all been increased, even fowls are more expensive. Rice, believe, could have been got at 8 seers a rupee, is now at 10 seers and in proportion it is the same with other grain.

No, it still remains a puzzle to me how the assistant pulls through on his pay, and I trust some one else will send up their account as well.

It has long been urged that our pay ought to be raised; this cannot be done unless we combine; let us start by a correspondence in the *Indian Planters' Gazette*, and that afterwards will give us a basis to work upon, and courage to bring it properly forward.

	Rs.	A.	P.	Rs.	A.	P.	REMARKS.
arer	7	0	0				
ansama	6	0	0				
hter	6	0	0				He gets extra for other work.
ok	6	0	0				
obi	4	0	0				
salchi	1	0	0				The rest is paid by factory.
unkhawala	6	0	0				
rden Cooly	2	8	0				
arwah	2	8	0				
bu	8	0	0				Not supplied during these months by factory though necessary.
ass cutter	13	8	0				
od	25	0	0	62	8	0	
hisky (3 bottles)	9	0	0				
Soda	4	0	0				
Beer, Bass, Rs. 7-8 doz.	18	0	0				
a, 2 lbs.	2	0	0				
gar	3	0	0				
cocoa	2	0	0				
obular Salts and Saltpetre.	5	0	0	68	0	0	
rain for horses	20	0	0				
ood for dogs	12	0	0				Rice 10 seers a rupee.
uffalo's food	3	0	0				
able necessities	3	0	0	38	0	0	
stamps	4	0	0				
ub subscription	5	8	0				
undries	2	0	0				
				11	8	0	
income tax Rs. 3				6	0	0	
doctor's fee „ 3							
				186	0	0	

Pay Rs. 150 and Rs. 25 horse allowance=Rs. 175.
This leaves you Rs. 11 to the bad monthly, leaving out expenses for tobacco, medicine, stores of any kind, books, any saddlery, clothes, and subscriptions, parades or meets.
3rd May 1897.

AN INDIGO ASSISTANT.

It strikes me that he has got more servants than he wants. Bearer I pass. Mehter ditto, cook ditto, also punkhawala and nati, and dhobi. The masalchi also is needful, that gives six servants for this exacting young man. He can quite well do without his Khansamah and Babu and Charwah. He puts down Rs. 13-8-0 for grasscutter. How many ponies does he keep. Food Rs. 25 is ample. Whisky, soda and beer, well it all depends what a man drinks, but I thank my stars I am not such a sink. I am not a teetotaller by any means, but I find a bottle for myself and another one or two ample for passers by and two doz. of soda.

Tea, sugar, cocoa, well and good, but I don't know what he wants with saltpetre, unless in cartridges. It can't be medicine, for he says medicine is not allowed for. Gram for horses Rs. 20. How many ponies does he keep? Two tats should do his work, if he does not mind a small amount of walking.

Buffalo's food Rs. 3 and stable necessities ditto are all right, as are also the balance, stamps, club subscriptions, sundries, income tax and doctor's fee.

I grant the pay is small and it is a pinch, but his estimate of expenditure is in my mind excessive.

In Kashmir my expenses were about the following, not counting luxuries:—

	Rs.
Food	35
Kitmudgar	10
Cook	12
Dogs	3

	Rs.
Pony and syce	17
Liquor and tobacco	12
Mehter	6
	Rs. 95

In Ceylon an assistant begins on Rs. 83'33 cents and a kitchen cooly.

Food may be put at	35—40
Boy	17—20
Dogs	0—4
Liquor	5—15
	57—79

This of course means very plain living, pinching in fact in every way.

Up here, I am compelled by circumstances to live as cheaply as possible for the present, and I find I can do it for about Rs. 55 a month.

	Rs.
Servant	15
Food	25
Liquor (Nil)	0
Tobacco	5
Medicines, etc.	5
Sundries	5
	Rs. 55

I should not have thought it possible till I tried it, and it's not nice. But I wonder what an Indigo assistant would say to it.

ON THE CHEAP.

MANURING TEA AND FLAVOUR.

SIR,—A few weeks ago you quoted an "old and experienced planter's" remarks on the vexed question of tea and flavour. The writer takes it for granted that the point has been settled once and for all. Allow me to disagree with him. It is so easy to make an assertion, but, as your correspondent may find out, rather more difficult to demonstrate its correctness. Whether it pays or not to manure is another question, altogether outside of the present argument.

The flavour of tea may, or may not, be affected, adversely or otherwise, by manuring the bushes. According to my ideas, it depends

- (1) on the state of the bushes;
- (2) on the condition of the soil;
- (3) on the quality of the manure;
- (4) on its quantity.

If the bushes are in vigorous life, the manure should, I think, be applied very judiciously indeed, for extra-quick flushes cannot fail to be inferior both in flavour and quality generally. Especially if the soil also be good to start with. On the other hand, if both the bushes and soil are poor, manuring may be undertaken with confidence, as slow, hard flushes all the year round cannot fail to give most inferior tea.

Touching on the quality and quantity of manure. These can only be rightly discussed when a knowledge has been previously acquired of the condition of the soil and bushes.

It must be remembered, however, that besides the actual "flavour" of tea, a very important point is that of "body" and "strength." In other words, that for practical purposes, it would be well to broaden the argument and consider the total market value of the tea instead of the flavour alone.

My above remarks on flavour apply, though with diminished force, to "market value" also. Can your former correspondent cite any authorities, beyond his mere *ipse dixit*, that manure is the panacea he evidently holds it to be? Though after all, I believe in judicious manuring myself and am trying it care-

fully. It will *pay*, I have no doubt, but I rather think my price per lb. will drop appreciably. Though I am aware that this has not been found invariably to be the case, for various reasons.

"PEKOE."

COFFEE SHADE TREE.

Sun-dried *Erythrina Lithosperma* loppings, &c., contains per ton:—

61.50	lbs.	Nitrogen.
57.38	"	Potash.
14.92	"	Lime.
13.68	"	Phosphoric Acid.

Orders should be booked early for the present crop of seed from the parent trees of above analysis at Rs. 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the MANAGER, ARIENKOW ESTATE,

SHENCOTTAH,

Tinnevely.

COFFEE.

Evils of adulteration.

The British Consul at Mannheim says that the coffee market there suffers also from the enormously increased consumption of surrogates for coffee. They are chiefly composed of malt. These "malt coffees" are slightly malted and lightly roasted barley, sometimes also sugared, and needless to say contain nothing whatever of those properties that render coffee itself so valuable. Roasted sugar-beet mixed with chicory is also widely consumed.

Liberian coffee.

The production of coffee in Liberia is increasing enormously. The coffee exported during the fiscal year, 1896, amounted to 600,000lb., while the exports for the year ended June 30, 1896, amounted to 3,000,000lb. Farmers, merchants, and people generally have turned their attention to coffee growing. While no American ships touch at any Liberian ports, yet more than one-fifteenth of the coffee produced is shipped to the United States *via* Liverpool. Coffee is the largest export.

Price of Liberian in the Straits.

The value of Liberian coffee in the Singapore market has fallen so enormously in the last few years (almost 40%), that the local U. P. A. thinks it about time to find fresh fields and pastures new wherein to dispose of its produce. Certainly the present rates, roughly about 50s. the cwt., seem the reverse of satisfactory. Surely it would pay Straits planters far better to send their coffee home than to sell in the local market, judging from the very respectable prices occasionally fetched by Liberian in London.

Nyassaland coffee.

"Free Lance" writes us:

In *P. O.* of 17th ultimo, I see an allusion is made to a wonderful shade tree "discovered" in Nyassaland that "possesses peculiar properties in bringing round exhausted soils, thereby causing coffee that has been worn out by age and cropping to renew its vitality and again become productive." This is very interesting, principally because it demonstrates conclusively that if there is any truth in the statement, they must have worn out coffee in Nyassaland, a thing that would seem incredible if one believes the ordinary current literature on coffee planting in Central Africa. Nyassaland is a very young country to have worn out coffee, considering there is no leaf disease, and it says uncommonly little for its soil or planters, or

both. I see in a recent issue of the *Madras Mail* that Mr. Cecil Rhodes is going in for coffee planting in Nyassaland. Consider Brazilian expert a *sine qua non*. Without pretending to the omniscience of Mr. Rhodes, perhaps it may not be out of place to suggest that something more than 40/- a cwt. might be expected if he employs an Indian expert.

Change of tastes.

In our Tea Notes we have a paragraph headed "Coffee Ousted," which certainly is of grave interest to all coffee planters. It is nothing less than a declaration on fairly responsible authority, that a beginning has been made in the United States in persuading the great coffee-consuming public to change their beverage to tea. What truth there is in the report we cannot vouch for. But as showing the successful pertinacity of the tea planters in forcing their products down other people's throats, it is worth consideration. From a coffee point of view, we can only hope that the present exceedingly low prices of Brazil coffee will enable it to compete successfully with tea. Anyway it seems more than time to bestir ourselves in our own defence, and crack up coffee as tea-planters do their own product.

The outlook in Brazil.

The introduction of European capital into Brazil for the development of the coffee enterprise will be especially useful in this crisis in the financial position of the country, says the *H. & C. Mail*. The low prices received for coffee have greatly reduced the income, and in consequence of this the balance of foreign payments has become still more heavy against Brazil, and the planters are greatly embarrassed in meeting their obligations within the country. All this helps to diminish commercial transaction in Brazil itself, and in turn reduces the volume of importations. It also cripples national industries and diminishes the demand for labour. The Treasury likewise feels the contraction, for diminished imports and lower prices for coffee lessen the revenue. Last year it is estimated that not less than fifty thousand contos of gold (say £5,000,000 to £6,000,000) were lost to the country by the fall in coffee prices, which reduction will be greatly increased this year by the still lower prices. The increased prices for rubber and sugar will counterbalance this to a small extent, but it is highly improbable that it will reduce the total loss for 1896 to forty thousand contos of gold (say £4,500,000). Under these circumstances the recent large sales of coffee estates to European syndicates may be expected to favourably affect the future of the country.

In praise of the berry.

Dr. Gordon Stables, R.N., is a great advocate of coffee. He writes as follows to a home paper:—

"Nothing that can be said in any way calculated to lead to the rational treatment of one of the most common mental ailments of the age is said in vain. Therefore when new papers take to condemning good coffee, under the fallacious notion that it tends to sleeplessness, it is time for medical men to bring them up with a round turn. There are many forms of insomnia in which coffee does excellent service. A cup of this beverage, if well made and of the best quality, has a marvellously soothing effect on the system. It seems to remove congestion of the brain, and, therefore, positive tends to healthful sleep. There is no necessity to become a coffee drunkard, though I don't think ten cups a day would

part one; and a doctor in France, who still attends his patients, although 103 years old, used to drink forty cups of coffee all day long. A huge urn was constantly simmering over the stove. It calmed and warmed us at the same time, and entirely dispelled the irritation of brain and temper that the extreme cold produced. Spirits had the reverse effect. A doctor of my acquaintance used to drink rum instead. He was confined and frozen, and brought home in the foretop. People who sleep badly at night should try to get a snooze by day in a quiet, darkened room, and unless of unusual idiosyncrasy they will find a cup of black coffee help them materially."

SCIENCE AND COFFEE.

BY THE LATE MR. WILLIAM PRINGLE, M.S.C.I.,

SOMETIME AGRICULTURAL CHEMIST IN COORG, SOUTH INDIA,
TO MESSRS. MATHESON AND CO.)

(Reprinted from the Madras Mail.)

III.

THE VALUE OF COFFEE MANURES.

II.

BONES, as mentioned in my first paper, have phosphates, i.e., tricalcic phosphate varying from 39.40 per cent. up to 57.08 per cent. and ammonia from 3.01 per cent. up to 5.23 per cent. Taking the cost of standard quality bones on the coast as, say, Rs. 60, then the value of the sample would be as follows:—

	Standard.	Highest.	Lowest.
Phosphates	48%	57.08%	39.40%
Ammonia	4%	5.23%	3.01%
Phosphates at Rs. 3-4	36%	43.81%	29.55%
Ammonia at Rs. 6	24%	31.38%	18.06%
Total Value Rs...	60%	75.19%	47.61%

The buyer pays Rs. 60 for an article that may be worth Rs. 47.61, or it may be worth Rs. 75.19; there is a money value of Rs. 27.58 between the highest and the lowest. Supposing that 4 cwt. of standard quality bones are to be used and the poorest quality are supplied, it will be necessary to use 4 cwt. 3 qr. and 13 lb., nearly 5 cwt., to make the quantity of phosphates equal, while with ammonia to make it up to the standard 5 cwt. 1 qr. and 9 lb. would be needed, so that to make No. 3 equal to the standard it would be advisable to add 30 lb. of 6 per cent. oilcake to the 4 cwt. 3 qr. and 13 lb. of bones, 3rd quality, to bring it up to the equivalent of the standard. With the highest quality the whole is reversed. Roughly speaking, suppose the phosphates value to be set against the ammonia, the proportions required would be highest 3½ cwt., standard 4 cwt. and lowest 5 cwt. That is to get the money equivalent on the basis mentioned, to get the full manurial value, the manures would have to be adjusted in the case of the lowest, by increasing the quantity used and adding some nitrogenous matter to bring up the ammonia. In the case of the highest the addition of a little more burnt earth or cattle manure would reduce it to the standard, the consumer benefiting in the reduced cost of carriage. The question of carriage is of as great importance in the case of bones as it is with oil cake; and a very little consideration will show that it is worth while to secure a first-class article. In England, if the bones are not up to the standard guaranteed, the vendor pays the cost of the analyses and makes an allowance to cover cost of carriage. One large firm of manure manufacturers, in its annual circular issued to the spring of this year, makes the following allowances:—

15s. 0d. unit for ammonia.
3s. 9d. " soluble phosphates.
2s. 6d. " bone phosphate.

The only stipulations of importance are that the surplus value of one element shall be set against the deficit in the others, if any exists, and that they have the right, if they are not satisfied with the analyses, to have a second one made and to strike the average of the results. Steamed bone flour, as it decomposes more easily, is considered to be worth 5 per cent. more than the raw. Physical condition is in most cases and on the generality of soils very important, and is worth paying for, as it means a quicker action where finely divided manures are used. If manuring can only be done on one-third of the estate per year, so that the whole is only manured once in three years, a mixture of steamed bone flour, raw bone meal, with, if necessary, some fish meal and oilcake to supply the extra ammonia would be a suitable manure, as the materials would not all decompose at once nor at the same rate, but would gradually yield up the food to the plants. The proportions should be adjusted to suit the soil, climate, &c. Where possible, I would prefer annual broadcast manuring.

Fish when pure and dry is a very valuable manure; it decomposes more readily than either steamed bones or oil cake. When ground down to meal it is a very powerful stimulant, and must be used with care. The commercial article is often mixed with large quantities of sand. I have examined some that had 80 per cent. in it, but the following analyses show that with care the sand and insoluble need not exceed 2 per cent. All over this should be deducted from the gross weight, and if it exceeds 5 per cent., an allowance should be made to defray expense of carriage. I also give the analyses of two samples by John Hughes, which represent the ordinary article of commerce, where no limit is placed on the amount of sand. Mr. Hughes found as much as 62 per cent. sand in a sample, and he considers No. 1 to be a fair average of the fish usually imported in Ceylon. No. 3 fairly represents the best quality delivered in Coorg, and the supply is practically unlimited. It could be greatly improved by squeezing some of the oil out of it:—

	Hughes.		Pringle.	
	No. 1	2	3	4
Fish Manure.	Whole.		Fish.	Salt Fish.
Moisture	5.24	13.12	13.78	12.32

Hughes' No. 2 sample is worth a little more. It is usual to consider a quarter per cent. under or over the whole number a fair allowance for errors in samplings, &c., and to pay on each half per cent. It is a fair give and take arrangement between buyer and seller. Thus 10.5 per cent. is paid for as ten and one half, 10.3 or 10.7 at the same rate, but 10.8 is paid for as eleven and 10.2 as ten.

So far I have dealt with readily procurable native manures, but where carriage is very expensive, it is cheaper to use more concentrated manures which can be diluted with burnt earth, or cattle manure or weed compost or jungle soil as may be thought best. In other cases a heavy crop is on the trees and they are to be backed up. A quick-acting manure must be used to enable them to satisfactorily ripen it, and leave the trees fit for the next one. So with leaf disease or anything else that exhausts the trees, quick-acting stimulants backed up by easily assimilable plant food not only help the trees to recover rapidly but minimise the risk of loss of crop. First let us consider a case where carriage costs, say, Rs. 50 per ton, and 6 tons ammonia are to be supplied:—

100 tons oil cake 6 per cent. at Rs. 6 per unit	...	Rs. 3,600
Carriage of 6 tons ammonia		.. 5,000

Cost of 6 tons on the estate		Rs. 8,600
------------------------------	--------	-----------

Equal per ton of ammonia to		Rs. 1,453
-----------------------------	--------	-----------

Ten per cent. oil cake is worth to the planter quite one rupee per ton more than 7 per cent. and a fair price for it would be Rs. 7 per unit ton; 60 tons will give 6 tons ammonia and the cost is:—

60 tons oil cake 10 per cent. at Rs. 7 per unit	...	Rs. 4,200
Carriage of 6 tons ammonia		.. 3,000

Cost of 6 tons on the estate		Rs. 7,200
------------------------------	--------	-----------

Equal per ton of ammonia to		Rs. 1,200
-----------------------------	--------	-----------

A saving of Rs. 1,400 by using 10 per cent. at Rs. 7 per unit instead of 6 per cent. at Rs. 6 equal to Rs. 233 per ton of ammonia delivered. Now if 24 per cent. ammonia sulphate costing Rs. 10 per unit ton is used, only 25 tons are required, one-fourth the weight of 6 per cent. oil cake, a consideration of the utmost importance where the manure has to be carried on the heads of coolies:—

25 tons 24 per cent. ammonia sulphate at		Rs. 6,000
Carriage of 6 tons of ammonia		.. 1,250

Cost of 6 tons on the estate		Rs. 7,250
------------------------------	--------	-----------

Equal to per ton of ammonia		Rs. 1,208
-----------------------------	--------	-----------

By using the equivalent of 100 tons 6 per cent. oil cake with 10 per cent. a saving of Rs. 1,400 is effected, and with sulphate of ammonia 24 per cent. Rs. 1,350 is saved. Where the carriage is Rs. 50 per ton or less, the 10 per cent. hindy has the advantage over the sulphate in cost. It is, however, so much slower in action that when immediate results are to be produced, the ammonia sulphate is decidedly to be preferred. When the costs are nearly equal, the planter must first consider his trees' requirements, and the suitability of the manure to his working conditions, climate, soil, &c. If it is necessary to assist the trees over a bad attack of leaf disease, which by denuding them of leaf prevents the ripening of crop, quick acting manures are essential, and though costing more per unit ton are the cheapest in the end, as they will often repair the damage before it is too late. They should be carefully backed up so that the first good effects are not lost. Ammonia and lime may be looked upon as stimulants, and, like spirituous liquids, must be used with discretion. A little whiskey or wine often aids digestion, but it is advisable to have something in the stomach to digest, otherwise the results are not satisfactory. So it is with plants; if you give them stimulants you must give them other food to digest; they must have phosphates, potash, sulphur, chlorine, iron, &c., &c.

As regards phosphates we have a wide choice. There are raw bones of varying grades of fineness, steamed bones, and bone ash, mineral phosphates, precipitated phosphate, superphosphate, guanos, and fish. Disregarding the native manures, we will just consider the phosphates, pure and simple. They should be in such a physical condition that they may be easily mixed

with burnt earth, &c. Bone ash and mineral phosphate should be sufficiently fine to allow of at least 90 per cent. passing through a sieve of 80 meshes per linear inch. The amount of phosphates in bone ash, according to Macadam, varies from 62 to over 80 per cent. Pure ox bone ash contains 86.34 per cent. and the average of six samples analysed gave 73.5 per cent. It is usually sold on a basis of 70 per cent. It is much more readily taken up by the plants than raw bones and is an excellent fertiliser where phosphates are required. Of mineral phosphates high class Spanish, commonly called Estamadurite, has from 75 to 82 per cent. phosphates. Inferior qualities are often in the market with only 50 per cent. or so in them. Canadian and Norwegian apatites and Aruba phosphates are generally very rich, having sometimes as much as 90 per cent. tricalcic phosphate. There are a great number of others, but these are most suitable, and I prefer Aruba, as it is as soft and as easily decomposed as bone ash, and is generally cheaper. Precipitated phosphates are in a much more beautiful physical condition than it is possible to produce by mechanical means, and they are almost as valuable as superphosphate, the average percentage of phosphates being about 60 per cent. A high class superphosphate with 44 to 45 per cent. soluble is as a rule worth twice as much per unit as raw bone flour; the physical condition is perfection and the food is at once available for the plant.

Trees bearing a heavy crop suffer from a bad attack of leaf disease. We wish to assist them and determine to apply a complete manure. Cattle manure at once suggests itself. The weather is favourable and it is applied. The trees slowly feel its effects and recover, but there is a good deal of light coffee and some of the crop has dropped. We try bones, oil cake and wood ash. The results are much worse than with cattle manure; the mixture is too slow in action. Next superphosphate, ammonia sulphate and kanite are tried. The trees feel the effect at once and throw out a grand flush of leaf; the beans also fill out in a wonderful manure. If we know the composition of the soil we can proportion the manure to suit it and the plants' requirements, and produce the greatest effect at the least cost. In fact, the value of a manure to the tree or planter depends on the proportion in which the constituents are in it, the fertility and suitability of a soil for a given crop depends on the relative proportion that the easily assimilable elements bear to one another and its physical condition. From this it follows that if there is a proportionate deficiency of any element in the soil that is not supplied by the manure, the results will be the least disappointing. The heaviest loss of value occurs when the manure applied has the same deficiency as the soil. A soil is rich in phosphates and nitrogen, and we feel surprised that bones and oil cake produce no results commensurate with expenditure. Cattle manure does much better, therefore the natural conclusion is that it is the better manure for coffee. Probably the addition of a little kanite would improve the bone and cake mixture; but if it did so, it would also probably also improve the cattle manure, and an analysis of the soil would reveal the fact that the soil was short of perhaps magnesium, chlorine, sodium, potash, or possibly sulphuric acid, and it is quite possible that the kanite alone would have given as good results. If to the cattle manure we add what the soil demands to supply its defects we can manure with the certainty (provided the season is favourable) of obtaining good crops and in bad seasons fair ones and a full return for the money spent on manures.

Soil analyses, such as those given by John Hughes and myself, which show the relative proportion of the elements available for plant food, enable the planter to economise in his manuring by applying the necessary manure, avoiding the application of what is unnecessary, and the disappointment and waste of money attendant thereon. To make manuring a success and to ascertain the value of a manure to him on his estate

nter must consider the following five points:—his Soil; his
duce; Carriage; Capital; and Labour. Without the last
o, manure and manuring are impossibilities, and if the
ply of these two necessities is limited, the planter must cut
coat according to his cloth. If the supply is insufficient a
nter's best efforts are often cramped, and he has to work
en he can, not just when he wishes to, and when he knows
will get the best results. Work well done at the right season
the cheapest in the end, and manure best adapted to the soil
d produce is the most economical to use.

TEA.

the new Travancore
Company.

Thus speaks the *Times of Ceylon*
of the Travancore Tea Estates
Company :

The new company, in which Ceylon men are chiefly interested, has
st been floated, and some additional particulars are given by our
ondon correspondent to those we have mentioned already. Mr.
Mackenzie is the principal vendor, and the members of the
ard of the Ceylon Tea Plantations Company are largely directors
the new company, which, as "A. L. H." says, should benefit the
perintendents of Ceylon's premier tea company. With reserve
nd selling for £3 an acre and tea in cultivation at £39 an acre;
hile it costs only 3½d. to put on boardship tea which sells for 8½d.,
is not strange that Ceylon capital is finding its way to Travancore.

results of manuring. The following facts show what
manuring can do, aided by liberal
ltivation. The jat of tea experimented on is decidedly
t high, while it should be noted that the land has been
ractively lying fallow for some years past, and is a high
levation Nilgiri garden. Half a bushel of cattle per tree
as the dose. The land was partly deep hoed, partly
renched and partly pitted. The maiden flush (tipping)
as 410 lbs. of ¾ acre. Off 7 acres, medium pruned,
225 lbs. leaf were taken, and this with very light pluck-
ng. The land has been hoed twice since, and the
prospects of the next few flushes are excellent.

Reason of glut in
brokens.

It has been frequently pointed
out in these columns that broken
teas have been persistently falling
n price in the London market. This has been partially
explained by the fact that there is no demand for these teas
n the foreign market. The fuller reason is that the direct
export from India and Ceylon to the various foreign markets
s becoming a very important factor in relieving the home
rade of the re-export business. And, as the only teas that
sell outside of the United Kingdom are whole leaf teas, the
proportion of broken teas finding its way home has become
altogether too large for the consumption there. So that
every care should be taken in withering and manufacture to
render the inevitable proportion of "brokens" as small as
practicable. We presume the reason of our foreign customers
disliking broken teas, is twofold. Firstly, that with regard
to the China tea they have hitherto been using, broken teas
are almost invariably adulterated teas. Secondly, that they
find the whole leaf tea makes quite as strong an infusion as
they care for. To young tea-makers we would take the
liberty of suggesting some very simple modes of avoiding
an undue proportion of brokens: wither harder, roll lighter,
and be careful about over-handling your tea either with
sizers or sieves.

Coffee ousted!

The directors of the great Tea
Campaign, now raging all over the
world, have till recently contented themselves with opera-
tions against Chinese and Japanese Tea, and with
phenomenal success. They seem to have gone one better
in the United States, according to Mr. K. Parson's letter
to a Ceylon contemporary, and are converting coffee-drink-
ers into tea-drinkers! This is what Mr. Parson says:

When the consumption of Ceylon and India teas in this country
is talked about, it seems to be understood that tea drinkers are the
only ones that will drink Ceylon tea, and that to reach these it is
necessary to change their tastes from the tea they are drinking at
present to that of Ceylon. But, besides the regular tea drinkers,
there is a large majority who seldom or never drink tea, and I am
convinced that, of these, there are a great number who will become
drinkers of Ceylon and India teas. This has been my experience
during the past ten years, during which time I have, amongst my
private acquaintances, introduced Ceylon tea to those who seldom if
ever drink a cup of tea, and who now use tea where formerly they
used coffee. If the committee, who are engaged in looking after
the planters' interest will bear this in mind they will see what a
future they have before them in this country. As one of my friends
remarked, "Ceylon tea is thicker and supplies the place of coffee to
me, where the tea I formerly drank appeared more like hot water
with a little flavouring in it."

This, with the new tea laws (the gist of which we reprinted
in our last issue) to be introduced, will serve well enough to
keep up the market average to a paying figure.

Tea as an investment.

We do not wish to deprive the
pessimists who are apprehensive
about the stability of tea as an investment of a solitary
lamentation, says the *H. & C. Mail*. They have been telling
us for years that tea is a "risky kind of thing, you know,"
and that it is "overdone," and lately it has been "wait
until China wakes up." But somehow their gloomy fore-
bodings have not been realised. Some people will prophesy
evil on the slightest provocation and out of pure cussedness.
To these the reports of the various tea companies now
appearing must be quite unpleasant reading. With few
exceptions there is a regularity about the result which
must prove as gratifying to the investor as it is
irritating to the croaking fraternity. Tea shares in well-
selected companies are now looked upon by investors,
who formerly ignored them, as worth attention, not
only because the concerns are, as a rule, remarkably
well conducted, but also because the accounts and every-
thing connected with them are presented in a businesslike
way. The professional financier may occasionally take a
hand, but on the whole the industry and all connected with
it are in a wonderfully healthy condition. If tea should be
"overdone," to use the language of the warning voice, or
if the consumption should decline, or if the few other evils
to which all industries are subject should at any time occur,
the position, even then, will not be so black as some would
have us believe. Even the sweet simplicity of Government
securities and Colonial bonds is subject to fluctuation, and
the timid who scent danger at all points will do well to
keep their savings in a stocking.

The market.

It is usual among tea-enthusiasts
to convince unbelievers and outsiders
of the soundness of the tea market, by referring them to
the "average London price" for Indian teas during the
last four years. How can one affirm that the market has
appreciably fallen, they say, in face of the constant figure

averages for India? Yet if one thinks a little, and considers all the facts of the position, the optimistic argument is rudely overturned. It is a very well-known fact that the leaf plucked is uniformly of far finer grade than used to be the case some half-dozen years ago. Consequently the average tea now on the market is of much higher value than formerly, though the average price remains at very much the same level. We are here addressing so called paper experts rather than tea-planters, whose knowledge of the fall in the market is too intimate to be argued over. Or else we could cite dozens of instances of well-known gardens whose teas have steadily fallen in price, despite the utmost care and attention in manufacture, the plucking alone remaining constant; and, notwithstanding the constant assertion of the brokers that fine teas always command full prices, the term "full" must be taken only and in its relative sense, *i.e.*, as compared with the prices of the commoner sorts. Turning to Ceylon the question is even simpler. For these the plucking has remained very much the same as it used to be some four years ago, and the average price of Ceylon tea has fallen. The reason wherefore has been eagerly sought in the Island press, the general impression being the obvious one that the great increase in production has resulted in a very natural fall in price.

PRODUCE AND PLANTING.

Peru and the Tea Trade. As those interested in India and Ceylon tea are always on the look out for new markets, a forthcoming exhibition in Lima, Peru, should attract attention. We see from the *H. & O. Mail* that there is some scope in South America for pushing the sale of tea. That the present Government of Peru is anxious to do all in its power to foster and extend the trade of the country is shown by its action in promoting a permanent Industrial Exhibition, which is to be opened at Lima this summer. In order to ensure the success of the undertaking, a section of the Exhibition Palace at Lima has been set aside specially for it, while the whole of the arrangements are in the hands of the Minister of Public Works. Goods and exhibits from all parts of the world can be shown, and manufacturers in Great Britain are to be invited to send goods, the Government undertaking to admit free for six months all exhibits. Should any of our readers desire to be represented, they should communicate at once with Mr. K. B. Crowe, Consul-General for Peru, 13, King Street, Liverpool.

By the Mail.

The following dividends of tea companies have been declared in Calcutta:—Shakomato Tea Company, $7\frac{1}{2}$ per cent.; Loobah Tea Company, Limited, 8 per cent. Mr. A. Philip, Secretary to the Planters' Association, in a letter to the Ceylon papers on the prospects of Ceylon tea in Russia, states that the quality of Ceylon tea is not what it used to be, and declares that the maintenance of quality is a vital question if the permanent conversion of new markets is the object in view. The Russians still prefer China tea, and it will only be by sheer excellence that Indian producers will be able to supplant the Chinese. The *Ceylon Observer* states that the latest venture is the Oodoowerre Estates Company of Ceylon, Limited, with a nominal capital of Rs. 5,00,000, divided into 1,000 shares of Rs. 500 each. Blairavon

Estate, Maskeliya, has been sold by Mr. W. Blair Brown to Mr. J. Shannon Stevenson for £8,500, and Margherita Estate, Maturata, to Messrs. Fallen and Gregg from Australia. A general meeting of the Lady Havelock Gardens Company, Limited, was held at Colombo recently. The first block of the Lady Havelock Gardens has been purchased from Government, and buildings are to be put up shortly.

Last Week's Tea Market.

At the opening sales on Wednesday, about 14,400 packages were offered, says the *Produce Market Review*, referring to last week's tea sales. The demand was fairly active, which was due in a great measure to the reduction of stocks held by the dealers during the past two or three weeks. Nearly the whole of the teas offered consisted of the medium and lower grades, and for the more useful lots there was good competition at prices quite equal to those current before Easter. As the supply of these better descriptions is now much reduced, present rates will probably be maintained for some little time, but the rise anticipated in some quarters is not likely to occur in the face of the heavy imports of Ceylon. The less desirable sorts, and especially many of the Calcutta bought teas, were comparatively neglected, values being irregular with a downward tendency. The finer kinds were poorly represented in the sales, and as there is only a very limited quantity to come forward, there is every indication of a strong and probably rising market during the next month or two. The large and disproportionate stock of broken tea of most grades has for some time had a depressing effect on prices for these descriptions, but they have now fallen to a point which should attract attention from the trade, as they undoubtedly offer exceptionally good value. The cause of the comparatively small demand for these teas during the past season is attributable to the cheapness of the whole leaf kinds, and to the small and dusty character of a considerable portion of the former. Of the 14,348 packages catalogued for public sales, about 12,700 were sold, and the quantity advertised for next week is much larger. After a fortnight's interval the first sale of Ceylon tea since the holidays was held on Tuesday last, when a large quantity was brought forward. A good feeling prevailed, and notwithstanding the heavy supplies, the market was well supported, the bidding showing more animation than has been apparent for some little time. Teas for "price" were particularly firm, with an upward tendency, and only a limited quantity was to be procured under $5\frac{3}{4}d.$ per lb. Medium Broken Pekoes generally maintained previous rates, as although in some cases a slight reduction was noticeable, no alteration can be quoted. Whole leaf kinds continue in request, and a good business has been transacted in them at about former quotations. The quantity generally is by no means all that could be desired, but the sales contained a larger proportion of good tea than has been the case of late.

Metal Tea Chests.

The metal tea chest industry, represented by the Acme Tea Chest Company, Limited, appears to be in a very thriving condition, says the *H. & O. M.* Under the title of the Acme Tea Chest Company, Limited, a new company has just been formed to take over the business of manufacturing and selling steel tea chests, hitherto carried on by

the Acme Package Company, Limited, together with the premises, plant, machinery, and assets. The prospectus of the new company states that the business of the vendor company has, since its formation in 1894, developed to a remarkable extent, and is still rapidly increasing. The capital of the new company is £150,000 in 50,000 six per cent. cumulative preference shares of £1 each (preferable in regard both to capital and dividend), and 75,000 ordinary shares of £1 each. Of these one-third are to be issued to the vendor company as fully paid in part payment of the purchase price, the remaining two-thirds—viz., 50,000 six per cent. cumulative preference shares and 50,000 ordinary shares—being now offered for subscription. The prospectus states that the company recently acquired a few extensive and very suitable works, with convenient railway connections, at Polmacie, Glasgow, which previously formed the Glasgow Steel Works. These works, having been reconstructed and equipped with special and valuable machinery, are thoroughly adapted to their purposes, and are equal to an output of from 20,000 to 40,000 chests per week. The formation of a new company with larger capital has been resolved upon mainly with the object of putting the company in a position to manufacture its own steel sheets, not only for the sake of the large profit to be earned by so doing, but also to insure an ample supply of high-class steel sheets—the output of chests being now so large that it has been found extremely difficult to buy a sufficient quantity of sheets of the special quality of practically unpuncturable steel which is necessary to make a thoroughly satisfactory metal chest. The prospectus also states that for the season ending June 30, 1897, orders have already been obtained to the amount of £42,000, from which, according to previous experience, a profit of £8,200 should be made. For season ending June 30, 1898, it is confidently expected that the total sales will considerably exceed this figure; but assuming that no increase upon sales is attained, and that the saving before referred to arising from the company manufacturing its own sheets—viz., £4,000—is effected with sufficient expedition to make itself apparent next year, the total profit would, at the same rate as in the previous year, amount to £12,200, sufficient to pay 10 per cent. on the ordinary shares after making provision for the dividend of 6 per cent. on the preference shares.

The Planting Industries of Mexico. At a recent meeting of the Mexican shareholders of the Mexican Coffee Trading and Planting Company, says the *H. & C. Mail*, it was mentioned that there are already 1,500,000 coffee plants in the company's nurseries, which will be ready for transplanting this year; 60,000 one year and a half old trees have been planted, and are in good condition. The American Consul at the City of Mexico says, "That, striking as are the facts with regard to the increase of the cultivation of coffee and the growth in the United States of a great appreciation of the Mexican berry and its sterling qualities, these can be paralleled in many points by the development of Mexican tobacco." Although France has not profited commercially by this increase, it is only simple justice to say that it is due very largely to Frenchmen and to the exiles from Cuba whom they employed. "In a word," says Consul Crittenden, "Mexico is not only one of the coming coffee countries, but is also a coming tobacco

country. Mexico seems to be destined to wear the mantle of Habana in tobacco production, and once secured, it is safe to predict that it will never pass away, for the soil of the tobacco region is so deep as to be practically inexhaustible, being from 8ft. to 20ft. in depth, and in some places even 30ft. Moreover, its extent is probably one hundred times that of the Cuban tobacco region, when we take into consideration the fact that acre for acre the percentage of cultivated land at the present moment capable of producing tobacco of the very highest grade is greater in Mexico than it ever was in Cuba in its best days. We can from this easily see what will be the amount produced in the future. Mexico's resources in this direction are practically so great as to make it certain that it will become rich from its tobacco alone. No doubt the result will be finally to cheapen the Habana cigars, and put them within the reach of all."

PLANTING METHODS IN CEYLON.

WE have several times drawn the attention of our readers to the interesting series of letters that have been appearing of late in the *Ceylon Observer* on the subject of the plucking, pruning and preparation of tea. The correspondence was started with a view to bring to light, if possible, any generally unsuspected and preventible causes of the continuous decline in the price of Ceylon teas. The series having closed, our contemporary ably reviews the information gained in the following words:—

On the question of plucking, the general conclusion at which we arrive is that, while shrewd and experienced planters differ, whether coarse plucking is on the increase or not, being chiefly guided in their opinion by the practice of their several districts, there is practical unanimity that the principal cause of the increase of the coarser qualities of teas, is the extension of estates in the lowcountry. The acreage under tea in the lowcountry has been extending much faster than the hill districts, and as hot steamy places yield quicker and heavier flushes than those at high elevations, there has been a preponderance of teas of the lower qualities as compared with high-grown flavoury teas. Whether that fact supplies a full explanation of the fall in average prices may be doubted. It unquestionably explains the fall to some extent. Among the other causes must be mentioned the undoubted fact that a large number of estates go in for quantity, and the equally undoubted fact that scarcity of labour leads to delayed plucking by which much of the finest flush is lost. The latter fact is not of the planter's own making. Scarcity of labour leads to alternatives—the plucking of fields at longer intervals than one would of choice, and the abandoning of some fields for a season, with the immediate result of estimates running short. It can scarcely be expected that a superintendent would care to incur the latter risk, except under express instructions. It may be as much as his place is worth! Coarse plucking with a view to maintain a high rate of yield is matter of choice; and it has been defended on the ground that it pays. That the system is more remunerative than medium, or even fine, plucking has been denied; but clearly, there can be no hard and fast rule, and the plucking which pays best on one estate or in one district need not necessarily be more paying on another. It is useful, however, to remember that 10,000lb. at 6d. may really leave less to the proprietor than 9,000lb. at 6½d. Against the gross gain—£6. 5s.—must be set the extra cost of plucking, manufacturing, packing and transport of 1,000lb. of tea which may swallow up the whole of the apparent gain. Apart from that, there is the influence to be reckoned on the market of a diminished output and of an improved average quality. A reduction in the outturn of 1,000lb. here and 1,000lb. there can scarcely affect the general average of prices for the whole island: but the reduction of the exports by one tenth, now that they have topped 100 million lb., would mean an appreciable quantity off the market.

The general consensus of opinion is against severe pruning which has been described as hacking, and which, we are glad to learn, finds fewer adherents year by year. It is admitted, however, that at in-

tervals—the longer the interval the better for the bush—there must be a change from light pruning; but experienced planters distinguish between heavy pruning and cutting down or hacking. There is no change in the old belief that the liquor is weak for some time after pruning—the weakness and the duration corresponding to the severity of the pruning. Intimately connected with the influence of pruning is that of manuring, which some writers have stated has the same effect of weakening the liquor. The balance of authority seems to be against this view. Not only so, but also in favour of the opinion that the liquor is strengthened by the greater robustness of the bush which manure induces. This strikes us as the more reasonable view; and our explanation of the alleged debilitating effect of manuring is that that effect is produced, not by the manure at all, but by its unskilful application, causing injury to the feeding roots. The majority of writers deny any evil effect on the flavour of tea by manuring, and claim that a sappy leaf, which a few planters condemn, produces a strong flavoured liquor. However that may be, there can be no question that manuring increases the crop: that preference is felt for bulky manures, if they can be got, over artificial, and that, although the good sense and habits of observation of our planters have protected them from disastrous blunders, a good deal yet remains to be learnt of the needs of our soils and the constituents of manures, before it can be claimed that our tea-fields are receiving the best treatment possible for crop and for flavour.
